EXTRACT

From an Act prescribing Rules for the Government of the State Library,  
passed March 8th, 1861.

SECTION 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof; and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

SEC. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State, who are required to keep their offices at the seat of Government, the Justices of the Supreme Court, the Attorney-General, and the Trustees of the Library.

VOLUME XXXV.  
Number 1.

## Calculating Machines.

The calculating machine shown on this page is designed to assist in all kinds of computation where multiplication and division are material parts of the work. It is a small instrument nicely made of metal, doing its work in an automatic manner and giving its results in plain figures. The portions of the work most likely to mental error are taken by the mechanism; no parts of the adding, carrying, or transposing are left to the operator, who is simply responsible for the correct setting up of the data and the correct taking off of the result. The labor usually required of the brain is here transferred to the hand. With a machine of this character time is saved on almost any description of work.

The calculating machine—though the De Colmar instrument is well known and highly valued in Europe—is almost an entire novelty in this country. But one American maker has attempted to introduce such a thing, and the few machines now in use by the larger insurance and railroad companies have been imported by their purchasers. The new machine here presented is American in invention and manufacture; and, though first produced in 1870 and patented in 1872, none were sold until 1876, and it was not perfect for general sale until 1877. Its first appearance in public was at the Centennial Exhibition, where it received a medal and diploma. The report of the judges was extremely favorable to this machine, they deeming it superior to all other instruments in its class yet produced. At a trial at the Franklin Institute it received the "Scott medal." The committee reported that "the machine works with rapidity and certainty, is composed of a comparatively small number of parts, is substantially constructed, not readily disarranged, and easily operated, effecting a saving of time of over sixty per cent. over ordinary methods, and relieving the mind from any strain, as well as removing all doubt of accuracy. It meets the requirements of practice more fully than any other machine designed for a similar purpose." The engraving will give a general idea of the appearance of the machine, and serve to illustrate the following description. Its size covers five and a half by thirteen inches on its base, and it is about seven inches high. The works are made entirely of metal, mounted on a polished wooden base board. The working parts are steel, and all striking and wearing parts are of tempered steel. The hearings are steel and brass working on cast iron. The gears and cranks are of brass, and the frame of iron. The frame, gears, slide, cylinder, crank and all parts that are to be handled, are nickel plated and polished and will not tarnish or rust. The figures on the rings, on the slide and on the wheels in the lower shaft, are stamped in the brass and filled in with black; they show clear and distinct.

All numbers to be read are shown in a prominent position, in large figures, in their proper order. All the mechanism being in full view, and easy of access, there is no cheap hidden work on the machine. There are but 150 separate pieces of mechanism, half of which are operative or working pieces, and not one of these can be called small or delicate, either in construction or action. It is not liable to get out of order by careless handling. The machine can be thoroughly understood by any one, and repaired by any ordinary machinist or clock repairer. Its action is positive, uniform, and free from sudden motions. It runs with hut little noise.

The large upper shaft, or cylinder, is hollow and empty; it is rotated by the crank, and, by means of the gear, rotates the lower shaft. On the cylinder moves a slide, which, by means of a click, can be fixed in eight equidistant positions. The slide carries eight figured rings, each of which can be quickly set by hand to read either 0 1 2 3 4 5 6 7 8 or 9. The lower shaft carries ten figured toothed wheels, each running on a hub, which is pinned to the shaft. Each wheel has a friction disk bearing against it all around, and between it and the next is a single steel lever used in carrying tens. Between the two rotating shafts is a set of ten steel claws, by means of which any number set up on the rings in the slide is added to the toothed wheels underneath at each turn of the

crank. The click at the further end, unless held down, tends to stop the machine at a fixed point. Before starting any computation, the registering wheels must all be brought to read zero, and this is done in a second by a half turn backwards of the crank.

The following is an example in multiplication: Example— $367 \times 493$ . Set up 367 on the three upper adding rings, and turn three times; shift the slide up one shift and turn nine times; shift the slide another notch, and four turns will complete the operation and show the result, 180,931, in plain figures on the recording wheels. The eight-figure machine carries eight adding rings and ten recording wheels. Any result of ten or less figures will be shown in full, but if there are more than ten places, only the upper ones will be shown.

An index to record the multiplier is a convenience and a check upon error in turning, but, as it is merely an accessory, it is applied only when specially ordered. To multiply above eight places into eight places directly, a larger machine is required; but by dividing the factors into sections, and adding the partial products, problems of any extent may be worked.

A special machine is made for the special case where formulae is worked, in which one set of factors,  $a, b, c, d$ , etc., are the same for a large number of computations. It is of the same general design as the ordinary machine, but instead of a slide carrying a single number, there is

GRANT'S CALCULATING MACHINE.

a slide capable of carrying several separate numbers. Either quantity can be quickly brought into working position, without being set up anew, and each product as found adds itself, or subtracts itself, to those already recorded, saving much time and labor, and ensuring rigid accuracy. At the same time, the compound machine is useful for ordinary work, for the compound slide takes off, and is easily replaced by an ordinary slide.

The following is an example in division: Set up the dividend, 180,931 for example, on the wheels, either by transferring from the rings, or by turning the wheels by hand. Set up the divisor, 493, by the smaller figures on the upper three rings, setting it as 492, the units place always one less. Now, it is apparent that 4.9, or, roughly, 5, will be contained in 18 about three times, and three turns of the cranks will obtain the first quotient figure three. The second and third are obtained in precisely the same way. The quotient 367 will have recorded itself automatically on the uppermost recording wheels, and the lower wheels will show the remainder, if any. An index is useless in dividing.

The machine has an advantage of three to one over common logarithms, in points of time, ease and accuracy. It is much easier and quicker to work with natural sines, tangents, etc., and natural numbers upon the machine, than to use the common logarithmic method. It is only in the case of roots and high powers that the logarithmic method is equal to the mechanical.

These machines cost from \$100 to \$200, and are manufactured only by the inventor, Geo. B. Grant, 94 Beverly street, Boston, Mass., who will furnish further information to those desiring it.

## Mining in Amador.

We are informed that they have passed through the ledge of the Doyle and Ida mines, situated in Hunt's gulch, near Jackson, Amador county. The vein appears to be about 38 feet in width, between the walls. The quartz which carries the sulphurets is about five feet in width. The rest of the ledge contains free gold. The prospects are said to be as rich as any in the State. The further they get into it the more it improves. The ground can be cheaply worked by water power, there being from 400 to 500 feet water pressure. A mill and other machinery will be erected as soon as possible.

We are told that with a small force of men they can take out nearly 100 tons of ore every 24 hours. The discovery of these two mines was made by William Doyle, an old Californian, and Capt. Beck. The management of the mines will be conducted by the latter and Capt. Weeks, both of whom are favorably known as Lake Superior miners as well as in mining districts on this coast.

There are many such mines as these in this State in which capital could be advantageously invested. Legitimate enterprises in California will be found to be more profitable than stock gambling ventures in the long run. By opening up the riches of the interior of the State

## Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening, Professor Davidson in the chair. A donation to the cabinet was received from Thomas R. Bard, of Huencme, Ventura county, California, accompanied by a letter of explanation, in the shape of specimens of fish, supposed to be trout, thrown up from an artesian well 141 feet deep, hored in the sand-hills near that place. The well, which is nearly 300 feet from high-water mark, was hored in 1871, and every year since has thrown out immense quantities of freshly-spawned fish in April and May. The first fish this year were observed in March. The well is capped, having three 2-inch apertures, from one of which people were in the habit of filling barrels with water for household uses. In that way the presence of fish was discovered in 1872. The cap was removed, and fish were ejected in incredible quantities, until the cap was replaced. In a huckelful, one-fourth of the weight of the contents was fish. It is proved that these fish have appeared every year, but it was only recently that much attention was paid to the phenomena. The pipe is badly rusted, so that one-half of the water escapes and exudes from the surface, carrying up fish, which are forced by a strong current through conduits into small lakes, where sea birds eagerly devour them. These fish are of various sizes, the largest about an inch in length. The nearest stream where fish are found is Santa Paula creek, 25 miles from the well, but it empties into the Santa Clara river, distant seven miles, at a point 20 miles distant. Fish cannot live in that stream on account of the ever shifting sands in its channel.

In regard to this fish story, Prof. Davidson said he knew Mr. Bard, and had no doubt that he had not been deceived. Something of the same kind was observed in Santa Clara county, near San Jose, where redwood sawdust was thrown from the artesian well, many miles distant from the mills in the mountains on the west side of the peninsula.

Mr. Stearns read an obituary memorial of Dr. Carpenter, corresponding member of the Academy.

Dr. Kellogg read a paper on a new genus of shrubs from the coast of Lower California, dedicated to the collector, the late Dr. J. A. Veatch, *Veatchea fruticosa*. This shrub probably has medical value, as the bark is intensely bitter.

Dr. Kellogg also read a description of a new composite shrub, *Trixia Concolor*, recently collected by Mr. Fisher, near Mazatlan, Mexico; also, a new *Enothera*, or a species of primrose, *Enothera rosaculata*, collected by Mr. J. Muir, in the Sierra Nevada mountains.

Prof. Davidson read a paper on the breakwater of Alderney, and gave his conclusions from his previous papers on harbors, as to the best, safest, most readily applied and cheapest plan for breakwaters and harbors of refuge on the Pacific coast.

The resignation of Edward F. Hall, Treasurer, was accepted.

Dr. Stout introduced Dr. L. Savatier and Mr. Leon de Cessac, from the French frigate *Magicienne*, to whom the usual courtesies were extended. It was stated that Dr. Savatier had superintended a botanical survey of Japan, and Mr. de Cessac was on a government mission to look after the natural history during the expedition.

The shaft of the Eureka claim, at Grass Valley, has been covered over and work suspended. This mine has been one of the best paying properties in California. It was opened in October, 1865, and has produced about \$4,500,000, of which \$2,094,000 has been paid to stockholders in dividends. There have been no assessments. This is the second Grass Valley mine abandoned within the past two years, the other being the North Star, once a prosperous dividend paying claim, which many believe has never been worked out.

The famous Silver Islet mine, on Lake Superior, has come to grief. Trouble between share owners and the bondholders has culminated in shutting down the mine. Besides this it is said that while the vein continues large, the percentage of silver is growing discouragingly small.

## English Lead Mines.

Amongst the oldest of our mining industries is that of lead, which in some of the British districts has been worked from remote antiquity. It has not known the marvellous growth that some mining industries have; but the mines and the districts which produce our lead have kept us well up in the race for production, although we have had to compete with Spain, with America, and other countries. For more than a score of years the mining records show that we have produced from 73,000 tons to 101,000 tons of lead ore; and although the production of ore has not been increased of late years on the average, yet the lead we have extracted has, on the whole, increased proportionately. And in other respects there has been great improvement in the condition of the lead-mining industry in those years, inasmuch that it may now be said that, instead of being produced haphazard, it is now carried on with the help of many of the more recent discoveries in metallurgical science. The facts in regard to our output of lead, and to the sources from which we derive it, may be succinctly put.

At the date of the most recent official return there were 304 lead mines in the United Kingdom; and the produce for the latest year for which the figures are attainable was 77,746 tons of lead ore, or about 57,435 tons of lead; and in addition, 487,358 oz. of silver. Confining our figures to lead ore, we find that the greatest producing district was that of Durham and Northumberland, which brought to bank 22,304 tons of ore—the bulk from the Allendale, Wear-dale, and Teesdale mines. The next contributor is Montgomeryshire, which gave 8,949 tons. Then follow, in turns, Shropshire, with an output of 7,932 tons; Cardiganshire, which yielded 5,835 tons; the Isle of Man, from whence we extract 4,429 tons; Scotland, which as a whole gives us 4,109 tons; Yorkshire, yielding 4,049 tons; Flintshire, 3,003 tons; Derbyshire, 2,600 tons; Cornwall, 2,566 tons; Derbyshire, 2,283 tons; Cumberland, 2,128 tons; Ireland, 1,850 tons; Westmoreland, 1,646 tons; Somersetshire, 1,546 tons; Carnarvonshire, 1,408 tons; and one or two districts or counties giving outputs of under 1,000 tons each, by which the total is raised to that previously given—77,746 tons. It may be noticed that the productiveness of these districts is not to be measured by the number of the mines; for Derbyshire, with 86 mines, has an output of only a tenth of that of Durham and Northumberland, in which the number of mines is only 21. In Derbyshire, 28 mines each produce less than 1 ton of ore yearly; 53 produce less than 50 tons in the year, and only 5 produce above 100 tons each; but in Durham and Northumberland, the least productive mine brings out 12 tons, and one in Wear-dale gives above 4,000 tons. It should, however, be stated that to our home production of lead we add a considerable amount imported from abroad. Deducting our exports from this, there are to be added to the produce of our own mines above 11,000 tons of lead ore, and 57,000 tons of pig and sheet lead; but our exports of lead in a manufactured state exceed our imports by about 7,000 tons. Our chief imports are from Spain and Italy; our exports are largely sent to Russia, China, and France.

Of our lead-mining districts, the chief, as previously stated, is the northern one—a tract of about 80 miles long and 20 wide, ranging from near the Roman wall down into Yorkshire. There the mines at Allendale and in Wear-dale have given for generations princely incomes to the Blackett and Beaumont families. The rich mines of Teesdale have similarly repaid the company chiefly working them, and in Swaledale great results long followed the working of the mines, one of which, at least, has been supposed to have been worked by the Romans. The mines in the slaty rock strata of Devon and Cornwall have been similarly productive; whilst the hilly ranges in Cardiganshire and Montgomeryshire are intersected by lead-bearing lodes; and in other parts of the kingdom there are inducements to the adventurer in lead mining sufficient to give ground for the belief that our productiveness as a lead-yielding nation will be long continued. The industry, it may be remarked, has not of late been so much subject to fluctuations as of yore; the price and the quantity of the output have been on the whole steadier, and as there is now an attempt to work the most important districts in a more systematic and less wasteful manner, as well as to use the local fuels, it may fairly be expected that these conditions of prosperity will be continued, and that though the demand for lead may not be largely extended, the industry will know an increase of prosperity in common with other mining adventures.

Many of the mining-districts are isolated, and at considerable distance from railway facilities; and from this cause and the nature of the employment, the communities are isolated. The fact that in most of the lead mining districts there are few if any other industries except agriculture, and that lead mining is looked to for furnish employment for the bulk of the population, and that in some of the processes of purification of the ore children have been long employed, has kept wages down, and the average for a large mining district was stated at considerably under £1 per "week." The "week," however, in this case, was one of 40 hours' work—the nature of the employment and its unhealthy character making it undesirable to

work longer at it—and some of the remaining time was often employed in gardening, in tending small grazing farms and in other modes. In the north, this mode of partial work is common in the lead mining industry, and it is also common for the work done to be paid for on the piecework system—a weekly subsidy being, however, paid to the men during the long engagements. Many of the customs in the lead mining dales are exceedingly quaint, and the isolation of some of the communities render the customs and habits of the population exceedingly primitive—the employment descending from father to son for many generations. The mode of working the mines was long a most wasteful one, and there was an indisposition to make use of the newer modes and machinery; but now, in the most productive dales, not only have improved processes been generally adopted for the purification and the smelting of the ore, but there have been successful attempts made to use the vast stores of peat fuel which are often found in the neighborhood of lead mines, and which have been applied, not only as a fuel, but to furnish light. The result is to cheapen the cost of production, and so to enable the smelter of lead to compete more favorably with other districts. For years the demand for lead for type-founding and pipe-making, as well as other purposes, has been steady, and there are indications that it will be increased. The competition with other nations is greater now than it was, but the more systematic and economical working of our mines will enable us better to meet it, as well as to produce a larger output of lead; so that looking to an increased supply of ore, a plentiful supply of labor, and an increasing adaptation of machinery, the prospects of the lead mining industry would appear to be promising.—*London Mining Journal.*

## American Locomotives in England.

Two months ago a locomotive was shipped from this country to England, and recent Hull papers comment on the fact with some wonder and some apprehension. It was a cheap engine, valued at less than \$7,000, but it is the first export thither of this kind, and is quite likely to be used as a model for British imitation. In the fiscal year 1875 our exports of locomotives to North and South America, Russia, Turkey, and Cuba were valued at about \$1,000,000. They numbered 70, and were taken by nine several countries. Since 1870 we have shipped 400, valued at \$5,500,000—the greatest numbers being 72 in 1872, and 79 in 1874, and as many the following year. The values ranged between \$341,794, and \$1,147,366, and, according to the *London Engineer*, they "are cheaper than English locomotives, do as much work, and do it as well." In addition to the propelling power, this country now exports palace cars to England and the continent; has sent street passenger cars and large quantities of car wheels, and the American passenger railway car is running on some English and several European roads. Our freight car has found the same markets; and the cars having won their way for street and railway service, the recent assertion of the *London Engineer*, that at present rates a first-class American locomotive can be placed on an English road complete for \$9,000, when the best English cannot be bought under \$12,000, would seem to show that our locomotive shops are able to equip English roads with better, and stronger, and faster engines than English works can. We are not advised whether the locomotive lately shipped is for service or as a model. The latter supposition is somewhat improbable, as the manufacture would require American mechanics, tools, appliances, and perhaps American iron; it is more likely that British engine builders are losing the patronage of their own roads, and that the import of American locomotives has commenced. Whichever is the case, the success of this model can hardly fail to be followed by new orders, since neither in mowing, reaping, sowing, nor in any other machinery have English mechanics succeeded in uniting the strength, beauty, and speed of American models. Having superiority of this nature, and greater endurance, we may rationally hope to find a market in Great Britain this year for more machinery; and winning a share of that business, we may turn to the continent and anticipate the return of more interest bearing bonds. The beginning promises well for industry and commerce.—*Philadelphia North American.*

SEPARATING NICKEL FROM ORES CONTAINING IRON.—Considerable difficulty having been met with in separating nickel from ores containing a large quantity of iron, the following method was adopted: The ore was dissolved in *aqua regia*, the silica separated; to the filtrate ammonia was added in excess, the precipitate of iron well stirred, filtered and washed with ammoniacal water; the iron redissolved with hydrochloric acid, reprecipitated with excess of ammonia, and treated as before. The two solutions were added together, and boiled to expel excess of ammonia; solution of potassa hydrate was then added and the solution heated till ammonia was no longer given off, the solution filtered, the precipitate well washed with hot water, redissolved in acid and reprecipitated by potash, washed, dried, ignited and weighed in the usual manner. Care must be taken that no copper is present during the operation. By this method better results were obtained than by the usual way.—*Chemical News.*

## New Mexico Mines.

The time is rapidly approaching when New Mexico mines will, says the *Engineering and Mining Journal*, attract no small amount of attention. All who have visited that distant Territory unite in representing its mineral wealth as great as that of any part of the West. Evidences have been found in many places of ancient mining works, showing that the people whose remains in the shape of ruined towns, acequias, fortifications, and burial mounds are so plentiful also possessed some rude ideas of mines, and probably worked many of the copper and lead deposits now known, as well as washed in the gulches for gold. New Mexico was in fact known as a mineral country long before the discovery of gold in California, and it was by Mexican half-breeds from the Cimarron range and Santa Fe that gold was found in the bed of Cherry creek, Colorado.

With the building of the Atchison, Topeka & Santa Fe railroad to Pueblo, and the extension of the Rio Grande railroad across the Raton pass towards Santa Fe, a new era has opened for the Territory. The vigor displayed in the rapid building of these lines has undoubtedly been due in a great measure to the sudden growth of the San Juan mines, which lie just north of the border of New Mexico. But already their influence has been felt even in the most remote camps of southwestern New Mexico.

The production of the mines of this Territory has been as yet very light. The gold and silver shipments have never exceeded \$500,000 annually, and until within the last five years no copper or lead was produced. The exports of base metal at present reach about \$300,000, and are increasing steadily, with the continued development of the Clifton and Santa Rita copper mines. Up to 1870 little or no silver hulled was produced, mining having been confined almost wholly to gold washing. With the opening of the Silver City district in Grant county, New Mexico entered the list of silver-producing districts, and has year by year since then increased her output of that metal, till now the exports of silver equal, if they do not exceed, that of gold.

The cause of the slow growth of the Territory is to be found mainly in the natural indolence of its inhabitants, of whom the great majority are half-breeds, content to do nothing except such as may be necessary to earn their daily bread. Up to the present time it has also been the most inaccessible portion of the Union, only approachable by hundreds of miles of staging over alkaline plains, and across burning, sandy deserts. Notwithstanding the Territory has advanced slowly in the development of its mines, and now, as railroads are approaching its borders, is showing many indications of a vigorous future. Prospectors are moving across the line from San Juan and exploring both slopes of the main range to the southward; inquiries are being made regarding the immense dry placers known to exist in the Rio Grande valley and its tributaries, and in the already opened mining districts a renewed activity is reported as a consequence of the prospect of railroad communications with the rest of the world.

The principal mining districts of New Mexico are the Moreno (quartz-placer) in the Cimarron range, the Pinos Altos in the southwestern corner of the Territory (gold quartz), and the Old and New Placer Mountains. Of these the first two are at present the most developed. The second includes the Santa Rita and Clifton copper mines and the lively camps of Silver City and Georgetown.

The Moreno mines have been at times developed with great vigor and energy, and have yielded excellent returns. The ores found are pyritous, decomposed at the surface, and of the class known as refractory, that is, not capable of being saved except by smelting. On that account as soon as the free surface quartz was exhausted the district languished, and cannot be expected to revive permanently until supplied with proper reduction works. Meanwhile, the placer grounds of the Cimarron and Moreno rivers are being worked with success; and will in the near future attract enough attention to draw capital to the camp, which in every way is worthy of careful examination.

Pinos Altos district, embracing the silver mines of Silver City and Georgetown, the copper mines of Clifton and Santa Rita, and the gold veins of Pinos Altos, is at present the most prosperous district in New Mexico. The silver mines are in limestone, and have yielded handsomely. The copper mines are among the finest to be found anywhere, and are producing steadily. The gold lodes as yet are under a cloud. At the surface they yielded their treasure freely as usual, but as soon as the zone of decomposition was passed and pyrites were reached the camp received a check, owing to the remoteness of its position and the large capital required for the beneficiation of its ores, from which it has not yet recovered.

The placer grounds lying at various points in the valley of the Rio Grande, and in the ranges bordering it on either side, are among the most extensive in the West. Millions of acres of upland slopes are known to be auriferous to a high degree, and before the Territory came into the possession of the United States these and the gulches adjacent were worked in rude ways by Mexicans and made to pay. The great disadvantage of the locality is the lack of water, but this trouble, surveys have shown, can be overcome.

With a railroad once across its northern line

and into the valley of Rio Grande, a new life will come to this much neglected Territory. With mines as rich as those to be found anywhere, and hundreds of miles of deep placers scarcely touched, it presents a most inviting field for exploration and unusual attractions for careful investment. It is to be hoped that the new southern road, the Atchison, Topeka & Santa Fe, will before long push its main line still farther southward, and open it to the world.

## Distilled Water for Marine Boilers.

A London mechanical engineer has been studying the action of marine boilers, and decided that they should be fed nothing but fresh or distilled water. This water he proposes to care for so carefully that it may be used over and over again, without any admixture of sea water or the products of sea water; and this was easily accomplished, as the machinery in question had been designed to avoid any leak whatever, and the amount of waste that did take place from glands, etc., was so small in quantity, that no practical inconvenience was found in providing the small supply of fresh water required to make good the waste that did occur.

The possibility of using water which did not injure the internal surface of the boiler enabled the author to design the boiler on a system that combines maximum strength and safety. The horizontal tubes of the boiler are 2½ inches internal, and 3 inches external diameter, excepting the steam-collecting tube, which is 4 inches internal and 5½ inches external diameter. The horizontal tubes are welded up at each end one-half inch thick, and connected by small vertical tubes of seven-eighths of an inch internal and 1 5-16ths inches in external diameter. The firebox is formed of tubes bent into a rectangular shape placed 1½ inches apart, and connected by numerous small vertical tubes seven-eighths of an inch internal diameter. The body of the boiler is made of a number of vertical sections, composed each of 11 tubes, connected at each end by a vertical one; these sections are connected at both ends by a vertical tube to the top ring of the firebox, and by another to the steam-collecting tube. The whole of the boiler is surrounded by a double casing of thin sheet iron, filled up with vegetable black to avoid loss of heat.

The engine has three cylinders—the first is a single-acting, high-pressure cylinder, and the second also a single-acting cylinder, four times the capacity of the first; these two cylinders are bolted together in the same straight line, and have a common piston rod. The third cylinder is double-acting, four times the capacity of the second, and its piston rod is connected to a crank at right angles to the other crank.

Having safely generated steam of high pressure at—say 350 pounds per square inch—a serious difficulty has to be overcome in using it, from the temperature affecting the lubrication of the pistons and packing of the glands. This difficulty the author has succeeded in overcoming by introducing the high-pressure steam into the upper end of the first cylinder, where there is no gland, and where the piston is formed so as to require no lubricating material. The steam is cut off at about half stroke in this cylinder, and when it is admitted for the return stroke into the bottom of the second cylinder, of four times the area, the temperature is so much reduced as to cause no difficulty when brought into contact with the piston rod gland. From the bottom of the second cylinder the steam expands into the top of the same cylinder, which is of larger capacity than the bottom, and serves as a chamber, and is in direct communication with the valve-box of the third cylinder; this last is double-acting, and is arranged to cut off at about a quarter stroke, and at the termination of the stroke exhausts into the condenser, with a total expansion of about thirty-two times. All the cylinders are jacketed with wrought-iron tubes, which are cast in the metal, and supplied with steam direct from the boiler, the condensed water from the jackets being conveyed to the bot-well. The whole of the valve-boxes, etc., are inclosed with a double case of thin sheet iron, filled in with vegetable black, to maintain all the parts at a high temperature.

The surface condenser used is constructed of a number of vertical tubes in such a manner as to be absolutely tight, so as to insure that the condensing water inside the tubes shall not mix with the water from the condensed steam outside them. The tubes are seven-eighths of an inch internal and one and five-sixteenths inches external diameter, welded up at the top end and fixed securely in a tube plate at the bottom. These tubes are fitted with internal tubes, open at both ends, which are fixed in a division plate at the bottom, in order to cause the condensing water to circulate to their extreme ends, the course of the circulating water being shown on the drawing by arrows.

A small still, worked by a steam coil, is used to distill water for replenishing any small waste that may take place in the feed supply. A duplicate apparatus forms part of the ordinary equipment of a sea-going vessel, to furnish steam from sea water for blowing the steam-whistle, cooking, supplying distilled water for use of passengers and crew, and other purposes where distilled water is required.

A stock dividend of one and one-half shares of the Governor Consolidated mining company's stock for each and every share of the Martin White company's stock has been declared by the Directors of the Martin White mining company, payable on and after June 22d, 1877.

## MECHANICAL PROGRESS.

## The Iron Industry in 1876.

Mr. James M. Swank, Secretary of the American Iron and Steel Association, has just issued his annual statistical report of the progress of the iron industry in the United States during the year 1876. The production of pig iron in the United States in 1876 was 2,093,236 tons, against 2,266,581 tons in 1875, 2,689,413 tons in 1874, 2,868,378 tons in 1873, and 2,854,558 tons in 1872. The decrease in 1876, as compared with 1875, was 173,345 tons, or about 8%. Since 1873, the greatest year of production, each year has shown a decrease as compared with the preceding year, the percentage of decrease being as follows: 1874, 6.4; 1875, 15; 1876, 8%. From 1873 to 1876 the decrease has been 775,042 tons, or 27%. This is a very great shrinkage, and indicates, with concurrent low prices, a very great depression in the pig iron industry of the country. Mr. Swank says: If the rate of decrease which marked the period from 1873 to 1876 were to be continued, the production of pig iron in the United States would entirely cease in 1884, less than eight years from the present time, and our furnace stacks would only be useful as observatories for the study of astronomy. But our pig iron industry is not destined to come to such an untimely end, for we see that the heavy percentage of decrease which had characterized the year 1875 was not continued in 1876—the decrease in the former year being 15%, and in the latter year only 8%. It seems plain, from a consideration of the relative decrease in these two years, that the mere production of pig iron commenced last year to rally from the effects of the panic of 1873, and this view is strengthened by reference to the statistics of the stocks of pig iron on hand and unsold at the close of the last three years, which will be found elsewhere in this report. At the close of 1874 these stocks amounted to 795,784 net tons; at the close of 1875 to 760,908 tons; at the close of 1876 to 674,798 tons. A decrease in stocks at the close of last year, and the arrest in 1876 of the headlong decline in production which characterized 1875, are certainly strong symptoms of an early increase in the manufacture of American pig iron. We believe that we stand even now within the shadow of this increase. From information in our possession, and from a careful survey of the whole field embraced by the iron and allied industries of the country, we feel entirely safe in predicting that the production of pig iron in 1877 will be at least as great as it was in 1876. It is for the producers to decide whether it is wise to increase production at present prices.

Twenty-three States and the Territory of Utah made pig iron in 1876. Pennsylvania made almost half of the total product, namely, 1,009,613 net tons, or 48.2%, slightly increasing its production over that of 1875, and largely increasing its percentage, which was 42.4 in that year.

## A New Electric Motor.

A Bostonian, Prof. Gary, claims to have discovered a new method of applying electric force to motive power, and gives the rationale of his arrangement. Believers in "perpetual motion" will be interested in reading the following: It is well known, not only to the scientific, but to all who have observed the ordinary phenomena of magnetism, that when a bar of soft iron is made to approach the poles of a permanent magnet it becomes magnetized, and while in that position is itself a magnet by induction, having polarity and the power of attraction and repulsion like other magnets, opposite poles attracting and like poles repelling each other. But Prof. Gary has discovered what is not generally known, that as the bar of iron is brought nearer the poles of the magnet, when very near, yet not quite in contact, its polarity changes, the positive pole becoming negative and the negative pole positive. The discovery of this law is the point on which the invention turns. By encircling the bar with a very slight current of electricity to produce an equilibrium between the magnet power of the bar and that of the permanent magnet, the polarity of this current being changed, by means of a current changer, to correspond with the change of polarity in the bar, at the instant such change takes place attraction ceases and repulsion begins, and a reverse motion is obtained.

Then by using two magnets, or sets of magnets, one to attract while the other repels, the bar of iron, which may be attached to a walking beam, pendulum, or other lever, is moved to and fro with a rapidity and regularity suited to any mechanical use, and with a power limited only by the power of the magnets applied.

In using the ordinary electro-magnetic power the current of electricity must be equal to the power of the magnet which it operates, but in this case, as compared with the available power of the permanent magnet, the power of the electric current may be less than one to 100, and it may be taken from a small galvanic cup, or it may be generated by friction of the machinery as it runs, so that the cost of producing it is next to nothing.

The engines which Prof. Gary has already constructed upon this principle are of the size for running dental machines, sewing machines, jig saws and other small machines requiring little power, but he sees no reason why they

using larger magnets, and more of them, the available power may not be increased indefinitely.

**NICKEL PLATING.**—A foreign exchange gives the following recipe: To a solution of five to 10 per cent. of chloride of zinc, as pure as possible, add sufficient sulphate of nickel to produce a strong green color, and bring to boiling in a porcelain vessel. The piece to be plated, which must be perfectly bright and free from grease, is introduced so that it touches the vessel as little as possible. Ebullition is continued from 30 to 60 minutes, water being added from time to time to replace that evaporated. During ebullition nickel is precipitated in the form of a white and brilliant coating. The boiling can be continued for hours without sensibly increasing the thickness of this coating. As soon as the object appears to be plated it is washed in water containing a little chalk in suspension, and then carefully dried. This coating may be scoured with chalk, and is very adherent. The chloride of zinc and also the sulphate of nickel used must be free from metals precipitable by iron. If during the precipitation the liquor becomes colorless, sulphate of nickel should be added. The spent liquor may be used again by exposing to the air until the contained iron is precipitated, filtering and adding the zinc and nickel salts above. Cobalt also may be deposited in the same manner.

**A NEW STEAM CRANE.**—English exchanges give accounts of a trial of a self-acting bucket and fork, with patent double-barreled crane or winch, which has just been brought out by a Hull firm. The crane is an excellent specimen of mechanical skill. It travels on rails, and the peculiarity in its construction is that it has very simple frictional gear, with two barrels and levers so arranged that one man has complete control over the bucket, either whilst hoisting or lowering, and at the same time is able to swing it round to any given place in discharging its contents. The bucket is attached to the crane by two chains, on one of which it is lowered by means of a brake. It falls wide open into the material which requires lifting, and by hoisting the second chain it is drawn down by a very simple arrangement of levers, and whilst filling, gradually closed. The bucket is then raised to any height, and by throwing the weight again on the first chain, is made to open again and discharge its contents. By this ingenious piece of mechanism a great saving is effected in time and labor. The self-acting bucket is available for lifting seed, grain, sand and gravel, mortar, coals, etc., and is especially useful in dealing with sewage and dredging small lakes and ponds.

**INCLINED PLANE RAILWAY.**—The *Iron Age* says that the Duquesne inclined plane, opposite the New Point bridge, at Pittsburgh, was opened to the public on the 17th ult., and on the 20th there were 7,000 passengers passed over it. The elevation of this plane is 400 feet, the whole length being 792 feet; the grade is 30½ degrees. The engines at the top of the hill are each 75-horse power; each car weighs 4½ tons, and is made 7 feet wide by 15 feet in length, with seats for 40 passengers, the trucks being made of rolled beams. The freight compartment of each car measures 6x6x7 feet, and is built beneath the floor of the passengers' room or compartment. The drum and wheel are each 12 feet in diameter, the drum being entirely of cast iron. The boilers (two) are each 42 inches by 24 feet. The bridge is all wrought iron, 362 feet in length, and was built by the American Bridge Company, of Chicago. The highest iron trestle is 71 feet between the masonry and the bottom chord of girders.

**MAKING MARBLE FROM SLATE.**—A new industry that is steadily growing into importance, is the turning of slabs of slate into imitation marble. The process is thus described: The slabs of slate are first surfaced by a planer, and brought to the required thickness, and patters are then laid upon the slabs, and mallet and chisel work out the desired forms and moldings. The peculiar feature in the operation, however, is the marbleizing. The material for the latter is prepared in a vat, and the slab is let down upon the composition, which adheres to the surface of the slate; the slab is next baked in an oven for one night, then coated with a varnish manufactured for this special purpose, and after six repetitions of these processes, it is finally removed and polished, the surface presenting, as is well known, a beautiful appearance; and so firmly united to the slate is this coating that it cannot be scaled or chipped off without taking the slaty particles with it.

**COTTON SEED AS BOILER FELTING.**—A Florida paper mentions a new use to which cotton seed has recently being put that is of no little import. It is in the shape of a non-conducting cover for steam boilers, and is described thus: "It is the cortical part of the seed with the little fuzz attached that is used. A layer of these cotton seed hulls is put around the boiler with the aid of slats, and then the whole is covered with a layer of plastering. With 25 pounds of steam on the surface of this casing it was barely warm; and we are assured that both in the engine and fire-rooms the temperature has been greatly reduced, so as to be much less oppressive, since the casing was put on. This seems to be something entirely new, and though in the present instance it is highly satisfactory, the party who tried it thinks he can suggest some improvement so as to render the non-conducting of heat still more perfect.

## SCIENTIFIC PROGRESS.

## Spontaneous Generation.

A few weeks ago we gave Dr. W. H. Dallinger's notes of researches into the monads and other minute organisms. Readers who have followed Tyndall through his examination of the germ theory, will be pleased to learn the results of his recent experiments. In a recent lecture in London he gave a resume of the work done in the spring of 1875-6, which went conclusively to show that in the atmospheric conditions then existing in the laboratory of the Royal Institution, five minutes' boiling was found to be sufficient to sterilize the infusions in any of the many hundred flasks and tubes experimented on, both animal and vegetable infusions being used. In the autumn of 1870 Professor Tyndall resumed his experiments with hay infusions, but found that some, instead of needing only five minutes to sterilize them, required 15 minutes. The way in which he found that not only did the hay behave differently than in the previous experiments, but that also all the tubes of other infusions experimented on in the Royal Institution showed decomposition, and how he traced all this to dry old hay in the laboratory, he described to members of the Royal Institution in January last. Led thus to examine the old hay, he has found that in some cases the bulbs charged with infusions of it were not sterilized with even four hours' continuous boiling, and in some cases germs were found so indurated that four or six, and in one case even eight hours, were not sufficient to deprive them of life. It is a question of obvious interest to the scientific surgeon whether those powerfully resistant germs are amenable to the ordinary processes of disinfection. They have been found competent to cause infusions, both animal and vegetable, to putrefy. How would they behave in the wards of an hospital? And again, how do they act in establishments for preserving meats and vegetables in tins? The shaking of a bunch of desiccated hay might make the processes of boiling quite nugatory. Professor Tyndall's later researches have made known to him that discontinuous heating for a short time will produce the death of the germs. An aggregate of four minutes in the one case will effect what four continuous hours in the other could not. A temperature, too, far below the boiling point suffices. The fully developed bacterium is killed at 140° Fab. Fixing the mind's eye upon the germ during its passage from the hard and resistant to the plastic and sensitive stage, it will appear in the highest degree probable that the plastic stage will be reached by different germs in different times. Some are more indurated than others, and require a longer immersion to soften and germinate. For all known germs there exists a period of incubation, during which they prepare themselves for immersion as the finished organisms, which have proved themselves so sensitive to heat. If during this period and well within it the infusion be boiled for even a fraction of a minute, the softened germs which are then approaching their phase of final development will be destroyed. By repeating this process every 10 or 12 hours, and before the least sensible change has occurred in the infusions, each successive heating will destroy the germs then softened and ready for destruction, until after a sufficient number of heatings the last living germ will disappear. Another means of destruction has been found to be to deprive the infusions of air. Unboiled infusions deprived of air by five or six hours' action of the Sprengel pump are reduced to permanent barrenness. Like higher organisms, the bacterial germs are poisoned by the excess and asphyxiated by the defect of oxygen.

**DEEP SEA LIFE.**—The mystery of deep sea life lies in the fact that there are multitudes of representatives of the animal world which, in virtue of their animality, are incapable of nourishing themselves upon inorganic matter, yet which are living miles below the limit at which vegetable life ceases. Some of the organisms found in deep sea soundings are undoubtedly of a vegetable nature; but these are surface-living diatoms, or other forms, which sink when they die. This animal life at the sea bottom is capable of appropriating as food the organic matter held dissolved in the ocean water, as well as the inorganic substances necessary for the formation of its skeleton and the gases required for respiration. For life at the bottom of the sea is essentially like all other animal life; it requires food to eat, air to breathe, and minerals from which to elaborate its framework. Careful experiment has solved the difficulty: the surface-living nutriment descends after death; slowly and laboriously the life-sustaining oxygen makes its way from the surface to the depths where cold and darkness reign, and as slowly the poisonous carbonic acid—the result alike of life and death—makes its way to the surface. Thus, just such life as can exist under the difficult conditions there present, does exist in enormous extent.—*Scribner.*

**A DISCOVERY.**—Principal Dawson announces the discovery of the diploxylon of Corda in the coal-measures of Nova Scotia. It is related to the sigillaria, with features approaching those of the lepidodendron, and has never before been seen in this country.

## Wonders Under Water.

M. Tosselli states that he has been making experiments with his submarine vessel, or "marine mole," as he calls it. He is struck with the correspondence of many of the phenomena to those observed in ballooning, and considers that it is at the bottom of the sea that the problem of aerial navigation will be solved. In a liquid mass which is still, the machine moves quite well in obedience to the screw propeller, which is driven by the hand. But if the vessel meets a current, it is vain to think of contending with it. Another difficulty, as in balloons, is in orientation. Once a balloon has got to some distance from the earth, it becomes impossible to tell the direction in which it is going. The needle is useless. And, similarly in the "marine mole," when it is only 0.39 of an inch under the surface, and nothing is seen in motion but the fish, the compass is found of no use. To go to a certain point, an artificial meridian has to be arranged outside. M. Tosselli remarks, too, on the great distinctness with which sounds are heard. At a depth of 110 feet the screw of a steamer, passing about 660 yards off, sounded in the (hermetically closed) mole as if directly overhead. The contrivance of M. Tosselli, affording as it does a novel opportunity of observation, may furnish some instructive data in physics.

**OBTAINING LIGHT BY BURNING QUARTZ.**—According to the *Telegraphic Journal* M. Plante has called attention in the French Academy to the bright light obtained when an electrode of one of his secondary batteries (a powerful one) is applied to a glass tube or wall of a glass vessel containing a saline solution. With the positive pole a stronger force is required; but the light is more silent than with the negative, which produces some crackling. When the light appears an abundant white vapor is given off, having a slight alkaline reaction. The glass is strongly attacked and devitrified. It might be thought that the brightness was due to lime combined in the silicon; but in the spectrum there are no appreciable lines, except some traces of that of sodium; whereas a piece of lime spar, under the same conditions, gives distinctly the lines of calcium along with a continuous spectrum. The lines of silicon do not appear, being weak, and the spectrum being intensely luminous, just as the carbon lines are not perceptible in the spectrum from the voltaic arc. The silicic origin of the light is further proved by the fact that it is obtained likewise on contact of the electrode with pure silicon in the state of crystals of hyaline quartz. M. Plante proposes to distinguish this kind of light as the *electro-silicic light*.

**GEOLOGICAL.**—An interesting point of structural geology, elaborated by Wing (according to Prof. Dana, in *American Journal of Science*), relates to the overlapping of newer by old formations near Lake Champlain. Grandview (Snake) mountain consists of Potsdam sandstone, resting upon the western edge of an inverted syncline, consisting of the Chazy, Trenton and Lorraine shales. The sandstone covers the other beds unevenly, the western edge resting first, at the north end, upon the shales, then upon the Trenton, the Chazy, and lastly, in the southeast part of Bridport, lying upon and falling from the calciferous sand rock. This overlap and fault is part of a very extensive dislocation, said by the late Sir W. E. Logan to extend from Quebec to Alabama. The order of the rocks adjacent is not commonly the same with that studied by Wing.

**NEW SPECTROSCOPE.**—Mr. Christie has recently devised a new form of spectroscope, which, if the accounts given of it are to be depended upon, is really wonderful in its performance. The prisms employed are compound prisms of dense flint glass, combined with crown, put together in something the same way as the glass and bisulphide of carbon in the well-known Eaton direct-vision prism. It is said that an instrument of the new form, with two of the so-called "half-prisms," gives a diversive power equal to that of 20 ordinary prisms, while the loss of light is vastly less. The theory of the instrument has been a good deal discussed, and some doubts are expressed as to its defining power, which can only be settled by a record of actual performance.

**TOUGHENED GLASS IN THE GERMAN ARMY.**—The German army is to have the benefit of the newest thing out in the way of glass. Their old water bottles have been confiscated, and a new pattern has been expressly constructed in glass toughened by the De la Bastie process. The new flasks may be flung on the ground and do not break, are not damaged by the ordinary casualties of concussion, and do not crack if filled with hot fluids. The stoppers (stated to have been invented for the purpose by the manufacturer, Pritzner, of Berlin,) are those known as pneumatic stoppers, a lever pressing a disc of india rubber into contact with the sides of the neck. The flask is opened or closed by pressure on the lever on being raised or lowered.

**TENIA.**—Dr. Leidy, of Philadelphia, at a recent meeting of the Academy of Science, exhibited a specimen of tape-worm said to have been taken from the inside of a large cucumber. This was the first time he had heard of one of these worms having been found in a vegetable. The specimen has all the characteristics of a tape-worm, but belongs apparently to an unknown species.

NEW MINING ENTERPRISE.—A new mining enterprise of considerable magnitude and importance, says the *Calaveras Chronicle*, has recently been instituted in this vicinity and is being energetically prosecuted. Mr. C. J. Garland, a gentleman largely connected with the mining interests of the county, has purchased the old Kitzridge & Carpenter gravel mine in Chile gulch, and is erecting a 10-stamp battery for the purpose of crushing the dirt. The gravel is a kind of cement, agglutinating so closely that it cannot be washed by the ordinary process. The claim was extensively worked in former years and paid richly. It is thought that with the aid of a battery the cement, which could not be washed without crushing, can be made to pay, and Mr. Garland has engaged in the enterprise with the determination of seeing it through to success. Work upon the mill has already been commenced, the erection of the machinery being under the supervision of Mr. John Rider, an experienced and skillful millwright. The battery is to be run by water power, the ditch passing along close to the ground and enough above it to admit of obtaining a pressure of 260 feet. The mill will be in readiness as soon as a large force of hands can complete it, and we have every reason for believing that Mr. Garland's energy and enterprise will be well rewarded when active operations are commenced. He deserves success, and it won't be his fault if he doesn't win it.

The Oregon Steamship Co. has agreed to carry on its iron steamship, now being built at Chester, Pa., by John Roach & Son, upon her completion, on or about the 15th day of January, 1878, steamer passengers from New York to Portland direct, via the Straits of Magellan, at the extremely low rate of \$75, currency, board included.

## The Mining Share Market.

Transactions in mining shares have been very limited this week, as the San Francisco Board adjourned over from Saturday until Thursday morning, so that there were no sales on Monday, Tuesday, or Wednesday. What business there has been done has been without special interest, and fluctuations slight. The Nevada Board has resumed operations again after a cessation of two months. In the present state of the market there seems hardly business enough for three Boards. News from the mines continues favorable, and the situation on the Comstock is thus summarized by the <

# MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

### ALPINE.

**ADVANCE.**—*Alpine Chronicle*, June 29: This mine continues to look well. They are now running along the foot-wall, and taking out fine ore. The large new boiler will probably be at work to-day. The mill is doing good work, but the furnace is too limited a capacity, and the company will probably erect a new and much larger one as early as possible. The entire works of the company are always open for inspection.

**STREVSING.**—This mine is in about 200 feet, and it is thought that 15 or 20 feet further will bring it to the ledge. Its owners have worked faithfully this spring and deserve success.

### AMADOR.

**WILDMAN.**—*Amador Ledger*, June 30: Mr. Conise is in Sutter Creek getting things in shape to start up the Wildman. An incorporated company has been formed with 65,000 shares.

**OLIVE.**—Work has been suspended for the present. A clean-up was made on Saturday last, the result of which was not sufficiently encouraging to justify the continued prosecution of work.

**CROW'S POINT.**—We are happy to report a decided improvement in this mine. The last crushing came up to the paying standard.

**MAHONEY.**—The contest between the two factions of stockholders for the possession of this mine was decided by Judge Wheeler last week, in favor of the Stewart party. The late board of Trustees were declared illegally elected, and all their acts null and void. After a long and tedious session on the part of the ousted officials, the victorious party took possession of the books and other documents belonging to the company. The defeated faction gave notice of appeal, and asked for a stay of proceedings pending the decision of the higher court, which Judge Wheeler refused to grant.

**GRAND MINE.**—The dawn of more prosperous days has reached the Old Mine. The rich rock has been struck in the north drift of the 1000-ft level—richer, it is said, than any met with in the past history of the mine. The high grade ore is extensive, and the discovery comes just at an opportune moment, when an assessment is hanging over the stockholders.

**ORIGINAL AMADOR.**—From all that we could gather while in Amador city the other day, this mine has shown a decided improvement lately.

**MEEKS CLAIM.**—Some time ago we mentioned that a mining claim adjoining the Coney on the south was sold to W. A. Nevilles. A shaft has been sunk upon the property, and a fair-sized vein of paying ore discovered. A dispute has now arisen concerning the ownership.

**V. FURBER.**—The V. Furber of the Amador Lumber Company, for floating mining timber from the reservoir to Sutter Creek, is now receiving the finishing touches. One more week will see everything completed, ready for the reception of water. With the single exception of the raised flume of the canal company at New York ranch, it is the longest and costliest work of the kind to be seen either in Amador or neighboring counties. It measures a little over a mile in length, and required more than 100,000 feet of lumber in its construction.

**THE VOLCANO TUNNEL.**—*Amador Dispatch*, June 30: The great tunnel under the Volcano basin, we learn, is now in about 630 feet, or about one-third of the distance that they will have to run before striking the main gravel bed. The rock where they are now working is said to be very hard, and the progress is necessarily rather slow.

### CALAVERAS.

**CLEAN-UP.**—A clean-up was made in Veith's mammoth hydraulic tunnel ridge, this week, and the mine has been shut down on account of the failure of the water. We learn the clean-up amounted to \$5,000, which for a run of less than two months is a very handsome yield. Piping cannot be resumed until the fall rains set in.

**AND NOW EMERSON.**—Emerson, proprietor of the Happy Valley hydraulic, is cleaning up, but hasn't got through yet. The first instalment of the "product" of his mine came in town Thursday night. We didn't ask Emerson how much he had, but judging from appearances it couldn't have been less than \$6,000. And there's more coming.

**GWIS.**—Everything continues to progress most favorably at the Gwin mine. Splendid rock is being obtained, and there is every prospect of \$500,000 of it—this is the one now being worked—will prove the most remunerative of any since the mine was opened. The rock is of a higher grade than any previously mined, the ledge is wide and there is nothing to indicate a shortening of the pay shaft. The batteries are kept employed and work is actively progressing in every department of the mine.

**ROCK.**—We have the following returns from six crushings of rock at the Gwin mine: 1300 lbs. of ore from the Potter & Rodgers mine paid an average of \$30—taking the first and second grade ores together. Eighty tons from Gass & Co.'s mine yielded \$13 per ton. The rock was unassorted and the entire ledge—a wide one by the way—was taken out. The Gass mine is looking splendidly and really promises to be a valuable piece of property.

**FROM THE UPPER COUNTRY.**—We continue to hear favorable intelligence from the upper mining districts. At West Point Fields & Co. lately discovered a new ledge on Skull flat and have sunk a shaft 60 feet in depth upon it. The lead is two feet wide and pays an average of \$35 per ton. We have been shown a very rich specimen of quartz taken from the Hall & Lassey mine near West Point. The quartz is remarkably fine, and the ore is rich in sulphur. The tunnel is now in a distance of about 300 feet, uncovering a ledge two feet wide, half of which is composed of the same character of rock as that shown us. At the Champion sinking and stoping are being vigorously prosecuted with uniformly good results. A new tunnel has been run in the old Zacatero mine and the ledge cut. The quartz is splendidly. The new Zacatero mill is just receiving the finishing touches and will be in operation shortly. It is being supplied with all the modern gold-saving appliances. The shaft of the Enterprise Con. Co.'s mine has reached the depth of 100 feet. A sample lot of rock yielded an average of \$22 per ton. We understand that a San Francisco company is negotiating for the purchase of the Granite mine at West Point. At Railroad Creek the rock is about 100 feet on each. The Hemlock is now down 700 and the Wyoming 650 feet, and Mr. Davey and several other parties, who came from there a day or two ago, say that both mines are looking well, and the prospects for striking good ore during the progress of sinking are excellent. Davey & Co. commence the work to-day with 14 men and will push down as fast as possible.

### INYO.

**EMIGRANT MINES.**—*Coso Mining News*, June 30: Peter Taylor, Superintendent of the Emigrant company's mines, Lee district, has returned from San Francisco with instructions to re-commence active operations at the mill and mines at once. Accordingly men were set to work upon the mines, teams to hauling and men at the mill. Mr. Taylor has secured the services of Mr. Horatio Smith, whose long experience in Arizona and California has made for him a most excellent reputation as a practical millman and amalgamator. Mr. Smith has already gone to work; the developments in the Cactus and Valentine mines are excellent, and we expect to report in a week or two a valuable shipment of fine bullion.

**PANAMINT.**—Richard Davey & Co. have taken the contract to sink upon the Wyoming and Hemlock mines of the S. V. M. & W. Co., at Panamint, to a depth of 100 feet on each. The Hemlock is now down 700 and the Wyoming 650 feet, and Mr. Davey and several other parties, who came from there a day or two ago, say that both mines are looking well, and the prospects for striking good ore during the progress of sinking are excellent. Davey & Co. commence the work to-day with 14 men and will push down as fast as possible.

**MINING STRIKE.**—*Inyo Independent*, June 30: After almost two years of steady work and an expense of more than \$5,000, Chris. Crohn, of Cerro Gordo, has lately been rewarded by a valuable strike of rich ore. In the Enterprise, a mine situated in the San Lucas canyon, about three-fourths of a mile from the Belshaw furnace. The ledge carries galena and silver ore, and with a small force he is taking out about one ton per day, which pays \$15 per ton after deducting all expenses of mining, packing and reduction.

**REX MOUNTAIN BULLION.**—For the present season the little 5-stamp battery run by the Rex Mount Co. has produced 12,333 ounces of gold and silver bullion, which does not include a shipment of 4,800 ounces more to be made to-day. It will be remembered that the mill started but a few weeks ago, and from the foregoing statement of facts it is not content in the final verification of our prediction that the Rex Mounts will make for this season the best shipments of any quartz mill of equal size on the coast. It is an old rattletrap concern erected in the days of Lang Syne by the Silver Spirit Co., reconstructed for present uses. In the course of operations this week the mill power has been reduced by breakage to three old-style steam engines as the only means of producing bullion, but Boss Flint said that the new oil mill will not stop if he gets down to one. However, the pans are to be repaired and replaced soon, when the regular bullion shipments will be increased in number and value.

**THE YONACIO.**—The operations of W. A. Greenley upon the San Yonacio mine in Lower Cerro Gordo have resulted in the opening up of what is undoubtedly the main and most solid ledge which forms the basis of the immense mass of ore that has been struck in the mine. The ledge is now being extracted from it. The ledge is opened in the bottom of the old works stands nearly perpendicular; has been opened laterally for 30 feet, and shows an ore vein of 18 inches in width. The chlorido and native silver specimens shown will assay among the thousands.

**ELCISE.**—The mill is closed down for the present, pending the return of Supt. Nelson from San Francisco, who is expected every day. We believe that work is still progressing at the mine in sinking the bottom of the shaft, presenting a better ledge and a finer quality of ore than any other portion of the mine.

### NEVADA.

**THE RICH STRIKE.**—*Grass Valley Union*, June 28: A few days ago we made mention that Kece, Grant and two others had made a rich "find" of quartz, on the headwaters of Squid Creek, near this place. The find is the richest in gold that we have ever heard of. They have a ledge nearly five inches thick, which is filled with gold. There is as much, and sometimes more, of bulk of gold than of quartz, and of course the gold is much greater than the quartz when it comes to weight. Yesterday the owners of this remarkable bonanza shipped four bars of gold to the Swiss American bank in San Francisco, aggregating \$10,000 in value. That gold was taken out by hand process, in three days. That is really a ledge of gold which carries some quartz—incredible as such an assertion may seem. It is owned by a first-rate set of men.

**MACHINERY PURCHASES.**—Col. Berry, manager of the old Sogge mine, near Nevada City, has purchased the machinery of the Union mine and has immediately started it. In a few weeks he will be at work more vigorously than ever, taking out the pay stuff. The old Sogge is a good mine, and will be better now that it is to have better machinery.

**YUBA RIVER.**—*Foothill Tidings*, June 30: At 120 feet in the drift a raise was made in this river mine early this week, to reach the ledge and river reached. Eighteen feet found tailings but not the river bed. The ledge is now going on, and some more of the working fund stock will be sold to defray expenses. The "raise" has demonstrated the entire feasibility of this plan of river mining, and the few shares needed to raise money for carrying it through should find ready sale.

**HOMERIDGE BUNKER.**—Work has commenced in good earnest at this mine. Contractors are sinking the shaft, making good headway. The ledge in the shaft is large and well defined, showing finely in free gold and sulphurets. The machinery works like a top; the new buildings are nearly completed, and the Homeridge has every prospect of a fine mine.

### PLACER.

**A WOMAN STRIKES A MINER.**—*Placer Herald*, June 30: We understand that Mrs. Bissett, an elderly lady residing on Rock creek, who occasionally prospected around among the hills, made a strike last week and took out, up to last Saturday night, between \$400 to \$800. The deposit in all these respects resembles the formation in Bell's bonanza mine, and it is more than likely she will realize a very handsome stake out of this strike.

**MOLIN** is down on his ledge about 40 feet, and though rich from the surface, finds better rock in the bottom than he has yet taken out. He is troubled very much with water, owing to his inadequate means of hoisting. A remedy of this temporary trouble will put him in a way to realize his ledge.

**GRAVEL.**—*Dutch Flat Florist*, June 29: The Elmore Hill, Star and Union, and Baker claims continue washing. The Southern Cross and Polar Star claims are off, pending the preparation and explosion of a powder blast in each. The former exploded 480 kegs of powder yesterday, and the latter will explode 420 to-day, making a total in the two claims of 900 kegs.

**THE FRANKLIN** has been giving its main tunnel ahead, and is now raising an incline to the surface. The Superintendent intends to wash about four days longer and then clean up for the season.

### PLUMAS.

**GRANITE BASIN QUARTZ.**—*Plumas National*, June 30: Mr. F. Hill, of Meadow Valley, gave us a specimen from the ledge recently found by J. B. Bachelder in the Granite Basin country. The rock is certainly the richest we have seen lately, free gold being visible all over it. The vein is narrow, but it is holds ore, and the ledge is a valuable one. The rock now being taken out, and which will soon be crushed in the old Hallstead quartz mill, will probably pay from \$50 to \$100 per ton. Mr. Hill thinks the Buck's Ranch country, generally, is full of gold-bearing quartz lodes, and if thoroughly prospected, a quartz district will be opened second to none in the country.

**SPANISH CREEK.**—Our correspondent says: "The Blackhawk boys are doing splendidly in their claims. This last week they took out one piece weighing \$33, and a good many smaller ones. Cashman is now running a tunnel in Michigan hill, and it pays well. If he had a pipe-head of water he would make more money than any man around this section, and as it is, he has a claim that will pay well and prosperously worked. A China company has located a new claim in the bed of the river, and report says that they are making money. The Maxwell company are reported to be doing splendidly in their new mine. Their pipes are running day and night. Nash has a quartz mine that promises well."

## Nevada.

### CORNUCOPIA DISTRICT.

**NEW STRIKES.**—*Cor. Silver Star*, June 30: The new strikes made lately just north of town are developing splendidly. If they turn out as well as expected they will be a great help to this place. One the Runa, located by Phil Sullivan and Wash Northop, who have sunk a shaft on it about 20 feet, which shows the ledge to be four feet strong, with ore that assays from \$150 to \$500 per ton. They are still sinking and intend to ascertain whether they have a permanent mine or not. The other claim adjoining on the same ledge was located by Steve Turner, John Owens and John Pritchett. It lies about as well as the first mentioned, everything else is the same, and we think this camp could bear prosperity a little while at least.

### ELY DISTRICT.

**RAYMOND & ELY.**—*Pioche Record*, June 30: Everything is looking encouraging in this mine. Are extracting

much more than usual. The work of drifting both east and west on the new strike on the lower level is being pushed on rapidly, success attending the work and getting a fine amount of good ore. The mill is running 15 stamps and half of the pans on ore, the other pans and settlers being used on tailings. Battery samples of ore from the upper levels now being worked at the mill average \$120 per ton. At the concentration works of Hugh White, on tailings of the Raymond & Ely, the new pump has been placed in order and has been working successfully for the past several days. The water that is wanted, the work of concentrating being successfully in consequence. Concentrations are being shipped every day.

**PIOCHE BULLION.**—Wells, Fargo & Co. shipped bullion from Pioche during the past week valued at \$19,484.

**MILL LEASING.**—On Wednesday last Superintendent Blair informed us that the Trustees of the Alps company had succeeded in procuring the American Flag mill at Bullville, and that it would immediately be placed in repair and started to work by Monday if possible. The shipment of ore commences immediately and continues right along, so as to keep the mill steadily running. The intention of the Superintendent is to start the mill as above stated, and to make repairs constantly until it is in thorough order. The company has plenty of ore, and of a good quality, to run the mill, and they intend giving a good amount of the week's pay long.

**ALPS MINE.**—Notwithstanding the disaster to the Concord mill the work on the mines has been prosecuted vigorously during the week. Retrimbering some of the stopes is going on, some of which they have not been able to touch yet for lack of time, still from those that have been fixed they are enabled to extract 20 tons of ore daily, which will be increased when the stopes are fixed. The shipments of ore commenced to the American Flag mill (15 stamps), last Thursday, having sent 65 tons that day and 65 tons yesterday, leaving 70 tons on the dump. Shipments will continue, so as to have the mill kept running regularly. The body of ore in the mine is looking well.

### OSCEOLA DISTRICT.

**WATER.**—*Pioche Record*, June 30: We learn from Osceola that all disputes about placer claims have been settled amicably and that no further trouble is anticipated, as all claims are located and worked. Some claims have the dirt jerked from them to water and others have the water jerked from them to dirt. The water from the lake on Jeff Davis peak has been abandoned, as the expense would be enormous, and there being no source of supply for the lake there is no telling how long the water would last after being brought down the mountain. The five-stamp mill is about ready to work and will probably start up to-day, the 30th inst.

### PEAVINE DISTRICT.

**RENT.**—*Reno Journal*, July 1: From Peavine we have good reports. In the south drift on the Con. Poo a large body of fine black ore has been uncovered. It assays nearly \$200. The outlook is very flattering, and our predictions that Peavine is one of the richest mineral sections of the State will soon be verified.

### PYRAMID DISTRICT.

**BODY OF ORE.**—*Reno Journal*, July 1: At Pyramid the Buckeye has struck a magnificent body of ore, which so closely resembles Con. Virginia rock that an expert alone could tell the difference. It was found on Friday in the drift, in a distance of 20 feet from the bottom of the shaft, which is down some 135 feet, and makes the ore body about 250 feet below the surface. Yesterday morning the ledge had been cut for seven feet, and it is the opinion of Palmer, the Superintendent, that the ledge will be over 40 feet wide, and that before he gets through it rock will be taken out that will assay over \$1,000 to the ton. Several boxes of the ore were brought in yesterday, and the strike was made on Friday. The mine is about a mile from town. Assays were made of \$80. The Jones and Rinkind mine is also showing well. The west wall has been reached, but the other is not in sight. The ledge is, so far, 45 feet wide. Mr. Jones, the Superintendent, has quit cross-cutting and gone to sinking on the ledge, and will open out the 200-ft level as soon as possible. The rock we referred to yesterday, assaying \$600, comes from the China claim and is found right upon the surface, the ledge cropping out as high as a house. Bob Ash got returns from Wiegand yesterday from another piece. His certificate shows \$470.20.

### TUSCARORA DISTRICT.

**DE FREES.**—*Virginia Enterprise*, June 30: Reports from the De Frees mine, Tuscarora district, are of the most encouraging character. It joins the famous Grand Prize, and is being managed most successfully and economically. The four-stamp mill of the company is running on ore from the mine, the assays from which average \$132 in silver. Two hundred tons of ore are also being shipped to the Leonard mill at Cornudas. A prominent millwright from San Francisco is on the ground for the purpose of selecting a site for the immediate erection of a 10-stamp mill, which will be so constructed that 10 additional stamps can be added at any time without much extra expense. The new hoisting machinery is en route. With it more rapid progress can be made and greater depth attained than with what is now used.

## Arizona.

**McCRACKIN.**—*Arizona Enterprise*, June 23: The McCrackin Co.'s mill at Greenwood is running steadily. On account of some trouble with the battery, not more than an average of seven stamps were run during the month of May, and the mill yield during the month was 15,000. The mine has over 14,000 tons of ore on the dumps and broken down in the mine. This ore yields an average of \$55 to the ton. The grading for the new 20-stamp mill will commence on or about the 1st of July, and when this mill is completed the company expect to work an average of 80 tons daily, in the two mills. Two new pans are to be put up at the mill. A new assayer has been secured, and a large quantity of tailings will be worked. The Signal M. Co., who own the San Francisco location on the McCrackin ground, have completed grading for the ten-stamp mill, which is to be put up on the Sandy, about half a mile below Fisher's Springs and about three and a half miles from Greenwood. A town has been started there, called Nashville. Mr. William Allen has the contract for building it to some place convenient to the Signal company. He is interested in both companies. The mills are to be built under the supervision of Mr. Patton, who is an experienced millwright and built the mill for the Consolidated Virginia, on the Comstock.

**BRADSHAW BASIN.**—The Luke Co.'s mill is nearing completion. The company have employed, including mechanics, miners, laborers, etc., 15 men. There are 15 men working on the Gretna mine and there are 300 tons of ore on the dump that will work from \$75 to \$100 per ton. The ore assays from \$31 to \$366 per ton, and the ledge shows a three and a half foot vein of milling ore. The 15 men average ten tons per day.

**AZTEAN MINE.**—*Arizona Miner*, June 22: Although the Peck company have talked about taking the Aztean mill down and moving it to some place convenient to the Peck mine, no definite arrangements have as yet been made to that end. It is highly probable that the mill will still be kept, for a time at least, where it now is.

**LUCKY ORE.**—The mines in Mohave county still continue to look up, and we have the information that the Hackberry mine is producing largely of ore, and by the middle of August will be up to the 500 to 2,000 tons of first-class ore. The ten-stamp mill will then be erected and running.

**BULLION.**—*Yuma Sentinel*, June 23: The El Dorado Canyon folks took \$17,000 worth of bullion from their nine-stamp mill last month, and their mine is getting better. Their great difficulty lies in getting fuel for making steam. They have already employed collectors to get wood that comes down the Colorado from the Rocky Mountain region, and which is intercepted opposite their mill.

## Colorado.

**VIRION TUNNEL.**—*Colorado Miner*, June 23: This is a prospecting enterprise on Leavenworth mountain. It is

located between the Robinson and Broadway tunnels, and cuts the mineral veins of that locality nearly at right angles and about 80 feet deeper than the Broadway tunnel. The mine is in a direction 20° west of north, and is now about 300 feet long. Five lodes have already been passed.

**THE WHITE LODE.**—The cross tunnel which has been run for the past six months "riven into the Republican for the purpose of cutting the White, is now nearly completed, and we may expect any day to hear of another big body of ore exposed. The vein will be cut at a depth of 300 feet below the surface of the discovery. The ore is good and the vein frequently large.

**GRX, GILBERT** is laying the foundation for his engine and hoisting apparatus at what is intended to be the main opening on the Free America. It is located 150 feet west of the discovery shaft. Miners are at work sinking at that point, and raising from the west workings, in the discovery, in order to connect the two as soon as possible. A new ore-house is being erected at the Boulder Nest mine. The fast mill run from this mine gave a result of 278 ozs. silver per ton.

**SILVER ORE TUNNEL.**—A good lode, carrying a fair-sized vein of ore, has been met with in this tunnel.

**CASHER.**—The huge rock which a few weeks ago slid from its position on Sherman mountain, smashing the Casher shaft-house and covering the mine, has been broken into smaller fragments.

**MARTIN.**—Good ore has been found in the Martin lode on Leavenworth mountain. A test made last week gave a result of over 1,000 ounces.

**TERIBLE.**—Work is being pushed on and everything got in order for work on a large scale. New Trail tracks have been laid in the tunnel, and the ore-house, shops and offices at the mine have been fitted up. The water coming down from the creek has given some trouble, getting into the mine and drowning out the lower portion.

**THE Union Tunnel** is being worked by nine men, and is rapidly approaching the Terrible lode, to intersect which vein it is being driven.

**MAMMOTH.**—About the middle of last month work was resumed under the management of Messrs. Teal, Foster & Co. The tunnel and Brown gulch intended to intersect this vein, and on Friday, June 22, the tunnel was driven about 20 feet, the south wall of the lode was cut into; since then the tunnel has been driven through the lode, and revealed a large body of ore varying from 9 to 18 inches in thickness. The ore in appearance is very like that produced from the large lode being worked in the East Tunnel; it is of low silver contents, but rich in lead.

**EARL TERIBLE.**—Work on this property has been steadily pushed along. During the past month there have been about 19 men employed, drifting, sinking and stoping, and the produce of the mine has been about 15 tons of ore.

## Idaho.

**ENCOURAGING.**—*Owyhee Avalanche*, June 30: The most encouraging event connected with the progress of mining operations in this vicinity that we have been called upon to record for many long months is the action of the Golden Chariot mining company in taking steps to sink their shaft a distance of 200 feet below the 13th level. At the Potomac there are about 30 tons of rich rock on the dump awaiting crushing. Work is being prosecuted at the mine under very favorable auspices. Along a distance of 600 feet on the ledge operations have been attended with the most promising developments.

**OPERATIONS** are still in favorable progress at the Empire, and the mine is looking better than ever. There is a large quantity of rich rock ready for crushing, and bullion shipments will soon be heavy.

We have favorable reports from many small mines in this immediate vicinity, and some freshly located claims, the prospects in some of which are unusually good. Some rich placer claims have been located by J. Brown and others at Sucker creek, about 20 miles from town.

## Montana.

**PHILLIPSBURG.**—*Butte Miner*, June 19: Everything is in statu quo here as yet. How much longer this state of affairs will exist it is indeed impossible to conjecture. What the Northwestern company will conclude upon, who shall or can say? Will the mill be put to work or not? Will the company crush or buy ore of the miners, or will they content themselves with treating their own rock? When Mr. I. Lewis was over here on business for the Northwestern company, he employed some six or eight men at the mine for the purpose of connecting (by drift) what is known as the No. 2 shaft with the incline. This work is being done for the purpose of facilitating the hoisting of ore, as there is a whim on the shaft. Rumor states that the present Superintendent of the Hope company will be clothed with full power on or about the 1st of the coming month. Work is going on at the Algonquin, Salmon and Shawtown lodes. Some representation is also being done by various parties in different sections of the camp.

**MONROE MINE.**—From Mr. Logan, Superintendent of the Monroe silver mining company's mill and mines in Vi pond district, we learn that it is the intention to again start the mill the latter part of the week, or the first of next. The mill itself is in good condition, and ready to run, but the employment of the ore is not yet made up from the mine to the mill has been in such an immense shape for the past two months that it was impossible to haul any quartz. During this delay a large building has been erected, in which to store ore, above the mill and having shutes leading to the battery floor. This will be kept well supplied with ore in the future, and obviate the necessity of stopping the mill when the ore becomes impossible for a few days. The company are employing about 15 men in their mines now, and are taking out considerable ore, which will be put through when the mill starts. It is the intention, however, to do some custom milling after everything is brought down to a certain basis.

## New Mexico.

**NEW DISTRICT.**—*New Mexican Herald*, June 16: Dooney district is in the Mogollon mountains, Grant Co. Distance from Silver City by wagon road, 65 miles north; 25 of which wants working. \$500 will do the work. From the mines to the "Frisco" river, six miles, road required can be built for \$200. At that point there is a good water power—sufficient to run 500 stamps. Wood abundant for lumber and fuel at mines and mill. The leads are extensive. The first lode, ready located, the Copper Queen, Copper King, Silver Twig and War Cloud have been traced a distance of ten miles. They are in granite and porphyry and in that distance are crossed by five perennial streams. Deep creek at lowest stage runs 250 inches; Copper creek, lowest stage, 30 inches; Mineral creek, same stage, 400 inches; Silver creek, 25 inches; White Water, 700 inches. These streams empty into an empty canyon at the "Frisco." In this vicinity there is the greatest abundance of grass.

## Oregon.

**AUBURN.**—*Cor. Bedrock Democrat*, June 27: Gold was discovered in Griffin gulch on the 23d day of October, 1851; the mines in Blue canyon and other gulches in the vicinity were found in the following spring. This attracted a large immigration, and in the fall of 1862 Auburn was the second city in the State in point of popula-

## Mining in Sierra County.

A correspondent of the San Juan Times, writing from Downville, Sierra Co., says: Dull as have been the past years in the history of our town and county, a few brave souls have clung to its fortunes most tenaciously, firm in the cherished belief "the darkest hour precedes the dawn," and that a new golden era was in store for old Sierra, which, next to Nevada, now promises to become the second banner mining county of the State.

The river claims are yielding rich returns this year, and others are doing proportionately as well. The celebrated boring apparatus at Galloway's hill, five miles southeast of Downville, is now in fine working order on Bald Mountain Extension ground, and, at last accounts, was down about 60 feet. A hard boulder was struck a day or so ago, but was drilled through most beautifully, and now, with uninterrupted progress, the Pliocene Co. are slowly but steadily piercing the bowels of the earth in search of the extension of the rich ancient river bed, now enriching the lucky owners of shares in the far famed Bald Mountain at Forest City, the resurrection of whose fallen fortunes, from an almost deserted village to a miniature Virginia City, is about as wonderful as the most bewildering Arabian tales. The mountains, for miles and miles, are swarming with prospectors, on the lookout for chances to locate claims; and judging by the rapid rate in which the ground is being taken up, there will be precious little left for the "last man," who ever begins so conspicuously in the history of the times. If, as is confidently hoped, rich ground is found by the Pliocene Co., a fresh impetus will be given to prospecting in all directions, only equalled or excelled by the days of '49.

The Pliocene company is composed of leading San Francisco capitalists, who have come here with the determination to work shoulder to shoulder with us in developing the mineral resources of Sierra. They have bonded some over half of Bald Mountain Extension ground, on 18 months' time, in the sum of \$45,000, and are now busy in good earnest, having already started a small village near where it is supposed they will have to sink their shaft. If gravel is not struck on first trial by the boring machine, their motto will be "try, try again," till it is, or the fact thoroughly demonstrated that all our fairy castles have been built in vain; that the theory of the existence of a rich lead thereabouts is but a delusion and a snare. May their laudable efforts be rewarded with the success that perseverance and energy ever deserve, is the sincere prayer of every well-wisher of our county's prosperity. Mr. Thurston, Superintendent of the Pliocene company, and one of the gentlemen deeply interested in this mining scheme, is well qualified for the arduous task before him, and by his courteous demeanor and unassuming ways during his brief sojourn in our midst, has already justly won the esteem and friendship of all who have been honored with his acquaintance. If rich diggings are developed at Galloway's hill, and most every evidence points strongly now that way, a road will be built to Downville from the new gold center, which will materially assist in resurrecting our county from its present state of despondence and stagnation.

**A NEW RAILWAY SIGNAL.**—Another invention pertaining to electricity, quite as wonderful as the telephone, though, perhaps, less calculated to attract public notice, has recently been secured by patent in the United States to a Swedish inventor. The apparatus is an automatic railway signal, which enables the station officials to know the precise position of any train at any time. It gives sound signals to the engineer, and at the station before the train enters, thus enabling switches to be cleared and arranged in time to prevent accident. If two trains approach each other, whether running in the same or opposite directions, the engineers of both the trains receive signals in time to prevent collision, and the station people are at the same time automatically informed of the position of both trains. Any train may, by stopping at certain points of the road where "contacts" are arranged, open telegraphic communication with the station at both ends of the route, and two trains may in the same manner telegraph to each other. A complete record is automatically kept at each station of the speed of each train, and of the exact time it enters or leaves the station. Stop signals may be sent at any time from the stations to any train while moving. The apparatus may be arranged to send stop or danger signals to trains approaching swinging bridges which are not properly locked and fastened.

**NEW DIGGINGS.**—A letter dated Telegraph creek, Cassiar, June 5th, says: Some parties have arrived from Lake Town and report the excitement intense at these mines, owing to the discovery of two new creeks said to be about 40 miles west of McDame and Snow creeks, which are paying three companies from \$32 to \$40 per day to the hand. A miner by the name of Stevenson and "Kelly the Rake," are the discoverers. A nugget of \$500 is reported.

**THE MOLDERS' Union**, of Troy, New York, one of the strongest in the country, has resolved to allow members to work in any shop on any terms, which is a virtual dissolution of the Union. This action ends a strike of eight months' duration.

## THE ENGINEER.

## A New Transandine Railway.

A revival seems to be approaching the South American railway building industry. We notice that our English exchanges are writing articles on the enterprise and industry of Harry Meiggs, and he may be an object of renewed interest to English capitalists. More than this, we read of a new road across the Andes, which will complete the connection between Valparaiso and Buenos Ayres. The section between Santa Rosa de los Andes, the present terminus of the Valparaiso railway, and the town of Mendoza, at the other side of the Andes, comprises the most difficult part of the road. Starting at Santa Rosa, situated at the entrance of the Uspallata pass, on the Chilean side, at 2,704 feet above the level of the sea, the line follows the course of the river Aconcagua for a distance of 33 miles, until it reaches the foot of the pass at 7,315 feet above the level of the sea. In this point where the Aconcagua river receives the Juncal the line follows the course of this river, turning to the south, and after 11½ miles turns again to the east until reaching the western portal of the large tunnel at the summit, situated at a height of 11,484 feet. The difference between Juncal and the mouth of the tunnel is 21½ miles, a grade of 3½ per cent. The length of the tunnel is estimated to be 10,665 feet. The top of the mountain is 3,260 feet higher. Crossing the tunnel the line descends to the Cueros valley, with a grade of 3 per cent. for eight miles to the bridge over the river Cueros. The altitude of Cueros valley is 10,257 feet. From this point to Puente del Inca, a distance of 12 miles, the grade is 2½ per cent., and continues softening till it reaches the town of Mendoza, 102 miles from Puente del Inca, and 2,500 feet above the level of the sea.

An Italian engineer, Mr. Olivieri, has recently made a new survey of this route, comprising only the mountain region between Juncal and the Cueros river, and has proposed to shorten the line 44 kilometers, avoiding all the difficult part, and thus reducing the cost of construction considerably. His plan is to start at Juncal river, 2,240 meters high, with an inclined plane, as invented by the celebrated engineer, Mr. Agudio, and recommended by the several engineers commissioned by the Italian and French governments, as well as by the delegates of various railway companies who attended the series of practical experiments that took place in the month of August, 1875, at Lanslebourg, Savoy. The inclined plane would have a length of nearly 6,000 meters, with only one curve of 450 meters radius, and of various grades, the heaviest being one in five. An altitude of 1,000 meters being gained in this manner, the line would continue 3,000 meters further with a grade of 1 in 36, to the entrance of a tunnel which would have a length of about 3,750 meters, and emerging at the side of the Cueros river at 3,180 meters high. This shows that the valley at the eastern side of the mountain is about 1,000 meters high, which is, to a certain point, an advantage, requiring only grading on one side. Both the Juncal and Cueros rivers would at all times furnish ample water power to work the turbine water wheels, with which power the cars would be lifted. There is also a small lake at the summit of the incline, the water of which can with facility be applied to the same purpose.

With this system the cost of construction would be reduced some \$4,000,000, and, according to the report of the joint committee of engineers, the working expenses of a line of this class, taking into consideration the corresponding development required in the other system, are in proportion very much less.

**PROPOSED NARROW GAUGE.**—The St. Louis Board of Trade is urging the project of the construction of a narrow gauge railway from St. Louis to Colorado, through Missouri and Kansas. The construction of this proposed railway through Kansas to Trinidad, in Colorado, will give St. Louis direct railroad connection with the entire system of narrow gauge railways in southern Colorado and open up to their smelting interests the whole range of valuable mining country of Colorado, Utah and Arizona. This road is but one item of a grand onslaught which St. Louis proposes to make upon outlying regions. The St. Louis Journal of Commerce says: "The jetties of South pass have assured ample water for all vessels to enter the Mississippi river and made a direct trade between St. Louis and all European ports practicable, and it becomes the duty of St. Louis to seize upon this advantage and develop herself a commerce which shall absorb her from all dependence on the Eastern seaboard. Her efforts in this direction will be greatly assisted by the building of the proposed narrow gauge railway, penetrating, as it eventually will, by means of the numerous branches proposed to be connected with its main line, the most fertile regions of Missouri, Kansas, Nebraska and Colorado."

**THE JETTIES.**—From the latest reports from Capt. Eads it appears that in 60 days a ship drawing 22 feet of water can pass from New Orleans to the sea. The addition of another foot or two to the depth of the channel will only be a matter of time.

## Moving Cleopatra's Needle.

Engineers of the present are about to attempt a problem which Cleopatra's workmen successfully solved. A correspondent writing from Alexandria, Egypt, gives the following account of the arrangements prepared for transporting Cleopatra's needle to England. The "needle" is a monolith 69 feet long and eight feet square—not uniformly, but at the base. It weighs about 220 tons, and lies in the sand 15 feet above high-water line. To get this mass safely into the sea and across the sea, it is intended to build up around it on shore a cylindrical iron case or ship, and then to roll the entire mass, nearly 300 tons, into the Mediterranean, and when the necessary ballasting and additions have been made to the ship in dry-dock, to have her towed to England. The iron vessel is now being made at the Thames Iron Works, and when ready will be sent out here in pieces, to be built around the obelisk, under the superintendence of Mr. Wayman Dixon, brother to Mr. John Dixon, the enterprising designer and contractor. The vessel must be considerably longer than the obelisk, because of the shape of the stone. It will be 92 feet long and 15 feet in diameter, with plates three-eighths of an inch thick. It will be divided into nine watertight compartments by eight bulkheads; total weight of iron, 75 tons. To lift the end of the obelisk jacks of immense power will have to be sent from England, and after the cylinder is built tremendous tackles will be required to roll it into the sea. It will float in nine feet water, and to reach this depth it must be rolled 400 feet. Once afloat and in dock it will be fitted with bilge keels, rudder and steering gear. It will be cutter-rigged, with one mast and two sails, and will have a deck-house for Mr. Carter, who will have charge of it on the voyage; for, although it will be in tow of a steamer, it will be in every respect a ship, and able to take care of itself for a time in case of accident or breaking away of the tow lines, which are to be of steel wire. If the undertaking is a success, the entire expense will be borne by Mr. Erasmus Wilson, the eminent surgeon. Immense care and nicety will have to be exercised in obtaining the necessary strength and rigidity; the obelisk must be so packed, forming with the iron cylinder one solid mass, as to avoid any strain from the rolling into the water, or from the heavy working of the ship afterward. I presume the most anxious part of the work will be to get the vessel and her precious cargo into the sea. Once afloat other difficulties will be mastered. Three thousand five hundred years ago this obelisk formed one of the pillars in front of the great Temple of Tum (the setting sun), at Heliopolis (near Cairo), and was brought to Alexandria during the reign of Cleopatra. No accounts exist of the appliances used; but if this and larger monuments could be safely moved about some 1,600 years B. C., it is not possible to doubt our ability to do likewise in the 19th century A. D.

## Splicing Wires for Bridge Cables.

Work is progressing rapidly on the Brooklyn bridge. The wire, as it comes from the factory, is in coils, containing about 1,000 feet. As each coil is oiled it is drawn to the top of the anchorage and placed on a flat drum which moves horizontally. From this drum the coil is wound with great care over a wheel four feet in diameter, moving about a horizontal axis. This wheel and its carriage are placed in position before one of the drums. It is then necessary to fasten the end of the wire to that already on the drum. A workman steps up with a double vise, in which he puts the two ends of wire which have been previously threaded, and joins them by a hollow nut of crucible steel two inches long and an eighth of an inch thick. The inside of the nut is threaded in opposite directions, to conform to the threads on the ends of the wire. The nut is then fastened in a hand vise, by which it is screwed up so as to bring the two ends of the wire almost together. By aid of this contrivance the joint is given 96 per cent of the strength of the wire. When the fastener steps to another drum, a man, with a box of chemicals and acids, cleans the joint. Then another, with a pot of melted zinc, gives the joint a bath, in which some chloride of ammonia has been thrown to destroy the dross. Another man, with a tool, runs the zinc well on to the wire to galvanize it thoroughly. Next a man, with a pan of linseed oil and a piece of sheep's skin rug dripping with oil, seizes the wire where it has been joined and holds it fast in his oily grasp, while the other workmen carefully wind it from the small reel to the large drum.

Although the popular impression is that the cable is to be of twisted strands of wire, the contrary is true. The wires are kept parallel, and as soon as 133 wires are sent across the river they will be tied with temporary wrappings. These will make one of the 19 strands of which one cable is made. There are suspending pendulum rods from one of the wires to prevent the entangling of the wires as they pass to and fro and are fanned by the wind.

There are now four wires in position on each of the down-stream cables. These are the first wires that have been put up that will enter into the big bridge's ultimate structure. It will take about two years to carry across the 24,000 wires.

## Two New Bridges at Rotterdam.

Dutch engineering skill and enterprise have just completed an undertaking of a magnitude second to none of the many great works achieved by the Dutch before. It is well known that for centuries the Dutch people have waged constant war against the encroachments of the sea and the rivers by which their country is intersected. The hydraulic works are the first in the world; their bridges at Kutphen, Kuylenburg and Maesdijk rival those of America. The Builder says: Another, the new railway bridge which crosses the Maas at Rotterdam, has just been added, which was formally opened on April 29th, and the importance of which for Holland need hardly be pointed out. The work, after an expenditure of 2,000,000 florins (£160,000), of which rather more than half has been expended on the superstructure, and less than half for the substructure, has been completed within eight years, about the same time required for the construction of the similar bridge at Hamburg, and that between Venice and the continent. Five gigantic wrought-iron arched girders, resting on granite piers, and of spans ranging from 216 feet six inches to 295 feet four inches, and a height of nearly 20 feet above ordinary high water level, connect the city with an island in the middle of the stream, two other arches uniting this island with the opposite shore. Another great work at Rotterdam is now in course of completion, which has attracted general attention on the continent. A few paces below the railway bridge, another bridge, the so-called "Willemshbrug," to serve for the ordinary carriage traffic of the city and foot-passengers, is in course of construction. The foundation-stone of this bridge was laid three years ago by the king of Holland in person. This, like the railway bridge, is provided with two pivot arrangements, of which one is within the city and the other in the canal called the King's Harbor (Koning's Haven), 656 feet wide, between the opposite shore and the island above mentioned, to permit the passage of the largest ships.

## The Krom Concentrator.

The Krom concentrator, now in operation at Somehow, near Jefferson City, is attracting a good deal of attention from all who own silver-bearing lodes requiring concentration before being placed upon the market. It has proved a success beyond a reasonable doubt. It has been tested upon all kinds of ores, tailings, etc., and the result has more than met the sanguine expectations of the Montana company or the claims of the inventor and patentee. Ore concentrating machinery has been one of the problems of the mining age, for without some method of concentration ores bearing but a small percentage of mineral have been of no value, in fact an incumbrance upon the dumps. It was also apparent that the rich bodies of ore are less common than lean ones, and in many mines the cost of reaching their rich pockets was more than the ore taken from them was worth. With limited milling facilities and an unusually large quantity of base metals in all the mining camps of Montana, concentrating works are of the highest importance; in fact, an absolute necessity to her prosperity. Even milling ores rich enough for shipment contain a large per cent. of refuse matter, upon which heavy charges have to be paid for freight, and thus lessen, in no small degree, the profits on all the ore sent abroad for reduction. Mr. Krom's invention seems to be well adapted to the purpose of accomplishing this object, and we fully believe the present machinery is but the forerunner of much other of like character that will be in operation here in a year or two. Here is a fine field for capitalists to turn their attention to profitable investments. There is an abundance of ores to crush at Vipond, Butte, Runley, Comet, Clancy and many other points, and concentrators doing custom work could be kept constantly running. We know of no country that presents so many inducements to capitalists as Montana does at present. Because there is here room for plenty of milling machinery and concentrating works, and plenty of lodes that can be purchased at low rates, because the owners are unable to develop and work them.—*Helena Independent*.

**BELL RUN.**—A correspondent of the Silver State, writing from White Rock, says: Times up this way are pretty dull, partly owing to the fact that mining companies do not pay regularly. Since the 1st of June the Leopold company have reduced their working force considerably, and are carrying on their works as economically as possible. Wood delivered at the mill commands the following prices: pine, \$13; fir, \$11, and cedar and other wood, \$10 per cord. As the wood in this vicinity is principally fir, it makes it hard on those engaged in the wood business. Last year fir sold readily at \$12 per cord. From all reports we are going to have a new camp in a very short time, which bids fair to benefit the people more than the Leopold or Hussey. It is to be at the Mountain Laurel mine, owned by Duncan & Co., which experienced miners say is the best prospect in this part of the country. They have about 300 tons of ore on the dump, and are making arrangements to have it worked at the Vauce mill, at Mountain City. It is believed that the property will change hands inside of twenty days, and that a mill will be built near the mine. A lot of ore from this mine worked at Mountain City yielded \$140 per ton.

## California at the Philadelphia Exposition.

We find in the Philadelphia Press the following paragraphs. One of the noticeable attractions of the exhibition is the California pavilion, which is situated near the musical platform and in front of the Log Cabin. It is made of oak-barked cedar; the roof is thatched with moss from Monterey, and a spire of vines extends far up into the rotunda of the main building; its rustic posts are ornamented with flowers, cones, vines and feathery pampas grass, and its entire arrangement is indicative of the artistic skill of its proprietor, Mr. J. R. Begg, who is well acquainted with the productions of the Golden State, having been a donor there for many years. He exhibits a fine collection of Languedoc almonds, Malaga, Genoa and Sicily lemons, and Mexican limes, all raised by Mrs. Geo. C. Swan, in Paradise valley, San Diego county, California, and if the flavor and taste of these fruits partake of their native soil, their brightness must be a paralytic to the eye in the land. Magnificent pine-apples, dates, oranges and lemons are also exhibited and for sale at this pavilion. Suspended from the roof is an enormous Pimento orange, which measures 23 by 24 inches, and was grown by Mrs. Brewster, of Paradise valley, Cal. It is really a prodigy of nature, but whether it is as good and luscious as the other fruits from the same place remains to be found out, for no five as yet has pressed it to her rosy lips.

Another novelty is truck soap, a natural production, which is dug out of the earth in southern California, and without any preparation is excellent for scrubbing up things in general, but particularly for polishing silverware. Any one having a bed of this useful mineral on his farm need have no excuse for dirty hands.

There is also to be seen here a specimen of the *Yucca brevifolia*, which is found in large quantities in the dry, sterile sand of the Mojave desert, where nothing else will grow. It is valuable as a paper-producing plant, and there is now a company organized in California for the purpose of supplying the newspapers of the world with pulp, which they are quite able to do. Mr. Begg has on hand pretty little card baskets and fancy articles made out of walnuts, which are cleaned, sawed, varnished and curiously wrought together; also a large variety of canes, boxes, sleeve buttons, Centennial bells, goblets, etc., manufactured from the celebrated Big Tree. These articles are sold at moderate rates, and are very desirable as mementoes of the exhibition and our beautiful sister State lying along the Pacific.

Everybody has heard of the wonderful Big Tree, and it is a fact that if some of the fallen trees in the Calaveras grove were burned out a man could ride on horseback—ride for 200 feet, and come out at a knot-hole in the side. Their bark is 23 inches thick, and, when crumbled up, makes excellent material for stuffing pin-cushions. An olive tree, in bearing condition, is now on its way from California, and will be added to the display next week, while fresh fruits will arrive from time to time during the summer.

Mr. Begg is a man of large experience and extensive information, and the many visitors who daily call at the Pavilion, find his conversation as attractive to their mental appetites as the rich tropical fruits are to their palates.

**STORM SIGNALS FOR MINE USE.**—It has been decided in France to send notice to the various coal mines of any sudden fall of atmospheric pressure recorded at the several meteorological observatories. It is well known that the outflow of fire-damp is greatly increased by a sudden fall in the atmospheric pressure, and nearly all fiery mines now use the barometer as an indicator of the amount of ventilation required. In addition to the barometer readings at the mines the Government weather report, which would indicate the approach of a dangerous atmospheric disturbance before its arrival, would, no doubt, in some cases, be the means of preventing dangerous fires and explosions in mines producing fire-damp in large quantities. The matter is worthy the attention of those in charge of such collieries, and no doubt, upon suitable application the Government would send such reports to the principal mining districts interested.

**CARBONATE POINT DISTRICT.**—This new district is situated about ten miles west of Ellsworth, Nye county, and six miles south of Lodi. The Belmont Courier says: From reliable information collected from parties who have visited the mines they must be of immense value, thousands of tons of ore being in sight. Average assays from the Lizzie ledge give \$141.45 per ton in silver and 96 per cent. lead. Average assays from the Western ledge give \$131.93 per ton silver and 84 per cent. in lead. The owners are sacking ore, without selecting it, to the reduction works at Sacramento, where they get the highest rates offered at the reduction works, 90 cents per ounce for fine silver and no charges for reduction. The Illinois company only get 75 cents per ounce. Water is scarce, being five miles distant, and by sinking 80 feet plenty of water can be obtained. Wood is abundant three miles from the mines.

The proprietors of the Sturtevant house, New York, announce that they will have no bills against army officers who may become guests of the hotel until after Congress votes an appropriation for the army.

## USEFUL INFORMATION.

## The Science of Floor Scrubbing.

"Top-dust" can be washed off without great labor. Have the water only moderately warm, especially when the floor is of soft wood, because hot water sinks so rapidly, and occupies so much more time in drying, than cold water upon wood. Drain the mop pretty well before putting it upon the floor, thus wetting the floor but little. The object is to wipe up the dust as thoroughly as possible, running it off from the mop into the water, and changing the water for cleaner very often. If you put much water upon a very dusty floor, you have a big troublesome mud-puddle to mop up or rinse away. Experiment has convinced me that a floor of pine or basswood looks best after cleaning, if a small amount of water has been put on each portion of it. Use as much water as you please on the whole floor, the more the better, if you wash and wipe only a small portion at a time, and then throw out the dirty water, and begin the next division with clean water. The sooner a soft wood floor dries, the better it looks. I have seen women work very hard to scrub a pine or basswood floor white, and the result has been quite disappointing. They would put a great deal of water upon the floor and then scrub with a broom hard and long; after this would sweep all of the dirty water out, and rinse the floor with as many waters as they could afford. When at last the well-soaked floor was dry, it was undoubtedly clean, but it looked dark and somewhat weather-beaten, in consequence of remaining wet so long. It is a question of health with me, in winter, to have a floor dry as soon as possible. A little lye in the water has an excellent effect upon floors. It may be poured directly upon decided greasy spots, but the whole floor is whitened with very little hard rubbing, if a small amount of lye is mixed with the water. Too much makes the boards yellow. How much should be used depends upon its strength. Never put lye into the water with which you wash a painted floor, else you gradually but steadily remove the paint with each cleaning. If you let an inexperienced hired girl have her own way with a painted floor, she will probably use her boiling suds upon it, and soon remove nearly all of the best paint. Clean warm water is best for painted floors. If you have a nice hard-wood floor, be thankful, especially if it be of white ash, but never let its spotlessness become dearer to your heart than the family peace. You learn by experiment how much nicer one of these hard floors looks, when washed with clean suds, than when washed with the boiling suds of Monday.

Let those who like get down upon their knees, and scrub their floors with brushes and floor-cloths—such work is not for me nor mine, and I consider it pitiful business for any one. I hear of long-handled scrubbing-brushes, and doubtless these are suitable for human beings in the work of floor-cleaning. What I most want is a cheap and easy mop wringer, for I dislike extremely to put my hand into the mopping water. Of such a wringer I have heard, but have had no experience of its merits.—*A Scrubber in Exchange.*

**LEAD TUBING WITH TIN LINING.**—The *Hanover Zeitschrift* refers to the subject of tinned lead tubes, quoting Thiem, of Regensburg, who states that his experience has led him to judge ill of them. He has found that they will resist the pressure proof, but do not stand water pressure after continued use, and therefore does not advise their employment where the water pressure is high. But in opposition to his views, it is found that when the piping has been soundly made according to contract it answers perfectly well. Faulty specimens were found either to be below the normal weight, or to have a lining less than half a millimeter thick or to have the lining unequal. In Dresden, as well as in Vienna, tinned piping is in good repute, the accidents that have happened being laid to the account of frost. In Heidelberg and other South German cities galvanized-iron piping has lately been used, and has given satisfaction. An indirect advantage of their use is found in their immunity from depredation.

**TO COUNTERACT THE DAMPNESS OF WALLS.**—The *Governeur-Blatt* (as translated by the *Politechnic Review*) gives a recipe for a solution said to prevent the action of moist atmosphere upon walls. A wall exposed to cold and moisture should be, it says, coated with a compound of three-quarters of a pound of soap dissolved in ten pounds of boiling water, care being taken in applying it to avoid the formation of bubbles. A little alcohol assists in dissolving the froth, and causes the solution to penetrate deeper into the wall. A second coating is added after twenty-four hours, composed of a solution of sulphate of alumina, about half a pound in 30 pounds of water. The coating obtained is, it is added, impermeable. If the first coat is not dry and hard in twenty-four hours it must be left a longer time. The action relied upon here is the formation of an insoluble alumina soap.

Oxygen and hydrogen explode by the electric spark when mixed with five times their bulk of steam. A mixture of air and carburetted hydrogen requires a third of steam to prevent its inflammation.

**Gun Cotton.**—The following instructions have lately been issued for dressing compressed gun cotton:—(1) When time permits, the simplest way of drying gun cotton is to expose it to the air of a dry room until it ceases to lose weight, or to place it in the open air during dry weather in situations where it will be exposed to sun or wind. With a dry atmosphere gun cotton may be dried by exposure to open air, even without sun, in about five days. (2) When it is desired to dry gun cotton quickly steam heat should be used, and a special apparatus has been constructed for use in the hotel and at stations for carrying out this operation safely and expeditiously. This apparatus consists of a boiler and a drying-chamber, which are placed, when required for use, with an interval of about 6 feet between them, and are connected by means of an india-rubber tube.

**THE TRADE IN HUMAN HAIR.**—The trade in human hair continues to increase at Marsella, and has now become a staple article of commerce in that city. Six or seven years ago the annual quantity imported did not exceed 16 tons, but it had increased in 1873 to 50, in 1875 to 90, and in 1876 to 92 tons. Formerly all the hair imported into Marsella came from Italy, but that country has been unable to meet the increasing demand, and a brisk trade has been opened with the extreme East. Thus, of the 92 tons imported last year, 43 came from Italy, while China supplied 26, Turkey 5, and Japan 3 tons, the remainder being made up of importations from Egypt, India, Germany, Belgium, Spain and Algeria. The total quantity of hair imported into France last year is estimated at 122 tons, value \$800,000, so that Marsella, with 92 tons, has three-fourths of the trade in her own hands.

**ASPARAGUS PAPER.**—A man of science, writing to the *Patrie*, explains what is the principal use to which the bundles of white stalks of asparagus, from which the tips have been bitten, may be put. They may be made into paper, and that not ordinary brown paper, or even book-paper, but better paper of the finest description. It appears that in a few favored places there are manufactories where the asparagus ends are used in this way, and where the careful housekeeper boards up the scraps with a diligence unknown elsewhere. But the work of collecting them is an up-hill task as yet, and it will be years before, in the natural order of things, the practice of saving them and packing them off to such factories for sale is at all generally adopted.

## GOOD HEALTH.

## Danger in Self Dosing.

There is a host of people who seem to have little else to do but to consider their physical condition and to administer doses for its improvement; people who are positively dissipated and intemperate in their use of medicines, and appear to think this world not so much a vale of tears as a vale of drugs; people to whom a new prescription affords a delight only equalled by that which a servant would experience from the possession of a bone of the extinct megatherium.

If they are in the least under the weather it never comes to them to allow Nature to work out her own salvation, but they take her affairs into their own hands, and having small acquaintance with her processes, the result resembles that of a novice attempting the tasks of a superior, and making them more difficult for that superior to accomplish. One of the peculiar pleasures of such persons consists in persuading others to try their methods of cure. The most delicate compliment you can pay them is to swallow some nauseating mixture upon their recommendation, which all the while bears a strong family likeness to that of those who, with bad conceptions, assure you that soap is wholesome for the skin, or of bald people who extol the virtues of certain washes they have employed.

This art of dosing does not interfere, however, with the usefulness of the family physician, but rather supplies him with practice by laying the foundation for positive disease. The stomach, which has been unwittingly converted into a length; the nerves that have been too often artificially another finally refuse to acknowledge the power of the charmer; the strength engendered by stimulants proves but a broken reed; appetite fortified by frequent tonics surrenders some day without reserve.

If the science of medicine itself is as yet only experimental, must not amateur dosing, beyond question, belong to the most objectionable class of empiricism?—*Dr. Holbrook.*

**LONGEVITY OF THE ISRAELITES.**—Dr. R. W. Richardson, of London, has recently investigated this subject. The result of his research has shown that, both on the continent and in England, Jews possess a higher vitality than do the general community by whom they are surrounded. Tracing the causes for this greater longevity, he says he cannot attach too much importance to the sanitary laws that obtain among the Jews, instancing those in regard to diet, cleanliness and abstinence from strong drink. In fact, the Decalogue from beginning to end is one sanitary lesson, teaching them to subdue the passions which torment the brain and distress the body.

## Danger in Vinegar.

There are more kinds of so-called vinegar in the market than brands of family flour. The *New York Tribune* thus alludes to one of the. The Board of Health of the District of Columbia has condemned five car loads of vinegar sent there from Chicago, on the ground that it is not a genuine article, and is injurious to health. An analysis of the so-called vinegar has been made. It appears, according to the report of the Board of Health, that the vinegar contains 54.54-100 grains per gallon of anhydrous sulphuric acid, combined with lime to form a sulphate of lime equivalent to 117.26-100 grains of gypsum per gallon, and besides that, five grains of free sulphuric acid per gallon. The Board also report that this sample was taken from an invoice of more than 1,000 barrels brought there to be sold as vinegar, and that it is likely to find a ready sale on account of its low price. The report concludes as follows: "When we think that oil of vitrol sulphuric acid can be bought at five cents per pound, and that a pound of such acid would render a barrel of fluid as acid as the strongest vinegar, the wonder will cease that it is so cheap. This, therefore, is a fraud upon consumers, and a dangerous mistake for vinegar. The fraud and danger are more general than the great mass of people will readily believe. It is asserted that probably one-half the vinegar sold at city groceries is a rank poison, with either sulphuric or other objectionable acids for its base, from which the acetic principle is evolved, the same as in the manufacture of acetic vinegar or the acetates used in calico printing. Acetic acid is present in all vinegars, although they seldom contain more than five per cent. of the absolute acid. Their color, flavor and value depend materially upon the ingredients from which they are made. In England, honest vinegars are usually made of malt; in France, of grapes; in Germany, of grapes, beetroots or potatoes; in this country, of apples and grapes.

## Wedding Journeys.

When a young man and woman marry, they generally think they must take a wedding trip, of greater or less extent, according to their purse, as long or short. The idea is well enough in its place, if carried out in accordance with the laws of hygiene; but this is not always the case. We have just received a notice of the death of a friend, a beautiful and noble young lady. The cause was a cold caught on her wedding tour. Such cases are not rare; but even when death does not result, injuries which last for life may be received. It would be far better to give up the wedding trip than to injure the constitution by it. There is never a time more unsuitable to journey than just after marriage. The feelings are then at their highest pitch, and they adventure the fact by every look and movement, so that they are recognized wherever they go as a newly married couple. There ought to be a reform in this matter of wedding tours. Physiologists and hygienists should set the example. Let them be conducted strictly in accordance with the laws of hygiene, or given up altogether. It is said that the daughter of Dr. Hammond, recently married to an Italian marquis, has set a good example in this respect. The father, an eminent physician, stamped the idea of a wedding journey as something barbarous and unphysiological, and so, after the marriage, by his advice, the couple were left to spend at their own home. If this is so it is an example well worth imitating. At any rate, let no newly married couple violate every physiological law by a wedding journey that may injure the health past all recovery.—*Harold of Health.*

**A SCOURGE.**—A scurf in man is called *fourder* in a horse, and is over-eating, eating more than the stomach can possibly convert into beneficial food. Wise men and careful men will sometimes inadvertently eat too much, known by a feeling of fullness, or nausea, or a discomfort which pervades the whole man. Under such circumstances, we want to do something for relief; some eat a pickle, others swallow a little vinegar, a large number drink brandy. We have swallowed too much, the system is oppressed, and nature rebels, instant comes to the rescue and takes away all appetite, to prevent our adding to the burden by a morsel or a drop. The very safest, surest, and least hurtful remedy, is to walk briskly in the open air, rain or shine, sun, hail, or hurricane, until there is a very slight sudor on the skin, then regulate the diet, so as to keep the perspiration at that point until nature relief is afforded, indicated by a general abatement of the discomfort; but as a violence has been offered to the stomach, and it has been weakened with the extra burden imposed upon it, the next regular meal should be omitted altogether. Such a course will prevent many a sick hour, many a cramp, colic, many a fatal diarrhoea.—*Health Journal.*

**TO AVOID SLEEPINESS.**—If you wish to sleep well, eat sparingly of late supper. A void all arguments or overcasted subjects after night, as these are likely to have a bad effect upon one who is troubled with sleeplessness at night. Avoid having too much company. Many persons become so excited with the meeting of friends that sleep departs for a time. There is probably nothing better, after enjoying a tranquil mind, than exercise in the open air. By observing these simple rules, sleeplessness, in the majority of instances, may be cured.

# MINING AND SCIENTIFIC PRESS

W. B. EWER.....SENIOR EDITOR.

DEWEY & CO., Publishers,

A. T. DEWEY, GEO. L. STRONG,  
W. B. EWER, JNO. L. BOONZ.

Office, No. 224 Sansome Street, S. E. Corner of California Street, San Francisco.

## Subscription and Advertising Rates:

Advertising Rates.	1 week.	1 month.	3 mos.	12 mos.
Per line.....	.25	.80	\$ 2.00	\$ 5.00
Half line (1 square).	\$1.00	\$3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Four insertions are made in a month.  
Subscription in Advance—Postage paid—one year, \$4; six months, \$2.25; three months, \$1.25. Remittances by registered letters or P. O. orders at our risk.

Write for the MINING AND SCIENTIFIC PRESS. We invite not only professional men, but practical miners and mechanics to contribute to our columns. All communications will be kindly treated. Authors, as well as readers, will be benefited by corresponding.

Address all letters to the firm, and not to individual members, or others, who may at any time be absent.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, July 7, 1877.

## TABLE OF CONTENTS.

**GENERAL EDITORIALS.**—Calculating Machines; Mining in Amador; Academy of Sciences, 1; The Silver Mud Springs of Oregon; Pavement of Sluices; Closing Down of a Famous Mine; 8; The Twelfth Industrial Exhibition; Compound Mining Pump; Cost of Production at the Mount Diablo Coal Mines; 9; Notices of Recent Patents, 12.

**ILLUSTRATIONS.**—Grant's Calculating Machine, 1. Mechanics' Institute Medal for 1877; Compound Double Plunger Pump for Mines, 3.

**CORRESPONDENCE.**—From Monterey, 12.

**MECHANICAL PROGRESS.**—The Iron Industry in 1876; A New Electric Motor; A New Steam Crane; Nickel Plating; Inclined Plane Railway; Making Marble From Slate; Cotton Seed as Boiler Felt; 3.

**SCIENTIFIC PROGRESS.**—Spontaneous Generation; Deep Sea Life; A Discovery; Wonders Under Water; Obtaining Light by Burning Quartz; Geological; New Spectroscope; Toughened Glass in the German Army, 3.

**MINING STOCK MARKET.**—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 4.

**MINING SUMMARY.**—From the Various Counties of California; Nevada, Arizona, Colorado, Idaho, Montana, New Mexico and Oregon, 5-12.

**THE ENGINEER.**—A New Transandine Railway; Proposed Narrow Gauge; The Jetties; Moving Cleopatra's Needle; Splicing Wires for Bridge Cables; Two New Bridges at Rotterdam, 6.

**USEFUL INFORMATION.**—The Science of Floor Scrubbing; Lead Turning with Tin Lining; To Counteract the Dampness of Walls; Gun Cotton; The Trade in Human Hair; Asparagus Paper, 7.

**GOOD HEALTH.**—Danger in Self Dosing; Longevity of the Israelites; Danger in Vinegar; Wedding Journeys; A Surfeit; To Avoid Sleeplessness, 7.

**GENERAL NEWS ITEMS** on page 12 and other pages.

**MISCELLANEOUS.**—English Lead Mines; American Locomotives in England; Separating Nickel from Ores Containing Iron; New Mexico Mines; Distilled Water for Marine Boilers, 2. Mining in Sierra County; A New Railway Signal; New Diggings; The Krom Concentrator; Bull Run, 6. California at the Philadelphia Exposition; Storm Signals for Mine Use; Carbonate Point District, 7. Pluck Rewarded by Luck; Central District; Improved Biddle; Does Mineral King Need a Furnace? 10. Items of Interest from the Mines; New Incorporations, 12.

## NEW ADVERTISEMENTS.

Golden Gate Academy, Oakland, Cal.; Assessment Notice—California Fruit Growing Association; Water Pipe, American Pipe Co., S. F.

## The Week.

The week just passed has been occupied pretty fully by preparations for the Fourth of July all over the country. For the few days preceding our National holiday and a day or two succeeding it, work is partially suspended, and when it comes in the middle of the week, as it did this time, the week is pretty well broken up. The celebration in the city was a success, and great crowds of people witnessed the procession, the regattas, etc. Our citizens having now demonstrated their patriotism by observing the day, are ready again to settle down to every-day business.

There were no fireworks in the city, but at Badger's Park, Oakland, where a varied entertainment was given for the benefit of the Oakland Free Reading Rooms, they had a display of fireworks which was witnessed by a large crowd of people. A noticeable feature of the celebration was the attention paid to the literary exercises.

The MINING AND SCIENTIFIC PRESS this week commences its 25th volume under favorable auspices. We hope to continue to keep all our old readers and add many more to the list before the year ends. We shall endeavor to keep the PRESS up to the standard of a first-class mining, scientific, and mechanical journal, and continue to devote it specially to the interests of the industrial classes on the Pacific coast. We begin the volume with energy and confidence, and assure our readers that we will do all we can to further their interests by furnishing a readable and valuable paper.

## The Silver Mud Springs of Oregon.

Some months since an article went the rounds of the press relative to the discovery of certain mud springs in Wasco county, Oregon, the mud from which assayed all the way from \$300 to \$12,000 per ton in silver. There were said to be a number of boiling springs which were continually throwing to the surface a mushy substance resembling soap and strongly impregnated with alkali, in which pure chloride of silver was found in large quantities. Specimens of this curious substance were sent to Professor Silliman, at New Haven, who made an analysis and sent us the results, which we published in our issue of December 16th, 1876. He pronounced the whole thing a fraud, stating that the mud was salted. He found no silver chloride at all, but found the silver in the pulp in a metallic state. He explained in this letter how he detected the thing, and said that any miner could at once solve the riddle by washing a small particle of the stuff free of slimes, and rubbing down the heavy grains in an agate mortar, or between two slips of glass, when the brilliant grains of polished metallic silver will at once appear as thin scales.

In our last issue we gave an article read before the Geological Society on this subject by Henry G. Hanks, and also a letter from Richard Hurley making a statement concerning the occurrence of the springs. Mr. Hanks in his paper doubts their being an artificial production, as his investigations lead him to suppose the product natural, for reasons expressed in his paper.

The *Mining-Immigration Journal*, a paper published in Portland, Oregon, has had a good deal to say recently of this "silver mud," but does not believe in the existence of any silver in the mud. On investigation the reports published from that section were found incorrect. The *Journal* says: We have had specimens of the mud brought directly to us, taken from a depth in some instances of 27 feet, from "soap" holes, the mud from which was reported to have assayed from \$4 to \$800 to the ton, tested thoroughly and not a trace of anything valuable could be discovered; quartz, some of it from the celebrated strike said to have been made by some Alhany "boys," was also tested with the same result. Moreover, we are informed that no quartz ledges whatever exist in that locality; the quartz being what is called "float" quartz, which can be found in almost any locality in the State. The reports are so entirely different from what we were led to suppose, that we have no hesitation in saying, we at least are thoroughly convinced, that there is no merit whatever in the so-called "silver springs." We also believe the management of these mines has been, to say the least, imprudent. We can imagine no good reason why it would not have been practicable to have made a large shipment of this mud in barrels or otherwise, either to Portland or San Francisco, for amalgamation and treatment, thus thoroughly testing its value, before going to the expense of purchasing and shipping machinery to the ground. Even if there was silver in the mud the extractions so far reported made, have been from such minute quantities that as a mere matter of precaution it would seem such action on the part of the directors would be more satisfactory and business like. The detriment to the interests of Oregon of ill-advised mining excitements is our sole reason for stating these—what we consider—facts.

The *Journal* states that disinterested persons of experience who have visited the district say there are no quartz ledges there. It says in another article: The mud which we have tested, was taken from "soap holes," that had assayed according to report circulated, from \$4 to \$800 to the ton; the test made here for us showed that it contained nothing whatever, and it also seems from the card mentioned that other tests made of mud lately brought down, only yielded silver after repeated assays; that is to say, several assays had to be made before any mud was found which had anything valuable; we are told that only one assay out of five of these showed silver, and in reference to this, we have heard—but it is merely hearsay evidence—that the yield amounted to one dollar and forty cents per ton.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: Modoc, June 26th, 235 bars, value \$3,900.71—total to date, \$48,453.67; California, 27th, \$187,872.94; Con. Virginia, 27th, \$155,672.78; Northern Belle, 26th, \$9,791.47; Tyho Con., 26th, \$8,753.22—total to date, \$88,838.91; Grand Prize, 29th, \$8,000; Chollar—total for June, \$34,626; Northern Belle, July 1st, \$15,123; Arizona, July 1st, \$3,274; Indian Queen, June 27th, \$1,114; California, July 3d, \$405,847—total to date, \$1,567,930; Grand Prize, July 3d, \$8,000; Leopard, July 2d, \$6,700; Ophir, July 1st, \$9,176; Leeds, July 4th, \$4,583; Con. Virginia, July 3d, \$263,911—total to date, \$867,827; New Coso, July 2d, \$6,864—total for June, \$70,064.

It has been reported for the past 30 days that the miners working at the bottom of the combination shaft, in Virginia City, could hear the blasts set off in the header of the Suto tunnel. For the last few days the blasts in the combination shaft are distinctly heard by the miners in the Suto tunnel, which is conclusive evidence that the latter is rapidly approaching completion.

## Pavement of Sluices.

In the issue of the MINING AND SCIENTIFIC PRESS of June 16th we published an article on this subject, illustrated by sections of rock and wood pavement. A correspondent from Calaveras county, signing himself "F. S.," referring to the article, sends us also his experience with pavements, which we give as follows:

Block pavement is generally discarded by those who know better, excepting in places where but little grade can be had or suitable paving rocks are not convenient. Blocks are generally sawed from logs of a trifle larger diameter than the width of the flume and then trimmed to fit. Such blocks give triangular riffles at the sides, save labor in construction, and cannot be displaced by vibration when the side lining is added.

The rock pavement, as represented in your illustration, would be rather difficult to obtain, as the rocks would have to be of uniform length. Hard, smooth cobbles of an oblong shape, from eight to eighteen inches in length, make a superior pavement in all respects where sufficient grade can be had. Begin at the lower end of the flume, lap the most suitable end of each rock on the row below it, say from two to four inches, being careful that the crests of the overlapping ends are as near as possible of uniform height. When the paving is completed add the side lining as usual, then chink up with wood or rock the spaces which may be between the lower edge of the lining and the crest of the rock under it. Now turn on water sufficient only to carry sand and small pebbles, taking care that the sand fills completely all interstices in the pavement. Then allow, gradually, larger pebbles and more water to pass through the flume. If properly done, not a single paving stone can be dislodged even by good sized rocks driven by a large head of water. Such pavement can be used in a flume of any desired width, is cheaper and superior in attritive action, and gives a larger gold-saving area than all other pavings for like purposes. It was used successfully in Sierra county seventeen years ago.

In 1855 I used cast iron riffles two feet in length, as wide as my flume, in shape similar to a common wash board, with rim at ends and sides as high as the bars. They were excellent and very convenient gold-savers, but not adapted for general use.

## Closing Down of a Famous Mine.

The old Eureka mine, at Grass Valley, which has made such a splendid record for itself as a bullion producer and dividend payer, for a long period of years, has been closed down permanently, showing that all things, no matter how good, must have an end. The mine has been famous, not only for its profitable working, but for the good and honest management under which it has been conducted. Mr. Wm. Watt has been the Superintendent for the past twelve years.

According to the last annual report, the receipts and disbursements of the company, from the date of its going into operation, October 1st, 1865, to September 30th, 1876, were as follows: The total receipts were \$4,528,254; the dividends paid were \$2,094,000; milling and mining expenses, \$1,923,812. The *Union*, in speaking of the mine, says:

"A month or more ago a dividend of \$40,000 was declared, making a total of \$2,094,000 paid out for dividends by this company. The amount taken out of the mine must be something over \$5,000,000. The Idaho, which adjoins the Eureka on the east, has taken out almost as much, and is still paying magnificently, having pay ore in the lowest depth yet attained—1,900 feet. The two mines, as far as worked, have furnished to the world about \$9,000,000 worth of gold.

"The Eureka worked out the pay chute at about the depth of 700 feet. The pay went into the Idaho company's ground, and shows every sign of going down to an indefinite depth.

"The Eureka has never levied an assessment, and its last act will be to declare a dividend. This dividend will be in the neighborhood of \$30,000. Old Ajax will quit business in a hushy way, and will leave a record of faithful and efficient management, of which all Grass Valley is proud."

A short history of the famous property will be interesting. We copy it from "Beans Directory of Nevada." "Eureka hill, through which the Eureka vein runs, is about one mile and one-quarter from Grass Valley. It was originally known as Eureka mountain, the first location being made February 7th, 1851. The Eureka, which, as far as developed, has proved itself the richest gold mine in the world, is among the earliest quartz locations in the township, but its richness, notwithstanding it had been worked by various parties for a number of years, was not fully developed until the winter of 1863. The mine was owned at various times by D. L. Lamarque, Geo. D. Roberts and William Chollar, who failed to find it profitable; Lamarque, who had purchased the interests of the other partners, finally selling the mine in 1857 to Fricot, Ripert & Pralus, for a comparatively small sum. During the years from 1857 to 1863, the ledge was worked to a perpendicular depth of 48 feet, and during this period large quantities of quartz were taken out, none

of which paid largely, while the greater portion of the rock failed to pay crushing expenses. Becoming satisfied at last that the ledge was really a good one, Fricot & Co. commenced sinking a vertical shaft in 1863, completing it to a depth of 100 feet in 1864. The vein at this depth was very large and well defined, showing an excellent quality of quartz. The company in sinking this shaft took out sufficient money to pay the expenses of erecting hoisting works, building the present magnificent mill, all at an expense of over \$60,000, besides giving numerous handsome dividends to the three partners. From 1863, up to the sale of the mine in the fall of 1865, the Eureka continued to pay largely, but the figures we have not been able to obtain."

## Cost of Production at the Mount Diablo Coal Mines.

The only coal field in the State of California which has hitherto been profitably mined, is the Mount Diablo coal field, now, however, nearly worked out. The mines in this field have, according to Mr. Goodyear, in his "Coal mines of the Western Coast," yielded since 1861, a total of 1,875,962 tons of coal, of 2,240 pounds to the ton. These mines are the principal ones in the State, as although it is easy to find coal in many localities on the Coast range, from one end of California to the other, as well as at certain points in the western foothills of the Sierra Nevada, yet it generally happens either that its quality is poor or its quantity small, or else that it is situated in the heart of the mountains, so far from market that the cost of transportation alone would far exceed the value of the coal.

Concerning the cost of production at the Mount Diablo mines, Mr. Goodyear, whose work we noticed last week, has had excellent opportunities of observing, and the following extract will be found of value to those interested in this kind of mining:

"The cost of mining and transporting the Mount Diablo coal has varied very greatly, not only between the different mines, but also at different times and under varying circumstances for the same mine. The differences in this respect have been so great, indeed, that any single statement of the actual cost for any particular mine at any definite time would be of no value whatever as an index of the cost at the same time for a different mine, or for the same mine at a different time. This fact is well illustrated by the history of the Black Diamond Coal Company. At their mines, the monthly averages of the cost per ton for labor alone in mining the coal and putting it into bunkers at the mines, exclusive of the cost of timber and all other supplies, have ranged at different times since 1867 from a minimum of about \$2.37½ to a maximum of very nearly \$4; or say, including supplies, from about \$2.75 to \$4.50, or a little more, per ton. Within the same time, the monthly averages of the cost of the railroad transportation from the mines to the landing have ranged from 25 or 30 cents to over \$1.00 per ton; while the cost also of the water transportation from the landing to San Francisco has varied between 37 cents and \$1.25 per ton.

"But then, again, these three items of cost for mining, for land transportation, and for water transportation, have rarely or never reached either their maxima or their minima values simultaneously, and consequently the actual highest or lowest figures of total cost for mining, transportation and delivery of the Mount Diablo coal at any particular time would not be obtained by adding together separately either the highest or the lowest of the figures given above.

"This total cost, however, has varied at different times since 1866, from a minimum of about \$5.00, or possibly a little less, to a maximum of somewhere between \$6.50 and \$7.00 per ton. But for a general estimate of the total average cost of all the Mount Diablo coal which has ever been sent to market, the sum of \$5.75 per ton may be taken as a fair approximation.

"It may also be stated in this connection, that the average loss of coal in the pillars and in waste of one kind and another in the working of the mines has been, as nearly as it can be estimated, not far from 25 per cent. In other words, only about three-fourths of the coal which the beds contained has been extracted and utilized throughout the whole extent of the works."

**PIOCHE.**—In Salt Lake City, San Francisco district, Leeds, Silver Reef, and all the outside districts, the impression prevails that things have commenced booming in Pioche, similar to the way they did in 1871, and individuals from every direction are making their way to Pioche as fast as possible in all manner of style, the roads leading to that place having plenty of men making the trip afoot. The *Record* cannot say what has given this impression, but it is a very false one, and some will bitterly regret leaving good positions to go there at present. Although the camp is doing very well there is nothing to justify a high rush nor the chance for men to get work by going, so they had better hold off for a while.

The Sulphur Banks quicksilver mine is turning out from 1,000 to 1,100 flasks of quicksilver per month. The company intend refining sulphur again, the demand having increased.

## The Twelfth Industrial Exhibition.

We give herewith an engraving of the medal to be awarded to exhibitors at the coming exhibition. This medal was designed by Messrs. Mayers & Stott, jewelers in this city, and is handsome and appropriate. Trade and commerce, art and science are effectively symbolized on the obverse. A female figure, crowned by accessories indicative of the Golden State, is represented as bestowing a laurel wreath on a kneeling mechanic. Her left arm rests on a shield, bearing the arms of the city, and in her left hand is the caduceus of Mercury. Her head-dress is that of a Bacchante, and at her feet are the offerings of Pomona. A manufactory with smoking chimneys, a locomotive, a Corinthian column, an anvil, an atlas, a plow, a toothed wheel, a sheaf of grain, and a few open books fill up the space around the figures. In the background is the Golden Gate, through which a merchantman, indicative of commerce, is passing. Above is the Star of Empire, and a bear's head is introduced beneath the general design, to typify the State of California. The reverse of the medal contains a wreath with suitable lettering. This medal is very handsome, as any one can see by the engraving, and reflects credit on the taste of the designers. Mr. Stott, an experienced and skillful engraver, is now at work on the die. These medals will be struck off by the designers, and will be in bronze. Probably a few will be made in gold and silver. This medal is probably the largest one ever struck off in the United States, being of the size of our engraving, a little over three inches in diameter.

Active measures are being taken by the Board of Managers to make the Twelfth Industrial Exhibition under the auspices of the Mechanics' Institute, which opens on the 7th of August, a perfect success in every particular. Already more applications for space have been received than ever before at so early a date, showing that the exhibitors are anxious to co-operated heartily with the managers and make the exhibition a success.

The building in which this fair is held is the largest one on the coast, and is the same in which the last one was held. The building is 200 feet wide, 550 feet long, and 100 feet high with a gallery around the inside, beside a promenade sixteen feet wide and 1,000 feet in length, from which an obstructed view of the interior is obtained. In addition to the above space there is an exotic garden, 70 by 200 feet, for the display of the fruits and flowers of the coast—a department which is specially attractive to the ladies, and which is always a specially pleasant feature of these exhibitions. The mechanical annex, for the display of special machinery, is 50 by 200 feet. The main line of shafting is 500 feet in length, with sufficient pulleys for all requirements. This art gallery is 400 feet long and 50 feet wide, well lighted by skylights during the day and by the most improved reflectors at night. This department is also always made very attractive, and forms a complete exhibition by itself. Over 6,000 gas lights are used to illuminate the building during the evening. The musical feature of these exhibitions is excellent, as a grand instrumental concert is given each afternoon and evening by a selected orchestra under the leadership of an experienced director. A large and powerful engine will furnish the motive power for all machinery required to be in motion, while steam and water will be supplied in ample quantities to such machines and appliances as require them.

The importance of these exhibitions to San Francisco and this coast can scarcely be calculated. They arrest the attention of adjacent nations and visitors therefrom and open new avenues of trade and industrial commerce. There can be no better way for a manufacturer to place himself before the public than by means of these exhibitions, as there the buyers have an opportunity to examine in person the articles of manufacture which they are likely to want. Many practical benefits accrue, not only to citizens of this and adjoining States, but to the world of science, industry and art. Every new manufacturing industry established here is of direct value in dollars and cents to the Pacific coast, and these exhibitions give such manufacturers the best possible opportunity to show the people exactly what can be done here and call their attention to the fact that particular articles are manufactured among us. The large and continued attendance at these exhibitions of all classes of our citizens, and the interest manifested in the display, gives the exhibitors assurance of good audiences while the fair is open; and the promptness with which applications for space have come forward show that this important point is duly appreciated by our manufacturers.

Last year no prizes or premiums were awarded to any class of exhibits; this year the managers have concluded to offer a liberal list, for the first order of merit only, on articles in the respective classes. No second-class premiums will be given, and each article must stand on its own merit. It will be understood that while one class may be considered inferior in merit to another class, yet the awards will be for the best in that class to which the article receiving the award belongs. Elaborate experimental tests will be made whenever practicable, and the result embodied in a formal report. In cases where cash constitutes the premium, as in the horticultural department, the awards will vary in accordance with the value of the exhibit.

## Compound Mining Pump.

The engraving on this page shows a compound double plunger pump, devised for mining purposes, now being introduced by Parke & Lacy, 417 Market street, in this city. The peculiarity of this pump consists in the double plunger instead of single, so as to be more in proportion for a large compound steam pump. It is intended for heavy work and will handle very dirty water from mines, being manufactured with this in view. The pump is double acting in each cylinder.

We have described the Walker compound steam pump, but this is a different style from those heretofore mentioned. It is claimed that this pump is very economical and durable, and specially adapted for deep mines. Mr. J. Haug, mechanical engineer, in a recent article in the *Polytechnic Review*, has a detailed comparison

MECHANICS' INSTITUTE MEDAL FOR 1877.

of the results of work accomplished by a 7½-inch single cylinder, and 12-inch compound pump, which is summed up as follows: Steam used in cylinder of compound pump, 420 cubic inches; steam used in valve, 159 cubic inches; total, 479 cubic inches. Steam used in cylinder of single cylinder, 730 cubic inches; steam used in valve, 40 cubic inches; total, 770 inches. The single cylinder pump thus shows an in-

COMPOUND DOUBLE PLUNGER PUMP FOR MINES.

crease of consumption of 770—479=291 cubic inches, or 60.75 per cent. over the compound.

**THE NOBLE MINE.**—From a private letter we obtain the following information concerning the Noble mine, near Sheridan, Montana, some time since mentioned by our correspondent, while traveling in the Territory. They have found the pay shute, and have just commenced running the quartz through the mill. It looks well on the plates. It looks as if the ore would pay from \$40 to \$50 per ton. The ledge is from one and a half to three feet thick. The owners have taken quartz, in which no gold was visible, and pounded it up and obtained 45 cents from less than a pound. The owners think that they have a permanent lead, and a valuable one. Capt. Means's mine, in the same vicinity, is looking well. The last run cleaned up over \$50 per ton.

The Russian government having ordered the purchase of 30,000 horses, Germany will issue a decree prohibiting the export of horses from that empire. It is semi-officially stated that this measure will be solely on the ground of internal economy, and not for political reasons.

## Close Work With Bullion.

It is well understood that in melting and refining gold and silver bullion in the process of coining at the mints, there is usually considerable loss incident to the handling in the different processes. The percentage of loss is pretty well known, and the Government allows a legal limit for such loss. Of course the officials, if honest and capable, can come within this limit, but the closeness with which the work has been done this year at the branch mint in this city, according to a statement furnished by the Government officials, is somewhat remarkable. The figures speak for themselves.

The whole amount of gold bullion delivered to and charged Frank J. Cicott, coiner, during the fiscal year 1876-77 was as follows: Standard ounces, 3,497,968,690; value, \$65,078,487.28. The whole amount returned and credited him during the same period is 3,497,884,595 ounces; value, \$65,076,178.52. Loss, 124,095 ounces;

value, \$2,308.76. Legal limit of loss, 1,748,984 ounces; value, \$32,539.23.

The whole amount of silver bullion delivered to and charged him during the same period is 22,567,231.55 standard ounces; value, \$28,077,426.50. The whole amount returned and credited him during the same period is 22,562,056.21 ounces; value, \$28,070,987.51. Loss, 5,175.34 ounces; value, \$6,438.99. Legal limit of loss 22,567.23 ounces; value, \$28,077.42.

The whole amount of gold bullion delivered to and charged Alex. Martin, melter and refiner, during the fiscal year 1876-77 was 3,618,218,860 standard ounces; value, \$67,315,609.72. The whole amount returned and credited him, during the same period was 3,618,174,718 standard ounces; value, \$67,314,878.47. Loss, 44,142 ounces; value, \$821.25. Legal limit of loss, 3,618,219 ounces; value, \$67,315.70.

The whole amount of silver bullion delivered

to and charged him during the same period as above was 23,635,113.9 standard ounces; value, \$29,407,295.68. The whole amount returned and credited him during the same period was 23,631,673.08 ounces; value, \$29,401,770.55. Loss, 4,440.82 ounces; value, \$3,525.13; Legal limit of loss, 35,454.17 ounces; value, \$44,110.94.

At North Bloomfield three monitor nozzles, each eight inches in diameter, in a single mining claim, throw 30,000,000 gallons of water against gravel cliffs—twice as much water as the whole city of San Francisco uses. The yield of gold for each day is \$1,500, and the labor costs \$140. The gravel is 350 feet deep, and for 340 feet from the surface contains three and one-half cents of gold per ton on an average, and for the 10 feet next the bedrock \$10 per ton.

**SILVER KING** is a newly formed district in Lincoln county, Nev., about 25 miles from Cave valley, in which Ph. Felsenthal, John Hughes, and J. V. Keeley are interested. Ore was brought to Pioche from there and assayed, going \$323.61 per ton.

## Playing Miner with Success.

Gold has been found in the mines by accidents of all kinds, and some curious stories have been told of the trivial occurrences which have led to the discovery of the precious metal. A very curious instance of the kind is told by a correspondent of the *Bedrock Democrat* as having occurred at Auburn, in that State, as follows: Another discovery of vast importance has lately been made by Mr. Wm. Graham. It seems that some weeks ago Mr. Graham concluded to teach his little son habits of industry by inducing him to play minis. He accordingly outfitted him with a pick, pan and shovel, and then very gravely laid off a claim across the street from his store so as to be convenient for observation, then set the little fellow to work, meanwhile instructing him in the most approved methods of mining. The boy worked for a day or two, when his father pronounced the claim fairly opened, and furnished the juvenile miner with a miniature set of sluices and diverted a few inches of waste water into them.

Under these favorable circumstances the boy continued his mining operations for a short time, and finally brought in about 75 cents, worth of gold dust as the result of his first clean-up. This excited the interest of Mr. Graham to such an extent that he volunteered his assistance in working the claim, and the prospects continuing so favorable, he employed men, put on hydraulic and commenced prospecting in earnest. The result of which has been to prove, beyond a doubt, that there is a deep river channel underlying the entire length of the town of Auburn. The gravel is of considerable depth, and yields gold in paying quantities from the top down.

As a matter of course, when this became known all the available ground on this discovery was speedily taken up, which, when properly developed, will afford employment for 100 men or more for the next 10 years.

## Strikes.

Several very rich strikes have been made this summer in the mining counties, where very large amounts of money were taken out in a few days. Although this sounds like the "days of '49" to hear of fortunes being realized in a few days, and does not often happen in the mines now, still occasional strikes are made. The principal ones which have attracted attention are those of "Pike" Bell in Placer county, and Reese, Grant and others in Nevada county. Bell, after being "flat broke" until matters could be no worse, struck out on a prospect and found his fortune. He has taken out upwards of \$30,000 from the little hole he had sunk, and although the prospect might give out any minute, it had not given out at last accounts.

The last strike is that of Reese, Grant & Co., in the "Gongs" mine, Nevada county, where they have taken out over \$10,000 in gold from a little seven-foot shaft. This is also a pocket of course, but how deep a pocket remains to be seen. Usually in such cases the owners are afraid to sink very far for fear the bottom will drop out or the quartz turn poor. These "blow-outs" are few and far between, but when they are found, they are rich enough to make up for their scarcity. The *Foothill Tidings* says the discovery of this mine carries a lesson to prospectors. Within 30 feet of this rich deposit on the same quartz vein, a shaft was sunk some 10 or 12 years ago by J. T. Butler and others and abandoned because no gold was found. Three or four years ago one Muchmore found a piece of "float" rock within six or eight feet of this shute and sunk a small shaft on the ledge. There are several other little holes around there, but none of them evidently found gold on the ledge. Reese, Early and Grant did not sink alone at the spot they found the float, but followed on in the direction the float was likely to come from—up hill—and were rewarded with pay shute which is likely to make the fortune of them all. Mem.—Because one spot on a quartz lode is barren, or a dozen or a hundred spots, it is no sign there is not a bonanza in it. "There is a vein for silver and a place for gold, where they find it."

The blockade of boats on the Chesapeake and Ohio canal has assumed such proportions that on Saturday the Sheriff of Washington county, Md., accompanied by the State Attorney, went to Hancock and broke it up. A blockading squadron, composed of from 30 to 40 boats, was anchored abreast to prevent other boats passing, delaying about 200 boats. The blockade was caused by strikers striving to prevent boats working for less than one dollar per ton for carrying coal from Cumberland to tide water.

**MONTANA MINES.**—Our traveling correspondent, who recently returned from a trip through Idaho, Montana, Nevada, and California, says he found that there were as many mines paying a profit in Montana as in any other region visited. In other localities there were more mines being worked, but in proportion to the number worked, Montana was ahead.

The reduction of interest charge on the public debt since July 1st, 1876, is \$1,943,625, which is the result of the funding operation.

## Pluck Rewarded by Luck.

The Placer Herald has the following account of the way a fortune was made in three days: The richest strike made in this county for many years, and as rich perhaps as was ever made, we have the pleasure of recording. A. O. Bell, commonly called Pike Bell, who with his family has resided for many years on Bald hill, a few miles north of Auburn, as many know, is a dauntless prospector. Though occasionally making a strike of some considerable importance in the past, he has managed, like most modern prospectors, to keep poor. Last winter, in particular, he was in very straitened circumstances; having no money and the merchants refusing to credit him, he offered his horse, worth about \$50, for \$10, that he might buy bread for his children, and failing in his efforts to sacrifice his horse, he pawned the ring off his wife's finger to obtain the necessities of life. Under such circumstances many would have given up prospecting and gone at something that promised more certain results. Not so, however, with Pike. Day by day he continued his researches for the glittering treasure, and whether the passing day had revealed a color or not his spirits were always jubilant, apparently kept up by the hope, that seemed never to desert him, of doing better on the morrow. At last the lucky day came. It was about three weeks ago, when hunting around over the hills, he struck his pick into a little mound which resembled somewhat in appearance an ant-hill, and to his delight he unearthed some pieces of decomposed quartz, attached to which were some colors of gold. Encouraged at this prospect he began to sink on his new lead and was rewarded by finding more or less gold at every stage of descent. Last Saturday he had reached a depth of about 30 feet and had taken out in sinking that far, rock estimated to be worth about \$1,500. The rock being rotten, or what is called by quartz miners decomposed, he had, with little effort, pounded out in a mortar enough to pay expenses as he progressed. The result thus far had been very good, and as the rock had got richer as he got deeper, he was of course entirely pleased at the prospect. Those he had talked to about his mine considered he had a good thing, but none ever dreamed of the great wealth that was in store for him. He had hired men to assist him in working the mine, and on last Monday morning they went to work as usual. The gouge, as we would call it, as it is too rotten to be properly called a ledge, was discovered by noon to have become suddenly richer. In the afternoon chunks of almost pure gold were taken out, and the decomposed stuff that filled the interstices between the rocks was so rich in gold that Pike began to wash it out with a pan. From three pansful washed Monday afternoon, he obtained gold estimated to be worth between \$4,000 and \$5,000. That evening he came into town, and giving us a hint of what he had got, invited us to go out and see it. On Tuesday afternoon, in company with Sheriff McCormick, we visited the mine. We found Bell with a pan of gold in his hands worth from \$1,000 to \$1,500, which he assured us all came from one pan of dirt; "hut," said he, "if you don't believe it, I will wash another pan and show you." We told him to wash. The pan was sent down in the shaft and soon returned filled with a mass of muddy, rocky stuff, that sparkled all over with pieces of gold. This was washed out, and was found to contain fully as much of the precious metal, if not more, than the one he had just finished panning when we arrived. It was really the greatest sight we ever saw, and McCormick, who mined in California in its palmiest days, says it knocked the spots off anything he ever saw, except on one particular occasion. Bell having convinced us of the richness of his mine, took us to his house to show us the proceeds of the previous days' panning, that we might be convinced of all he had told us. The sight was one more easily imagined than described. As we looked upon the pans of gold before us, we thought of Aladdin and his wonderful lamp, and wondered if the story had not been suggested by some such reality as was before us. On Wednesday evening, Mr. Bell (it is "Mr." now since he has lots of gold, it was "Pike" before) was in town again, and he informed us that what we saw was nothing; that he had taken out \$10,000 in three pans that day; that he had taken out, all told up to that time, between \$30,000 and \$35,000, and that he had an offer and was about to sell for \$20,000. When asked his notion for selling, he said he would get away with \$50,000, and that was money enough for him. To be sure, it is a good stake, and when we consider that it was made in three days, it must be confessed that the chances for making a sudden fortune in California are not all gone.

CENTRAL DISTRICT.—There appears to be a chance for Central district to assume the importance among mining camps to which its several veins of rich ore entitles it. S. E. Holcomb of San Francisco has been examining the mines there, and has entered into an agreement with the owners to purchase each and all of them with the exception of the Teamster. The owners are poor men who have been endeavoring to develop them by their own labor, and have no means except the proceeds of a few tons of ore extracted in sinking or drifting. This source of income has been partially if not wholly cut off since the Humboldt reduction works shut down.—Silver State.

## Improved Buddle.

An improved buddle recently invented by Mr. R. H. Williams, M. E., of St. Ansell, is claimed to be the simplest and most effective yet introduced. It is a fixed convex buddle, the improvement consisting in delivering the ore with the water through a revolving tube directly into a small receptacle in the center of the bed, whence it is forced over on to the buddle by the falling water and mineral, the result being an unusually even distribution of the material to be dressed. To fix the buddle a pit is sunk about 3 ft. square, and about the same depth under the intended floor-line of buddle. In the bottom of the pit some 2½ or 3 in. plank is placed. When quite level the foot of the stand is put in position on the plank and spiked down, care of course being taken that it is quite upright. The stand is then built around with masonry to support it and high as the floor line, the arm is screwed up and the center is plumbed to fit the cup. The bottom of the tube is fixed 16 in. above the top of the cup, the cup being nailed down upon a piece of wood exactly underneath the center of the tube, from which the pitch to the stand is taken, and the outer line for the floor is marked. The circumference is struck 6 ft. from the center of the cup. The outside is constructed 12 in. above the floor line, and the bottom is laid in of wood, cement, or any smooth, durable material, Roman cement being that to which preference is given, care being taken to have a perfectly conical bottom, and that the outer part is perfectly level all around. The pitch from the center to the outer extremity of the buddle on a 6-ft. run depends upon the character of the ore treated, and the work to be done. For gold, silver, lead, tin, copper, or other ores whose specific gravity allows of separation by washing, stamped through a 7, 8, or 9 grate, 10½-in. pitch; if through a 10 or 11 grate, 9-in. pitch; and if through a 12 or 13 grate, 7-in. pitch. For slimes, the first operation, a 3-in. pitch is used, and for cleaning, a 4½-in. pitch; some tin slimes require a 6-in. for cleaning. The tube must not be driven faster than 4 revolutions per minute. In the treatment of tin ores, crop tin buddle should have 10-in. pitch; skimmings, coffer, or shaking trunkwork, 9-in. The hoppers or feeders are provided with means of regularly supplying the ore in solution, and also clean water. Mr. Williams states that he is confident as to the simplicity and efficiency of the buddle, the great improvements in it over every other yet introduced being that, as it is supplied with a revolving tube, which regulates the supply of crushed ore, it is quite impossible to admit more water than is necessary to separate the ore, and consequently prevents the ore from being washed back with the tailings. The revolving tube causes the direct fall of the ore to the center of the buddle, forming a self-regulating distribution of the ore all over the conical floor. The ore to be treated being submitted to a clear stream of water, in addition to the water necessary to hold it in solution, the washing is much more effective and the separation at one operation is superior to any process before invented. This buddle is suitable for every department of separating and cleaning finely divided minerals, and is in use for separating gold, tin, lead and other ores. It is simple in construction, cheaply erected, and has no part that can decay, or that cannot in a few hours be replaced if worn or broken by accident.—London Mining Journal.

## Does Mineral King Need a Furnace?

A correspondent of the Visalia Delta says: As there is some talk of endeavoring to secure the erection of another furnace at this place, a few words concerning the demand for it may not be out of place. At present there is not a man, or body of men, in Mineral King, who can truthfully affirm that there is a mine in this whole district. Indications and croppings, and occasionally a six to 12-foot hole, with an assay of picked specimens, is the foundation on which are built the owners' air castles of future wealth and power. For aught anybody knows to the contrary, every ledge may "pinch out" at any depth below 60 feet.

The time when capitalists were willing to assume all risks attendant upon opening, prospecting and working a mine, besides paying the lucky discoverer any price demanded, is passed. Now, if a man is confident he has a good claim, he sinks a shaft to a reasonable depth, and runs a drift each way on the ledge. Then, with this showing, and fair samples of his ore on the dump, he will find little difficulty in disposing of his ore or his mine, or inducing capitalists to erect suitable reduction works. The chances are that there are some good claims here. Until sufficient ore is extracted to keep a furnace going at least two weeks, and to have enough from some claim to determine its manner of working, no serious thought of erecting another furnace ought to be entertained. A reference to the N. E. T. & Co.'s dearly bought experience in handling this ore will be sufficient proof of this. But if a man is willing to kill the 20 days of time required by law to be spent on his claim (and that, too, in working it), or to relocate from year to year, trusting that Providence will send around some one with more money than brains to whom the "honest miner" will transfer his Aladdin's cave in exchange for a round sum in double eagles, his claim will very likely remain unworked for a hundred years to come—and according to one of the "knowing ones" here, at that time they will be thoroughly "ripe."

## DEWEY &amp; CO.

## American &amp; Foreign Patent Agents

OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

## Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

## Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

## Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

## Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## Steam Engines &amp; Boilers.

## NEW AND SECOND-HAND.

- One Patent Straw-Burning, Portable Engine, (new,) fire box boiler, the best Portable Engine on the coast; built by Ransom, Sims & Head, Ipswich, England.
- One Steam Fire Engine, second-hand, in excellent condition, with 200 feet leather hose, very cheap, just the thing for a small town. Button & Blake, builders, Waterford, N. Y.
- One second-hand Stationary Engine, 14x30 inches, link motion, with or without hoist gear.
- One second-hand Stationary Engine, 8x20 inch, with or without hoist gear.
- One Upright Boiler, Horizontal Engine on wheels, Eastern make, 7x12.
- One Upright Boiler, Horizontal Engine, San Francisco make, 6x12.
- One small Stationary Engine, 3½x7 inch.
- One Steam Boiler, 40 inches diameter, 16 feet long.
- One 8x10 Straw-Burning Portable Engine.
- One Traction Engine, three wheels, rubber tires, double cylinder, 6x10 inch; Thompson's patent, D. D. Williamson, builder, New Jersey.
- One Stationary Engine, 10x20, just had a thorough repair, almost as good as new.
- One Stationary Engine, new, 12x24, independent cut-off.
- One 6x12 Engine and Boiler, can be mounted if required. Very cheap.
- Various other second-hand Engines and Boilers for sale cheap.

JOSEPH DIMMICK—Mendocino, Humboldt and Del Norte counties.

C. D. WHITE—San Bernardino and Los Angeles counties.

**SNOOK'S PATENT TANK FILTER.**

It is self-regulating, will last many years without renewing filter material. Is simple, durable, easily cleaned, and not liable to get out of order. A sure preventive against snakes, worms, bugs and all other impurities in the water. It will filter all the water required for any dwelling house, and is not expensive. These filters are expressly designed to use in place of a tank. May be connected to any tank and through the usual pipes supply all the house, or the water may be used direct from the filter, where no tank is required for other purposes. Every house should be provided with one and thus avoid one of the most fruitful sources of disease. Full satisfaction guaranteed and filters kept repair free of expense. For sale by

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarred Manila Rope; Hay Rope; Whale Line, etc., etc.

TUBBS & CO.,

611 and 613 Front Street, San Francisco.

**TOLLES IMPROVED CONCENTRATING TABLES.**

**Improved Concentrating Tables.**

The illustration on this page represents an improvement in concentrating tables for ores recently patented through the Mining and Scientific Press Patent Agency, by J. U. Tolles, of Virginia City, Nevada, who has been using the apparatus very successfully in several places. In the engraving, A represents a flat inclined table provided with a surfacing of cloth or other suitable material of any kind, and with the ledges B, to prevent the material from passing over the ends. B represents a peculiarly constructed feed box extending along the upper edge of the table and provided in its front side with a row of discharge openings, C, of the form shown, each narrowing down to its lower end and of such a size as the nature of the material requires. C represents a receiving box or trough, extending along below the lower edge of the table. D represents a leaf or board hinged to the rear side of the trough or box C, in such a manner that it may be turned under the edge of the table to conduct the valuable material therefrom into the box, the refuse passing over the edge of the table and discharged upon the ground, or into the box in the rear of the box C. E represents a rotating tube or pipe suspended lengthwise above the upper edge of the table by endless belts F, passing over pulleys G, supported in the rigid frame H, or by brackets fastened to the frame and extending out the proper distance over the table, the tube resting and rotating upon them as shown in Fig. 2. The tube is provided from end to end with a row of perforations, and with a hand lever, I, at one end, and is connected by a hose J, to a tank, pump or reservoir, delivering water at a pressure of from eight to 12 feet of head, as the nature of the case requires.

In operating the machine the feed box is narrowed to about one inch at its further end, or has a strip of board set edgewise in the bottom, and running obliquely across the same from the rear to the front side, causing the material to gradually be brought to the front and discharged through the feed holes C, upon the table, thereby insuring an even distribution and steady flow of the material to be treated; a steady and copious supply of water is maintained in the box, and the ore sands or tailings introduced therein. The water escaping through the openings, C, flows down in a thin light stream over the face of the table. The mineral particles are deposited upon and retained by cloth or other surfacing material on the face or bed of the table, while the light refuse matter is carried over the lower edge and discharged outside of the box C. After the collection of a suitable amount of metal upon the

table, the supply of water, etc., to the feed box is stopped by the gate and turned upon the other table. Clear water is now supplied to the first pipe, K, and allowed to run down over the table, (for a moment), washing off the remaining refuse sands, and at the proper time the hinged leaf D, is drawn (by the rod) under the edge of the table, the pipe being rotated or turned and the water thrown through the perforations upon the table in a row of fine jets, forming an almost continuous sheet or film. By means of the lever H, (which should be fastened on the pipe at right angles to the line of perforations), the tube is turned and the sheet of water swept over the table from the top to the bottom so as to drive all adhering particles therefrom and wash them down into the box C. After this operation the jets are stopped from the tube, the leaf

The object in arranging the perforated pipe so that it can rotate is to permit a gradual change in the direction of the jets, so that their point of impact upon the table can be advanced from its upper to its lower edge, and thereby every portion of the surface subjected in turn to the direct impact of the jets, in order to effectually loosen and drive forward the particles therefrom.

The flow of water can be regulated by the valves operated by the cords. The gate shown in the feed trough, G, will throw the water into either feed trough as desired.

thrown back, and the gate shipped to the other feed box, the feed water coming back on the first table, the operation being repeated as often as it is seen the tables are charged with the sulphurets or other valuable metals.

By employing the proper kind of cloth, grooves, riffles, or copper plating, or all of them combined, and giving the tables the proper grade, and properly regulating the flow of water, the inventor finds that he can effect a very rapid and thorough separation without agitating the table, and without power of any kind except the manual labor requisite to change the feed from one table to another, and washing them off by means of the water used in the pipes; he also finds by the employment of the fixed table he can separate particles which cannot be retained in machines which vibrate. By use of the feed openings, C, of the form shown, the discharge of the sand, ore or other fine material is rendered very steady and gradual, as it will be carried through the narrower portion of the openings, while the lighter water will pass over the same through the upper large end of the openings, taking up the material very gradually and distributing it very evenly upon the table. It is obvious that the rotating tube may be sustained in any other manner, and that it may be connected in any suitable manner with the source of the water

The plugs in the ends of the pipes, E, are for the purpose of freeing them of any obstructions.

Fig. 3 represents the most convenient form of erecting the tank or reservoir which supplies the tubes with water, it usually being placed directly overhead with water shed underneath.

Mr. Tolles with this apparatus does not profess to do what many others claim to do, but he is running many of them where everything else has failed. He has been running several of these tables on the Comstock for nearly two years and is now building more. By using the proper kind of sizing apparatus in connection with the tables, the inventor is doing some close work with them at a nominal expense of constructing, running and keeping in order. He states that any person using anything of like nature, or any portion of the same for like purposes, without first obtaining license for so doing, will be prosecuted for damages for such use. Persons at a distance can build and run them by first obtaining license and instructions from the inventor, John U. Tolles, at Eureka, Humboldt county, California, or W. S. Tolles, his authorized agent at Virginia, Nevada.

**The Explorers', Miners' and Metallurgists' Companion.**

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy.

Containing 672 Pages and 83 Engravings  
BY J. S. PHILLIPS, M. E.,  
Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICE—bound in cloth, \$10.50; in leather, \$12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by DEWEY & CO.

**Diamond Drill Co.**

The undersigned, owners of LESCHOTS PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING and TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

**ARITHMETIC MADE EASY.**

ROPP'S

**EASY CALCULATOR**

Is a new publication that must prove of incalculable benefit to Farmers, Mechanics and Business Men. It is so rapid and original as to startle the most scholarly, and yet so simple and practical that the most illiterate in figures can instantaneously become his own accountant. It enables thousands to accomplish in a minute what they could not learn to calculate in many months. The first part contains an entirely new system of tables, which show at a glance the exact value of all kinds of Grain, Stock, Hay, Coal, Lumber, Merchandise, etc., from one pound up to a car load, and for any price that the market is likely to reach; the interest on any sum for any time at 6, 7, 8 and 10 per cent.; correct measurement of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Oranaries, Bins, Wagon Beds, Corn Cribbs; a Time, Wages and many other valuable tables.

The second part is a practical arithmetic, and embodies a simple mechanical principle which enables any one familiar with the fundamental rules to become a lightning calculator, and by which over two-thirds of the figures and labor required by the ordinary methods, and fractions with their intricacies, are entirely avoided.

The work is nicely printed on fine tinted paper, is well and elegantly bound in pocket-book shape and is accompanied by a Silicate Slate, Memorandum and Pocket for papers. It is by far the most complete, comprehensive and convenient pocket manual ever published.

Price, bound in Fins English Cloth, \$1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter, or receipted by express. Address

DEWEY & CO., San Francisco.

SCIENTIFIC PRESS.—As the old year is drawing to a close and the new is rapidly approaching, all our mining friends should subscribe for this scientific journal, especially devoted to their interests. It is a California enterprise, and compares favorably with similar organs of years more experience and age in the old countries.—*Colfax Enterprise.*

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY &amp; CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL, MINING ENGINEER AND METALLURIST.

**Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quicksilver.** 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

**Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams.** 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

## Mining and Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

DEWEY &amp; CO., Publishers, S. F.

"Faith and Confidence."

LIVERMORE, Oct. 1st, 1875.

Messrs. DEWEY & Co., Patent Solicitors: Gentlemen—Yours of the 29th ult., containing my patent to Elevated R. R. duly received, and I hereby return my sincere thanks to the MINING AND SCIENTIFIC PRESS Patent Agency for your promptness and honesty in regard to our business connections. I have received a flood of circulars from Eastern firms, desiring to deal with me, but I have declined any communication with them and prefer as soon as circumstances will permit, to negotiate with and patronize a home institution; one in which I have faith and confidence—DEWEY & Co.

Again thanking you for your promptness in securing my patent, I remain, obediently yours,

WM. H. HARRISON.

Thanks for Prompt Attention.

STOCKTON, June 26th, 1875.

Messrs. DEWEY & Co., S. F.:—

I have received the patent for my invention in wagon brakes, which you procured for me; patented May 11th, 1875, No. 163,046. Thanks to you for your prompt attention to the case; you will hereafter be my attorneys in such cases. I recommend all inventors on the Pacific Coast to give you a call, which I think they will never have any cause to regret. Very truly yours,

OEO. O. BUCKLAND,

## Superior Pianos for the People at Popular Cash Prices.

More than TEN THOUSAND prosperous families on this Coast need Ten Thousand GOLDEN PIANOS to make TEN THOUSAND HOMES MORE PLEASANT AND ATTRACTIVE.

Prices of good Pianos have long been too high. Our people could not afford to buy them. But many will find it not only pleasant but profitable to purchase

## The Brilliant and Durable GOLDEN PIANO

Which we now offer the readers of this paper At Greatly Reduced Popular Cash Prices.

We Guarantee them to be as represented, of superior tone, finish and durability. Samples can be seen by calling at this office. We keep no expensive sales-rooms and attendants.

We shall sell none but superior and desirable instruments, but give our customers the benefit of prices far below any before offered on this side of the Continent.

## Prices of the Golden Piano:

(SQUARE—No. 4.)	

We invite our readers who wish to look at Pianos for themselves or friends, for immediate or future purchase, to call and examine our samples.

Those who cannot call will be given further information by consulting our agents or sending to this office.

## To Mining Secretaries.

An amendment to Section 336 of the California Code, taking effect July 1st, 1874, provides that in addition to the regular publication, daily or weekly, of the assessment and sale notices as heretofore,

## PERSONAL NOTICE

Must be served as provided in the following quotation from the law:

"The notice must be personally served upon each stockholder, or in lieu of personal service, must be sent through the mail, addressed to each stockholder at his place of residence, if known, and if not known, at the place where the principal office of the Corporation is situated."

The above refers to the ASSESSMENT NOTICE only. Advertisers in the MINING AND SCIENTIFIC PRESS will be furnished with copies of assessment notices printed on slips suitable for serving personal notice under this law at short notice.

DEWEY &amp; CO., Publishers.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

**Bella Union Quicksilver Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Napa County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the twenty-eighth day of June, 1877, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 312 Montgomery Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid on the thirtieth day of July, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Saturday, the twenty-fifth day of August, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors, ABRAHAM HALSEY, Sec'y.

**California Fruit Growing Association.**—Principal place of business, San Francisco. Location of property, El Dorado county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the second day of July, 1877, an assessment of \$1.50 per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at 331 Sansome Street, S. F.

Any stock upon which this assessment shall remain unpaid on the sixth day of August, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the thirtieth day of August, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

HORACE JONES, Sec'y.

Office, 331 Sansome Street.

**Consolidated Bonanza Gold and Silver Mining Co.**—Location of principal place of business, San Francisco, California. Location of works in Eagle and Washoe Valley Mining District, Ormsby county, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees, held on the fourth day of July, 1877, an assessment of No. 1, of 10 cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary at the office of the company, No. 13 First Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on Tuesday, the tenth day of July, 1877, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Tuesday, the thirtieth day of July, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees, WM. MARTIN, Secretary.

Office No. 13 First Street, San Francisco, Cal.

**Excelsior Silver Mining Company.**—Location of principal place of business, San Francisco, California. Location of works, Folsom District, Lincoln county, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the twenty-seventh day of June, 1877, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold and silver coin, to the Secretary, at the office of the company, 306 Post Street.

Any stock upon which this assessment shall remain unpaid on the twenty-seventh day of July, 1877, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twentieth day of August, 1877, to pay the delinquent assessment, together with costs of advertising and expense of sale.

W. A. KOLLMYER, Sec'y.

Office, 306 Post Street, San Francisco.

**Mariposa Land and Mining Company of California.**—Location of principal place of business, San Francisco, California. Location of works, Mariposa county, Cal.

Notice is hereby given that at a meeting of the Board of Directors, held on the sixth day of June, 1877, an assessment of No. 11, of \$1.00 per share was levied upon the capital stock of the corporation, payable immediately in United States currency, to the Secretary at the office of the company, room 33 Nevada Block, No. 309 Montgomery Street, San Francisco, California, or to the Assistant Secretary, at the office, No. 9 Nassau street, New York, N. Y.

Any stock upon which this assessment shall remain unpaid on the sixth day of July, 1877, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Wednesday the twenty-fifth day of July, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors, LEANDER LEAVITT, Secretary.

Office, Room 33, Nevada Block, No. 309 Montgomery street San Francisco, Cal.

**Silver Sprout Mining Company.**—Principal place of business, San Francisco, State of California. Location of works, Kearsarge Mining District, Inyo County, State of California.

Notice is hereby given, that at a meeting of the Board of Directors, held on the twenty-third day of May, 1877, an assessment of five cents per share was levied upon the capital stock of the corporation, payable immediately in United States gold coin, to the Secretary at the office of the company in San Francisco.

Any stock upon which this assessment shall remain unpaid on the twenty-fifth day of June, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the sixteenth day of July, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

T. B. WINGARD, Secretary.

Office, Room 20, No. 323 Montgomery Street, San Francisco, Cal.

**POSTPONEMENT.**—The day for deeming Stock delinquent on the above assessment is hereby postponed until Monday, the 23d day of July, 1877, and the sale thereof until Monday, the 16th day of August, 1877. By order of the Board of Trustees, T. B. WINGARD, Sec'y.

**Union Consolidated Silver Mining Company.**—The Annual Meeting of the Stockholders of the above named company, for the election of Trustees, and the transaction of such other business as may be presented, will be held on Monday, July sixteenth, 1877, (third Monday in July), at two o'clock P. M., on that day, at the office of the corporation, Rooms 3 and 4 second floor, 309 California St., over Etna Insurance office, San Francisco, Cal. Transfer books closed on Monday, July 9th, 1877, at three o'clock, P. M.

J. M. BUFFINGTON, Sec'y.

## Iron and Machine Works.

**PACIFIC ROLLING MILL COMPANY,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON

Every Variety of Shafting,

Embracing ALL SIZES of

Steamboat Shafts, Cranks, Pionet and Connecting Rods, Car and Locomotive Axes and Frames,

—ALSO—

Hammered Iron of Every Description and Size.

Orders addressed to PACIFIC ROLLING MILL COMPANY, P. O. Box 2032, San Francisco, Cal., will receive prompt attention. Office: 16 First Street.  
The highest price paid for Scrap Iron.

**THE RISDON**

**Iron and Locomotive Works,**

INCORPORATED.....APRIL 30, 1868  
CAPITAL.....\$1,000,000.

LOCATION OF WORKS:

Corner of Beale and Howard Streets,

SAN FRANCISCO.

Manufacturers of Steam Engines, Quartz and Flour Mill Machinery, Steam Boilers (Marine, Locomotive and Stationary), Marine Engines (High and Low Pressure). All kinds of light and heavy Castings at lowest prices. Cams and Tappets, with chilled faces, guaranteed 40 per cent. more durable than ordinary iron.

Directors:

Joseph Moore, Jesse Holladay, C. E. McLane,  
Wm. Norris, Wm. H. Taylor, J. B. Haggin,  
James D. Walker.

W. M. H. TAYLOR.....President  
JOSEPH MOORE.....Vice-President and Superintendent  
LEWIS R. MEAD.....Secretary

THOS. PENDERGAST. HENRY S. SMITH

**ÆTNA IRON WORKS,**

MANUFACTURERS OF

**IRON CASTINGS**

**and MACHINERY**

OF ALL KINDS.

Fremont Street, Bet. Howard and Folsom

SAN FRANCISCO.

**FULTON**

**FOUNDRY AND IRON WORKS.**

**HINCKLEY & CO.,**

Manufacturers of

**STEAM ENGINES,**

**Quartz, Flour and Saw Mills,**

Hayes' Improved Steam Pump, Brodie's Improved Crueher, Mining Pumps, Amalgamators, and all kinds of Machinery.

N. E. corner of Tehama and Fremont streets, above Howard, San Francisco.

**SHEET IRON PIPE.**

**Risdon Iron and Locomotive Works**

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle and box—introduced by this company, and guaranteed to outlast any other wheels made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

**SACRAMENTO BOILER WORKS,**

37 Fremont St., cor. Mission, S. F.

**HALL & KELSHAW,**

**PRACTICAL BOILER MAKERS,**

Marine, Stationary and Portable Boilers, Smoke Stacks, Hydraulic Pipe, Oil or Water Tanks, Ore and Water Buckets, Gasometers, Girders, Bridges and Iron Ship Building.

**ALL KINDS OF SHEET IRON WORK.**

Repairing promptly attended to at the lowest possible terms.

## PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

**RANKIN, BRAYTON & CO.,**

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY, INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, ETC., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster Rock Drills and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

**IMPROVED PORTABLE**

**Hoisting Engines,**

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery.

## PHELPS MANUFACTURING COMPANY,

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle Work, Car Frames and Bolts, Machine Bolts, Set Screws and Tap Bolts, Lag or Coach Screws.

**ALL STYLES OF FANCY HEAD BOLTS.**

HOT AND COLD PRESSED HEXAGONAL AND SQUARE NUTS, WASHERS, BOLT ENDS, TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,

SAN FRANCISCO, CAL.

**THOMPSON BROTHERS, EUREKA FOUNDRY,**  
Light and Heavy Castings of Every Description Manufactured.

Sole Proprietors and Manufacturers of

Lynch's Ventilating and Illuminating Tile, The Only Illuminating Tile Manufactured for Lighting Cellars, Basements and Dark Rooms which provides proper ventilation for such places.

129 and 131 Beale Street,  
BET. MISSION & HOWARD, SAN FRANCISCO

**CALIFORNIA BRASS FOUNDRY,**

No. 125 First Street, Opposite Minna,

SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE.  
J. H. WEED. V. KINGWELL.

**California Machine Works,**

119 BEALE STREET, SAN FRANCISCO.

**BIRCH, ARGALL & CO.,**

Builders of QUARTZ, SAW AND FLOUR MILLS,

Keating's Sack Printing Pressees,

THE ECONOMY HYDRAULIC HOIST FOR STORES,

And General Machinists.

**STEAM ENGINES AND BOILERS**

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

**BOILER MAKERS AND**

**GENERAL MACHINISTS,**

Howard between Fremont and Beale Sts., San Francisco

**San Francisco Pioneer Screen Works,**

J. W. QUICK, MANUFACTURER,

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOT CUT and SLOT PUNCHED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.  
32 Fremont Street, San Francisco.

## Machinery.

**The Ingersoll Rock Drill**

Is Extensively Used in the East and

**TAKES THE PLACE OF ALL OTHERS,**

Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other Drill in the market. It has but few parts, is easily handled, being light, and has AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

(Room 10.)

320 Saneome Street

**The Gardner Automatic Governor.**

USE.

MORE THAN TEN THOUSAND NOW IN USE. EVERY ONE WARRANTED.

SEND FOR DESCRIPTIVE CIRCULAR AND PRICE LIST.

When all others fail, buy a "Gardner." We have all sizes of these celebrated Steam Governors on hand at all times.

BERRY & PLACE,

Selling Agents for the Pacific States,

Cor. Market & Fremont Sts., S. F.

**THE O'HARRA**

**CHLORIDIZING FURNACE**

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

**Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:**

One man.....	\$ 4 00
One man.....	3 00
Wood—2 1/2 cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2 1/2 cents.....	40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 01 1/2

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in Peavine District, Nev., and at the Eschequer mill, Alpine Co., Cal. For further information, apply to

Will receive a few pupils at his new laboratory, No. 617 Montgomery Street, up-stairs. TERMS MODERATE.

**STRONG & CO.,**

**Assayers and Metallurgists,**

10 STEVENSON STREET, S. F.

**\$1,000 Challenge Ore Feeder,**

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

**REFERENCES.**

A letter received from the Julian Mill, Newcastle, says of the Carrier Feeder: "It is the most perfect Feeder we have ever seen; don't see how any mill can do without them." A letter from Mr. C. C. Belding, of Amador County, speaks in the highest terms of them. Two of the machines were shipped to the Bunker Hill Mill, also Gover Mill, Amador County. Mr. Stevenson, of Boston Mill, Gold Hill, Nevada, says they are the best Feeder he has ever seen. Soulsby Mill, Tirolmine County. California Company, Nevada City. Omaha Gold Mining Company, Grass Valley. St. Patrick Mill, Placer County.

**\$1,000 CHALLENGE.**

Backward in Coming Forward.

C. P. Stanford fails to come to time on the Challenge of \$1,000 to Test the Merits of His Ore Feeder as Against Mine. The Challenge is Still Open to Him or any one else. GENTLEMEN, Put up or Shut up.

A letter has been received from the Crescent mine, Plumas County, in which it states that the Tulloch is a failure as against the \$1,000 Challenge Feeder of Hendy's.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

For Description, Send for Circular to

**J. HENDY, Sole Manufacturer,**

NOS. 49 &amp; 51 FREMONT STREET, - - - SAN FRANCISCO, CAL.

Where it Can be Seen in Operation.

Also, MANUFACTURER OF

50 FINE CARDS, Damask, Repp, Etc., with name on, 13 cents. CLINTON BROS., Clintonville, Conn.

**CAUTION TO HYDRAULIC MINERS.**

All persons, excepting those having the right by purchase from me, are hereby cautioned against using, or making, or selling any device for turning the discharge pipes of hydraulic machines which uses the deflecting force of the stream of water.

Any such device is an infringement of United States Letters Patent, granted to me on the 16th of May, 1876, and re-issued September 10th, 1876.

I have commenced suit against Richard Hoskin for infringing my said patent, and intend to prosecute all parties using such Deflectors without license from me, there being no other way to protect my rights.

Any parties wishing to purchase the right to use this device can do so by making application to me.

**HENRY C. PERKINS,**

North Bloomfield, Nevada County, Cal.

**Newspaper Fileholders.**

Dewey's new elastic fileholders (black walnut), size of the Press, Harper's Weekly and Scientific American, for 50 cents. Larger sizes to suit any newspaper, 75 cents. By mail, postpaid, 10 cents extra. Cash with all orders. Patent allowed. Address, Dewey & Co., Publishers, San Francisco.

**ASBESTOS COATING**

For Steam Boilers, Pipes, etc. Best non-conductor of heat in use. It effects a LARGE SAVING OF FUEL, LASTS AS LONG AS THE IRON to which it is applied, and is reasonable in cost.

**CAST STEEL SHOES AND DIES.**

Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of Iron from which our Steel is manufactured, and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at twelve cents per pound, delivered at San Francisco or Sacramento, instead of sixteen cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc., etc.

Address all orders, with dimensions or drawings, to

## A VALUABLE MINING BOOK.

BY J. S. PHILLIPS.

The Explorers', Miners and Metallurgists' Companion 682 pages, 83 illustrations. Second Edition. A California publication.

### OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and meet the requirements of those for whom it has been written.—*London Mining Journal*.

The most practical and comprehensive work on mining subjects extant, and valuable book of reference.—*Mining and Scientific Press, San Francisco*.

We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—*S. F. Golden Era*.

He has rendered to the leading industry of the coast a valuable service—has furnished the millman and miner a safe and much needed practical guide.—*Overland Monthly*.

This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—*S. F. Commercial Herald*.

This book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—*S. F. Daily Alta*.

In the several sections the work is eminently practical. Is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—*S. F. Daily Examiner*.

It affords a vast quantity of information as to the appearance and value of different ores.—*S. F. News Letter*.

It is the best single English treatise we know of for the use of prospectors and practical miners.—*The Engineering and Mining Journal, New York*.

Sold by Dewey & Co., at this office. Price \$10.50.

## Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, has something to say of superheated steam, preparation of chloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patchen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Kroenke's process, etc. Under "Pulverizing Machines" are described the armstrut and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tallies and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome Street, San Francisco.

NEVADA CITY, June 10, 1877.  
MESSRS. DEWEY & Co.,—Gentlemen:—My letters patent for improvement in horseshoe bars is received. I thank you for the promptness in which you have attended to this case. Whenever I have any business, in connection with your office, I will be pleased to call on you, and recommend my friends to do the same. Yours respectfully,  
A. BARTON.

UNITED STATES  
Mineral Land Laws, Revised Statutes,  
AND INSTRUCTIONS AND FORMS  
UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1863; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Register's Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. ## The National Duplex Air Compressor.

The accompanying engraving represents the duplex air compressor, manufactured by the National Drill and Compressor Company. This compressor has two steam cylinders, 12x42 inches, and two air cylinders, 15x42 inches, being double-acting. The air pistons work within one-sixteenth of an inch of the cylinder heads; the piston and cylinder heads present plain surfaces to each other, so that practically the air is all discharged at each stroke.

The water circulation for cooling passes spirally around the air cylinder from the center to each end, keeping it perfectly cool without mingling the water and air as is done in other compressors. This feature is comparatively new, and is covered by letters patent. In compressing the air in this manner all its expansive force is left, while the mingling of air and water decreases the expansion, it is said, one-third, this being one of the grounds on which the economy of this machine is claimed.

The inlet and outlet valves can be taken out without disturbing any other part of the machine. The agents claim that the machine will compress air to the same pressure as that of steam used; the amount of free air compressed at a piston speed of 250 feet being about 1,000 cubic feet per minute. They get a greater pressure of air than the pressure of steam used, by increasing the size of the steam cylinder or decreasing that of the air cylinder. We are told that at 400 feet of piston speed this machine will give 125-horse power with steam at 90 pounds. The outlet valves have less lap than those heretofore in use, and accordingly do not cause any greater pressure in the cylinder than in the receiver. There is a difference in this respect from other compressors, some of which used 50% additional power to overcome this lap, and others again are compelled to use levers to force the outlet valve off its seat.

The combination of these machines together practically remedies the loss that has attended the building of air compressors and steam engines on separate beds and combined only by the shaft. All strain and pressure is in this way equalized, and the sudden halt and jar so common to compressors is avoided. This machine is simple and is claimed to be able to develop more power in proportion to cost and consumption of fuel than machines of this kind.

That compressed air is destined to play a conspicuous part in the development of the mining resources as well as many branches of mechanics in this country, no one that has given the matter any thought can doubt. The fact that air can be, and is, now carried many miles without appreciable loss, proves that at no distant day some mines that do not now pay for working, on account of the high price of fuel and the slow manner of sinking or drifting, will avail themselves of the advantages and utilize many streams that are running to waste. This company build a compressor that is run by water power, entirely different from anything in use. It is claimed to be of greater capacity than others in the market for the same money. They are prepared to make proposals and set these machines up in any part of the world. The company has recently put up for the Republic Iron Company, at Marquette, Mich., some air compressors at a water power nearly a

mile from their mine. The air in this case is compressed to a pressure of 60 pounds to the square inch by water, and is conveyed to the mine through 5,000 feet of iron pipe, where the large hoisting engines and all the other machinery are run by it instead of steam, as formerly, doing away entirely with the cost of fuel. The rock drill, the companion of this compressor, is made in such a manner that the company say they will guarantee greater durability and more work than any other drill. They ask for trials against other machines. These machines are used by the Republic Iron Company, Lake Superior, the Pennsylvania Railroad Company, the Forest of Dean iron mines, the Idaho mining company, Grass Valley, the Pittsburg mining company and many others. The agents claim that the National Drill is the victor over all other machine drills in the market. Those desiring further particulars concerning this machinery, can address the National Drill and Compressor Company, office at Berry & Place's,

## Quicksilver.

Quicksilver still continues to be quoted at a very low price, with no immediate prospects of any improvement. Although this is a very good thing for miners generally, it is pretty rough on the quicksilver men, who can scarcely make the two ends meet at present prices. A great many mines have closed down because they would not pay to work with quicksilver at 42½ cents. Two years ago, when the quicksilver excitement was at its height, a great many persons located mines and went to work on them, and by the time they were in a shape to be productive and profitable, the price of mercury declined so much that they had to give up. Some of those who invested in mines of this character at the wrong time, expecting that quicksilver would go up instead of down, were sadly disappointed and lost considerable money.

## Mining Patents.

The miners are beginning to find out that when they have a mine that has good prospects it is as cheap to patent it at once as to keep up the necessary annual expenditures. The law provides that certain work shall be done each year on all mines until a patent is allowed; so that when a patent is granted these enforced expenditures cease. The United States patent to the ground gives a clear title, and intending purchasers always feel easier when a mine is patented. In fact, some will not look at a mine with a view to purchase unless it is patented. It is not only a guarantee of title, but to some degree a guarantee that the mine is not a mere prospect. The miners appreciate these facts, and many more patents to mining claims are now being issued than ever before. The latest list is as follows:

California—Nevada County—Pennsylvania quartz lode and placer, to Pennsylvania gold mining company; Republic quartz mine, David W. Schnapp, Sierra County—Ariel and Buttes Union quartz mines, Sierra Buttes company.

Nevada—Eureka County—Silver State and Original Baltic mines, to Gustave Peterson and others; Shoo Fly (Nos. 2 and 3) and Jefferson Lodes, Thos. J. Taylor. White Pine county—Nevada Chief mines and mill-site, Wm. Cray and others; Genesee lode and mill-site, Chas. E. Ramsdell; O. H. Joe mine, Thos. Wren; Mohawk lode and mill-site, John Hammond; North and South John Wild mines and mill-sites, Frank and Olive Drake; Curtis & Keller mine, A. S. Rich; Paymaster, Young America, Defiance and Carolina mill-sites, to Martin White mining company.

Utah—Queen Bees mine, Elisha Freeman; Stella mine, Benjamin Raybold; Little Fred mining and tunnel company, Yopina Extension Northeast mine, Isidor Morris; Galeana mine, S. N.

Osborn; Mary Ellen mine, S. F. Nuckolls and others; Becktel mine, Isaac Rolland.

Arizona—Yavapai county—Thomas mine, E. E. Burlingame and others.

Montana—Bismarck and Von Arnim lodes, Phillip Miller and others; Golden Leaf mine, Phillip Snemman; Trapper mine, Jas. A. Bryant; La Plata mine, John Downs; War Eagle mine, Robert S. Hale; Old Dan Tucker mine, Emanuel Redding and others; Little Emma and Salmon and Cliff Extension mines, Eli D. Holland and others; Hell Gate and Avalanche ditch and placer mine, Wm. O. Warner and others; Atlantic, South Alta, Hecla, Avon and Cleve lodes, Noah Armstrong and others.

At a stockholders' meeting of the North Consolidated Virginia mining company, it was resolved that the Trustees be prohibited from disposing of the 23,125 shares of the delinquent capital stock bought in by the company on June 12th, until authorized by a meeting of the stockholders. They were also prohibited from selling the working capital on hand—7,195 shares.

THE *Inter-Ocean's* Bismarck special says: The steamer *Fletcher* has just arrived from the Little Big Horn, bringing the remains of General Custer and other officers massacred with him on June 25th, 1876. They will be taken to Fort Lincoln for the present.

THE NATIONAL DUPLEX AIR COMPRESSOR.

corner of Market and Fremont streets, in this city.

PRECIOUS DUST.—The dust which has been allowed to accumulate upon the roof of the Philadelphia Mint during the past twenty-five years, was collected recently by order of Governor Pollock, for the purpose of ascertaining what proportion of metal it contained. The roof is of asphalt and as it softens, the dust sticks to it tenaciously. Some amount of difficulty was consequently experienced in removing it. Finally a quantity amounting to 1,732 pounds in weight was removed and this has just been submitted to the usual assaying process, and the result shows that 42 ounces of standard gold and 76½ ounces of standard silver, worth the total valuation of about \$850, has been conveyed in the upward flight of the smoke of the chimney to the place where it became located.

At the mouth of Dutch Bill canyon, on Russian river, Jim English, a veteran redwood chopper, exhibits a redwood tree from which he has taken lumber enough to build his dwelling house, outbuildings, corral, fenced his farm, and besides made 250,000 shingles, 1,000 posts, 6,000 shakes, and there is timber enough remaining in the tree to make 300,000 more shingles. Another tree has been cut in the neighborhood from which 50,000 feet of clear lumber has been made.

In Lake, Napa, Sonoma, Solano, Trinity, San Luis Obispo, and several other counties, the new industry of quicksilver mining was taken up with avidity by a large class of people. Many left their other avocations to engage in this class of mining, which seemed to promise large profits with less risk than is incident to ordinary mining operations. As a matter of course, some of these people made money, while the product was selling at a dollar and a half per pound and lower, but as it gradually fell below the dollar, the mines began to close down, until now there is not one mine at work where there were ten at that time. Even the large mines of course feel the depression, and at the Almaden, the largest mine on the coast, the number of men employed is less than at any time before, and of nine furnaces at its works, only three are in operation.

A large proportion of the smaller mines have closed down altogether, or until such time as the price of quicksilver warrants their resuming operations. As soon, however, as quicksilver shows any tendency to go up, the larger mines can increase their production to keep pace with the demand, and there now seems very little chance of the smaller mines having an opportunity to do much for some time to come. On the 1st of January this year quicksilver was selling at 75 cents per pound, and now it is only about 42 cents, so that even a good many mines that were at work at the beginning of the year have been compelled to discontinue operations.

### Hydrocarbons as Fuel.

There is much to be discussed and ventilated yet as to this substitution of a fuel other than coal for the generation of steam in locomotive or marine engines. The points of advantage to be sought for are not only in economy of coal, but equally in less weight to be carried, and less room required for storage. A patent recently taken out by Mr. Walker, C. E., F. R. G. S., covers an arrangement by which air is converted into hydrocarbon gas of great heating power and is then stored in a chamber subjected to considerable pressure, and is thereby forced out again through a pipe to the perforated tubes from which combustion takes place in the furnace, and by burning hydrocarbons (with the gas) in a gaseous or much divided state, without the adjunct of external heat to gasify or divide them. The heavy oils in this divided or gasified state burn over this grate in conjunction with the hydrocarbon gas.

The principle is thus of extreme simplicity, and the practical arrangements are equally so, insuring a certainty of operation and reducing the question of advisability to one only of cost and convenience. The comparison for storage room and economy will be best made from the following data: that if the calorific power of coal per pound be estimated at 8,000 calorific units, then that of liquid hydrocarbon per pound must be taken at 13,000 units, which gives an advantage, weight for weight, of 62½% in heating power to a liquid hydrocarbon compared with coal. Again, in the combustion of coal, as carried out in the usual construction of our boilers and fire-grates, only a very small proportion of the heat theoretically developed can be made use of, whilst by the use of burning gas and hydrocarbon in a gaseous form close home to the heating surfaces, it seems that a much greater percentage of useful evaporation could be secured. A comparison of useful calorific effect obtained from coal or hydrocarbons has been made to this effect: that in the pound of coal only 50% calorific effect is utilized, or 4,000 units, which is probably much over rather than under the mark, and in the case of the hydrocarbon, 100%, as nearly as possible, or 8,000 units is claimed to be utilized. The comparison, then, of one pound of liquid hydrocarbon being equal in evaporating power to 2.28 pounds of coal, seems fully justified. This will at once effect a large economy in storage room, as less than half the weight of fuel for a given voyage would be required, and probably less than half the space of storage. This would prove very valuable to sea-going steamers, as giving them more valuable freight-carrying room, or capability of running three times a longer voyage without re-coaling. It is probable that the relative cost of fuel would be about the same for both the petroleum and the coal; but the chief gain does not lie in the comparative cost so much as in the convenience and saving of storage room and labor. In the latter item alone a very large proportion of the stokers might be dispensed with, as the gas and oil would be self-supplied by pressure, subject only to regulation by hand as to the amount. Regularity of combustion and the equality of temperature ought to have a beneficial effect upon the plates in preserving them from expansion and contraction, and hence from wear and tear. A valuable point to be noticed in such a gas furnace is the command which can be in the hands of a single individual to at once extinguish or light up, or diminish or increase the fire. There is also great cleanliness about such a system; no smoke, we should suppose, and no cinders or ash to get rid of, and little or no soot.

The combination of burning hydrocarbon gas with the heavy oils, which forms the principal fuel that Mr. Walker proposes to use, would also prove useful on board ship as a means of lighting, and it would also be thus readily put under the control of the captain or other responsible officer. The system advocated by Mr. Walker is to burn both heavy and light hydrocarbon oils. The former is hydrocarbon gas and the latter in atomized form, the atmospheric air passing through them. The gas will vary in its degree of saturation according to the temperature of the liquid. The combination of volatilized petroleum of hydrocarbon with atmospheric air is highly inflammable, and gives off great heat at one degree of saturation, as a comparatively colorless flame, or considerable light at another degree of saturation, and is thus most serviceable either as a source of evaporation or as a lighting medium.

A further very large field for the successful use of this petroleum fuel may be in metallurgical operations, such as the reduction of metals, and particularly in the case of iron smelting. The chemical purity of the gases of combination and the absence of deleterious matters, such as sulphur and phosphorus, will prove valuable in producing the purest and most perfect qualities of wrought iron or steel. The method of mixing a certain proportion of air either in the air-gas or afterwards in the furnace, affords a most convenient means of producing either a reducing or oxidizing flame, as may be desired. This system should also prove very economical in amount of fuel required for reduction, as the waste heat could be so well utilized for heating the air injection.

The mechanical arrangements for carrying out this system are simple. A tube, which supplies the hydrocarbon gas from the tank, is conducted into a series of perforated tubes taking the place of the usual fire-bars. Upon these bars is some-

times laid a layer of asbestos to absorb and render radiant some of the heat, giving an increased economy of about 10%. From these perforated tubes the gas rises in vivid combustion over the fire-bars flame, and passes along the flues as in the case of an ordinary fire.

If we analyze the effect produced by this mode of combustion, we shall find that the heavy oils projected in the form of minute globules into the already hot furnace, present a great surface to the oxidizing effect of the air which surrounds them and which has been their vehicle, therefore they get inflamed instantaneously throughout the mass. The residues of this combustion, which takes place in this divided state, being so minute (one-two hundredth part of each original globule), they are consequently totally carried away by the draft, at the same time the globules or fine spray being on all sides enveloped in air, perfect combustion is attained. —*London Iron.*

### Pittsburg Mine.

This well known property, says the Nevada County Gazette, situated on the hill above Gold flat, last year passed into the hands of some San Francisco capitalists associated with Captain John White, of Empire and Virginia City notoriety, who are developing its hidden treasure to an unlooked for extent. The property consists of 3,000 by 1,500 feet, the vein running southeast and northwest, on which there have been sunk four shafts; two inclines are the working shafts and two perpendiculars are used for air. The present working shaft has a hoisting works erected at its mouth to take the place of the one burned some time since. This building is 40 by 60 feet; has a 16-inch engine, that does the double duty of hoisting and pumping; a pair of hoilers and an air compressor for running drills in the depths below. The mill, situated a short distance south, consists of 10 stamps, a Eureka scourer and a Kittinger rocking buddle for sulphurets, driven by a 12-inch engine. Although the mill is not in first-class shape, the 50 ounces of amalgam that it yields per 24 hours' run makes it a very desirable accession to this valuable property. The incline shaft at the mill is not being worked at present. The mine yields its richest at the 700-foot shaft, on which the new hoisting works are. This shaft has six levels run at right angles from the shaft that was sunk on the vein, which ran at an inclination of about 30° until reaching the 600, where a slide set the vein at nearly a perpendicular and pinched it nearly in two. It was at this point that the former owners became discouraged and gave up working, thinking the prospect did not justify the outlay which would be necessary to again put the mine in good pay, but chose to retire on an ample competency derived from working the mine in its upper levels. The vein here, as in all such formations—crystalline trap—is not extravagantly wide, averaging from 15 inches to three feet, but is much richer and contains more gold than many of much greater width, and with less rock to handle to obtain it. The mill yield is from \$20 to \$60 per ton, including sulphurets, of which there is five per cent. This lower level, the 700, is being run north, carrying the vein with it into the extension, and is rapidly increasing the farther it goes. A winze has been sunk from the 600 to the 700 in ore the entire distance. When the fact is considered that when the present party bought the mine no ore was in sight, the present extraordinary rich developments reflect great credit on Capt. White, the promoter of the enterprise, for his sagacity and good management in putting the mine in its present good pay and at so trifling a cost. The only drawback there is to this mine now, is the shaft ought to be sunk 300 feet, and additional levels run that would enable the mine to run a 20-stamp mill constantly, and this the company will at once proceed to do, and to this end they have bought and have set up and at work an outfit from the National Drill and Compressor Co., a 14-inch air compressor, driven by steam, and two inch drills, with which they propose to sink the shaft. This drilling outfit merits a few words of explanation. The air compressor is the most compact, powerful and durable style known to mechanical science and embodies many new principles; one important one is compressing air without mingling water with it as all others do, and in this way it adds one-third to its expansion and leaves it without an element that not only decreases its usefulness, but takes from the drill a large amount of power, as no drill can do good work while water is passing through it. Aside from this important consideration the cylinders and rings are always cut badly by using water for the purpose of making air, as all others do, thus rendering the piston anything but air tight, which is very desirable in all air compressors. Another feature is, the piston runs within a thirty-second of an inch of the heads, thus expelling all the air and preventing the back pressure as many do. The air making is done by a water jacket pressing entirely around the air cylinder and surrounding the outlet valve with a water bath that effectually prevents them from heating. This compressor is set at the head of the shaft and a two-inch pipe is run down to the bottom with branch pipes to take power off at each level, for the purpose of running drills, engines or pumps. The drills, like the compressors, are a vast improvement on all others, being light, simple and durable, and having but three working pieces there is no breakage, and they are capable of accomplishing more work than any machines

made. A two-inch hole has been drilled in this hard rock six feet in 40 minutes, changing drills twice in the time. Taking all these improvements, with the richness of the ore and the rapid development proposed, the Pittsburg is destined, under its present management, to take rank among the very best mines in the country and will well repay a careful look from all interested in such matters.

### American Locomotives Abroad.

The London Colliery Guardian says: Our American advices informed us last week that 19 locomotives had left the Baldwin locomotive works, Philadelphia, this month, for Brazil. Each engine was accompanied by an engineer and fireman; a number of machinists also went with the engines. We further learn that 22 more engines are to be despatched, in the course of this year, from the Baldwin works to the great South American empire. The Baldwin works have forwarded besides a specimen locomotive to one of the Australian colonies, and the New Zealand government is also about to make a trial of one of the engines of these now celebrated works. Such facts as these show forcibly enough the energy and enterprise with which American firms are endeavoring to find fresh outlets for the products of American industry. Jonathan is rubbing shoulders with John in all the great markets of the world, and unless John bestirs himself he will find Jonathan rather a formidable rival. One circumstance which, perhaps, tells in favor of American locomotive builders in South America, is the disinclination which English capitalists now display—and not unnaturally—to embark their savings in the securities, so called, of South American governments. We call them South American governments partly by habit and partly by courtesy, but what is a South American government only too often? What but a knot of desperate adventurers who have contrived to seize the helm of State for a time, and who hold it until they are shot down or dispersed by a fresh band of lawless conspirators. We have been fleeced too smartly and too recently by such wretched republics as Venezuela, Honduras, Ecuador, Uruguay, Costa Rica and Peru, to be very eager to acquire any more South American bonds. Brazil and Chile certainly maintain a good credit at present, but neither of these States could raise new loans upon the English market so readily or so advantageously as they once did; and the consequence is that American locomotive builders compete with English firms upon rather more equal conditions than formerly. They ought certainly to do so, since they have not to carry their engines so far over the sea. Perhaps one cause which has rendered the Americans more eager competitors against us—not merely in the matter of locomotive building, but in almost every other branch of human effort—is the dullness of trade within the American republic itself. The Americans have been compelled *per force* to seek for fresh fields and pastures new because they have not been doing quite so well at home.

The appearance of American locomotives upon the railways of Australia is perhaps even a still more serious matter to English mechanical concerns than the dispatch of Baldwin engines to Brazil. Hitherto our Australasian friends have naturally almost entirely relied upon us, their kinsmen, for such locomotives as they required. They have certainly made desultory efforts to build locomotives for themselves, but they have not been very successful in doing so, and in the main they have applied to us when they have wanted some of those mighty iron horses which may be said to be the proudest results of British mechanical skill. But now our Australian friends have listened to the blandishments of Jonathan even in the matter of locomotives.

One at least of the Baldwin bogie engines has gone to one of the British settlements in Australia properly so-called, and the New Zealand government is also disposed to give a Baldwin engine a trial. The introduction of American bogie engines upon Australian and New Zealand railways fairly suggests the question whether English mechanical firms are not too rigid and perhaps even too antiquated in their ideas and notions. The bogie locomotive makes little progress upon English railways, but it is just the thing for young colonies and thinly-inhabited countries, in which railways are constructed in a lighter and more make-shift fashion than could possibly be introduced in Great Britain. A bogie engine will run with safety upon a rougher road-bed, and will overcome sharper curves than an engine with an inflexible frame of the ordinary English type. Let any one watch a train rushing along even upon a well appointed English railway, and he will see that it sways more or less about, although in 999 cases out of 1,000 it contrives to keep to the track. Such an observer will be fain to ask himself whether our express trains would not be safer—even when they glide over a first-class permanent way—if they were drawn by bogie locomotives readily adapting themselves to the little obstacles and difficulties of a line? Even if the inflexible framed engine holds its own pretty well upon a permanent way of the excellence of the London and Northwestern, its bogie competitor is far more adapted to a lightly-ballasted Australian road-bed, or to a line which has to climb some of the hills or mountains of New Zealand. When young Australian colonies map out new lines it is of supreme importance that they should be able to construct them cheaply. Sharp curves and

severe gradients have a tendency to reduce construction expenses; the bogie locomotive is at home upon such curves and gradients, and therefore it is just the engine for the antipodes. We may admit this readily enough, because we ought to be able to make bogie locomotives just as easily as they are now made by our American competitors.

### Puddling with Culum.

Experiments are being made at the works of the Towanda Iron Manufacturing Company, at Towanda, Pa., with the culm or dust of the Loyalsock mines. This coal is called semi-anthracite; it looks very much like the bituminous coal in the vicinity of the works, but lacks the bitumin, is remarkably free from sulphur, and contains over 90% of carbon. The first trial made with the culm was under the boilers, and it was quickly demonstrated that more steam could be generated with it than with coarse coal; and not only so, but that it could be done in less time and with a lighter weight of fuel. Experiments were next made in puddling iron. A common double puddling furnace was used, temporary alteration having been made for the purpose. The firebox was lengthened from 12 feet to 21 feet, so as to increase the grate surface, this being necessary from the fact that the fire must be kept very thin—not over three inches; the grates were placed close together, and contained numerous small holes, their diameter being about the eighth of an inch—in a bar three to four inches wide and two and one-half to three feet long, there would be from 400 to 500 of these holes, and there was about two feet of dead surface between the grate and the bridge-wall. These were the only alterations made, the furnace itself not having been changed. The fuel was introduced in the ordinary way, only it was necessary to spread it very evenly over the grate, and a blast was used. The person who is conducting the experiments says he can get up steam and melt iron quicker with this fuel than with any other coal he ever used, and the iron produced is claimed to be of a superior quality, owing to the freedom of the fuel from sulphur. The works are 25 or 30 miles from the mines, but the owners of the latter offer to deliver the culm at a price not to exceed 85 cents per ton. Further experiments are to be made. —*Coal Trade Journal.*

TESTS FOR BEESWAX.—At a recent meeting of a German chemical society, Herr C. Schmidt, after having called the attention of the society to the frequent adulteration of beeswax with resin, described a modification of the so-called Donath's method of detecting the presence of such adulterating compounds, viz: Five grains of the beeswax to be examined is placed in a vessel with five times its bulk of nitric acid (sp. gr. 1.32 to 1.33) and heated to a boiling point, and permitted to remain at this temperature for a moment; an equal volume of cold water and sufficient ammonia to give it a marked ammoniacal odor is then added. If this alkaline solution contains but pure wax, it will be of a yellow color; while if resin be present it will, on account of the nitrogen compounds formed, be of a more or less intense reddish-brown color. Since this test is a colorimetric one, it is well to prepare a solution with chemically pure wax to be kept as a standard.

FATAL FLUME ACCIDENT.—A dispatch from Oroville, dated the 4th inst., says: A section of the flume of the Sugar Pine Lumber Company, at Flee valley, over 200 feet in length and 70 feet high, gave way yesterday, at 3 P. M., under the pressure of a jam of lumber, which clogged and stopped in running. Before it fell, four white men, named Richard Watson, Patrick Bacon, Charles Campbell and Stevens, and a Chinaman, came down from the mill a short distance above to relieve the jam, and while at work at this dizzy height the flume supports gave way. Watson and Bacon jumped from the flume, and falling under it, were instantly crushed to death by the falling timbers. Campbell and Stevens clung to the falling boxes, and though very seriously injured it is thought they will recover. The Chinaman, being near one end of the break, succeeded in reaching a box that did not fall.

GOLD IN AUSTRALIA.—Up to the end of March the exports of bar gold from Victoria amounted to 93,577 ounces, which is over 45 per cent. less than in the corresponding period last year, when the total was 178,738 ounces. The government has dispatched prospecting parties to various parts of the country to endeavor to discover new auriferous reefs, and the Melbourne Argus states that reports have been received from some of them; but, judging from the nature of the information afforded, it does not appear that much good has yet been attained. The same paper also publishes statistics which show on December 31st last, there were in the colony 41,010 miners, of whom 26,553 worked alluvially and 14,452 quartz miners. The deepest shaft yet sunk is 1,930 feet, and the approximate value of the mining plant is nearly two millions.

USING SPARKS.—Mr. James A. Pea, an engineer on the Montgomery and Eufula railroad, has invented a spark arrester by which, it is claimed, not only is the escape of sparks prevented, but the sparks are collected in a box by means of small pipes, and can be used to sand the track or for ballast.

## MECHANICAL PROGRESS.

## Steel Locomotive Boilers.

One of the topics under consideration at the late meeting of railway master mechanics, at Cleveland, was the relative quality of iron and steel as material for railroad boilers. The testimony was almost unswerving in favor of steel as the best material for the shell of the boiler. We quote from a report of a committee as follows: With two exceptions all express themselves decidedly in favor of steel for the shell of the boiler. It is superior to iron in strength, and less difficult to shape and put together, and seems to be in every way preferable. Those who have used it most extensively for this purpose are the most decided in preferring it.

Not a single instance is reported where steel in the shell of a boiler has ruptured when cold, or in heating up, or from putting cold water in the boiler while hot, as so frequently occurs in the case of the sheets of the fire-box. Mr. Sedgley, of the Lake Shore and Michigan Southern, reports one steel sheet in the shell of the boiler to have cracked or broken in the way common to iron sheets in such cases, caused by imperfect construction or form of the boiler. Mr. Howard Fry, of the Philadelphia and Erie road, reports five steel sheets in the shell of boilers on that road to have cracked during the year 1876, but that in every case it was believed to be the result of bad workmanship or bad design in the form and bracing of the boiler, and not from the quality of the steel.

Your committee believe that the material in the shell of the boilers should be heavier than that in general use; that a greater stiffness and surplus of strength would add greatly to the length of time that they can ordinarily be used with safety, and lessen the cost of keeping them in repair from year to year. As the elastic limit of steel such as used in boilers is not much, if any, above that of iron, the same thickness of steel should be adopted as in the case of iron, notwithstanding its superior toughness. It is important that boilers should be so formed and stayed that with the highest pressure carried no part of one will change its original shape in the least by reason of the pressure. A change in shape in one direction by pressure, and returning again to its original position when the pressure is released, will sooner or later result in a crack. The same is true when braces are attached in such a way that the sheet is drawn from its true position by the strains from the brace. In designing and constructing boilers, these matters should always receive the most careful attention.

Those who have had much experience, and have given the matter close attention, give it as their opinion that steel, being more compact than iron, is less liable to waste away from corrosion, and in that respect is to be preferred. From the expressions made to your committee, we find that steel is rapidly taking the place of iron for the shell of the boiler.

## The Protection of Cars Against Lightning.

The following is from Spang's "Practical Treatise on Lightning Protection," a work recently published by Claxton, Remsen & Haffelfinger, of Philadelphia: A locomotive, with its escaping smoke and steam, moving or at rest, in a thunderstorm, will also invite a lightning discharge, and the liability of damage thereto depends upon the quantity of water that has fallen previous to the discharge, the electrical connection made by the rails with the road-bed, the conducting nature of the road-bed and the earth beneath it; also whether iron cars are in the train. When a number of iron cars, like those used in the transportation of petroleum, are in a railway train, a lightning discharge will be diffused over them and greatly weakened, and thereby lessen the liability of damage to, or ignition of, the contents thereof. But in the case of a wooden car, the discharge will invariably pass through its interior and over inmates or contents in order to reach the earth, the contents being generally a path of much better conductivity than the wooden body of the car. The liability of injury or death of passengers and live-stock, and the ignition of powder or other combustible material by lightning can be greatly lessened by providing two metallic paths (one near each end) between the metal roof and the pedestals, axles and wheels of each wooden car used for their transportation. This can be done at a small expense by applying flat iron bars, two inches wide and one-eighth of an inch thick or four inches wide and one-sixteenth of an inch thick, along one of the sides and bottom of the body of the car, and connecting them with the metal roof and center plates attached to the body, and also metallically connecting the center plates of the trucks with the nearest or most convenient metal rod or bar communicating with the pedestals, thereby forming continuous metallic paths from the metal roof to the center plates, thence to the pedestals, axles, wheels and rails to the earth. During the summer season the rails of a railway track do not constitute very good earth terminals for a lightning conductor, owing to the dry condition and poor conductivity of the road-bed, which generally consists of broken stone or furnace cinder,

a foot or more in depth, and their capacity for diffusing a lightning discharge will depend principally upon the quantity of rain that has fallen previous to the discharge and the conductivity of the road-bed and the earth beneath.

**OLD RAILS FOR NAIL MANUFACTURE.**—A manufacturer at Wheeling, West Virginia, is reported to be making a good quality of nails from old rails. Samples were some few days since shown at the office of the *Wheeling Intelligencer*, part of which were made out of rails, pure and simple, and part out of three parts rails and one part muck. They are pronounced good and are smooth and tough and drive well. This process of making nails, we learn, avoids the process of boiling iron. The rails are cut and piled for the heating furnaces, like so much muck bar, and by the use of a flux in the heating process, are welded and made as malleable, ductile and close-textured in the sheet rolls as so much piled muck. Nail plate is thus made \$5.25 per ton cheaper than out of pig iron which has first been made into muck bar. This saving, says the *Intelligencer*, is of itself a big profit, and will, if successful, revolutionize the old method. No mill can afford to puddle iron when by using this flux, old rails or pig iron can be converted directly into nail plate. The same paper says, also: "We lately mentioned that Colonel Powell is making nails at the Belleville mill out of the old rails and one-eighth muck iron, and that he claims to have an advantage equal to \$13 per ton for pig metal. If this turns out to be the case, the furnaces will not have much to do for some time to come, inasmuch as it is estimated that there are enough old rails in the country to run all the mills for several years."

**RUSSIAN SHIP RAISING.**—At the Russian-American india-rubber factory in St. Petersburg, Russia, a specialty is made of the manufacture of air bags for raising sunken vessels. These bags are generally of a cylindrical form with rounded extremities, about 18 feet in length, 11 feet in diameter, with a capacity of some 600 cubic feet, and each bag can, it is calculated, raise a weight of 60 tons, although they are only guaranteed to lift 50. The bags are made of three thicknesses of coarse canvas, thoroughly impregnated and saturated with india-rubber, and having also layers of the latter material interposed. The valves, etc., are of copper, and the bag is protected by a coarse net, its weight when fully furnished being very nearly 1,000 pounds. Without valves, cordage, chains for attaching it to the object to be raised, such a bag costs about \$1,750, but when provided with all these appliances its price is raised to \$2,720. Last year various experiments were made at Portsmouth, England, with these air bags, which were presented to the English Admiralty by the Russian government, and the *Oberon* was, after one or two attempts, successfully floated by means of them.

**A RAILWAY PILE-DRIVER.**—A pile driver in use in Nebraska is thus described: The engine, hammers, derrick, ladders, etc., and hoisting apparatus are all confined within an ordinary sized freight car. Heavy timber and beams make a strong frame-work for the foundation of the bed of the car. It is built on a circular turntable which is worked on the car, and it can be turned either way, the pile-driver reaching out 20 feet beyond the width of the track. Piling for bridges can be driven on end or side of the track simply by shifting the box of the car around. The machinery is placed within in the most compact and convenient form possible, and embraces all the modern improvements in the latest improved pile-drivers. It works with unusual rapidity, and it is but the work of a moment to attach it to an engine or train.

**IRON SHIP-BUILDING IN THE UNITED STATES.**—According to a statement recently placed at the disposal of the New York *Tribune* by the Register of the Treasury, there have been built in the United States, since 1866, for American owners, 251 iron vessels of all sizes, having a total measurement of 197,500 tons. About 150 were vessels of good size. They rank as follows: Less than 100 tons, 57; from 100 to 500 tons, 73; from 500 to 1,000 tons, 41; from 1,000 to 2,000 tons, 61; from 2,000 to 3,000 tons, 9; from 3,000 to 4,000 tons, 8; over 5,000 tons, 2; total 251.

**SMOKELESS FURNACE.**—We learn from an English exchange that Erskine's patent smokeless furnace is an invention, the novelty of which consists of peculiarly constructed fire-bars, resting directly upon tubes arranged in such a manner that heated air is admitted into the furnace in such proportions as to secure combustion of the gases before the smoke is actually made; it is so arranged that the air passing under the fire, and returning through the tubes, is so greatly heated as to generate steam quickly and give a steadier supply. The bars also afford more air space, which is said to secure entire consumption of the fuel, and to greatly economize the same.

**REDUCING THE PRODUCTION OF TIN PLATE.**—We read in the *Colliery Guardian* that the owners of upwards of 100 mills have been prevailed upon to reduce the make of boxes, the Association of Masters having agreed to close their works one week in every three weeks till the end of the present year, a document having been signed to that effect. A fine of £500 will be enforced against any parties who may violate the conditions of the agreement.

## SCIENTIFIC PROGRESS.

## The Shell Mounds.

Various theories have been suggested to furnish a key to the design and motive which led to the building of the shell mounds which are abundant on this coast. The latest *raison d'être* is described by Mr. C. Mason Kinne, Secretary of the San Francisco Microscopical Society, who has given much thought and inquiry to the subject. He writes: A vast deal of theorizing has been entered into for years past regarding these shell-mounds; as to how they were built, for what purpose and by whom. The last is by common consent conceded to the aboriginal races of red men, and perhaps the process and purpose can be made clear by observing what is going on to-day among the tribes of Indians in the Northwestern country and along Puget sound.

I have given the matter some attention and, whenever opportunity has permitted, have made inquiries regarding the habits of the existing aborigines. From reliable parties long resident in that neighborhood, notably of whom is Mr. Edward Miller, a gentleman who is a close observer of nature, I learn that it is the custom of the native dwellers of the forest to pitch their wigwams, built in the shape of a wooden structure some hundreds of feet in length and proportionately wide, formed of shakes or slabs 30 feet long, three to four inches wide and about two inches thick, which they split out of trees straight grained and clean riven—near to some spot where they find a bed of shell-fish and other conveniences. Sometimes as many as 100 occupants live in a single wigwam, which is divided into stalls or small rooms. Here they live year after year, throwing out of the doors and openings for windows their refuse in the shape of fish-bones, stones for heating water and the shells of clams, mussels and oysters. When the heap outside becomes so great that a rampart, so to speak, is formed about them that becomes troublesome to surmount, they level off a spot and move their dwelling, filling up the depression with the same debris, and so go on, year after year. When a chief dies, they bury him in the mound, which is at once a monument to their appetites and his sepulcher, and migrate to a spot miles away and do not return for 10 years. When other members of the chief's family die, they are sometimes buried with them. The chief usually lives to a ripe old age, which accounts for the fact that the teeth are most always found worn down to the gums. A skeleton recently unearthed from a mound near a new mill at West Berkeley, by Mr. Schnsler, was provided with a large jaw-bone and teeth worn down in a similar manner to the one taken from the mound near Fillmore street, and now in the *Alta* office in San Francisco.

The supposition that these mounds were raised for some religious rites or purposes seems hardly tenable, reasoning from the fact of the known laziness of the primeval man, and the theory that the shells were brought from a great distance to where we now find the mounds is not necessary to account for their inland position any more than it would be to claim that the round boulders and sedimentary deposits of lakes and oceans which have long since sought other levels from the upheavals of their beds, were carted to their present geological position by some Titanic nation of the past.

These shell-mounds cannot rank in interest with the artificial elevations of earth of the mound-builders of the West, which, no doubt, were built for a purpose, and are not the refuse heaps of people whose only aim is to get along with as little exertion of mind or body as is consistent with the aphorism that they live to eat and eat to live.

## The Analysis of the Diamond.

Lavoisier, the great French chemist, undertook the examination of the diamond (Prof. Roscoe remarks), and it is worth while noticing how carefully he went to work—how he proceeded slowly from one step to another in the logical sequence until he arrived at the true solution of the question which he had undertaken to investigate—that is, until he was able to tell exactly what happens when the diamond evaporates in the fire, and why it did not do so when surrounded with charcoal. In the first place, he evaporated the diamond by means of the burning-glass, and he observed that no visible vapor or smoke was given off, but that the diamond disappeared. He thought that perhaps the solid diamond had in some way been dissolved by the water, and that by evaporating the water which was in the lower part of the bell-jar in which he burnt the diamond he might obtain the constituents of the diamond, in a solid form; but he found that no solid residue was left on evaporation, and thus no trace of the diamond could be found. His next experiment was that of placing a diamond in a focus of a less powerful lens than the one he had formerly used, so that the diamond was not heated to so high a temperature as before, again placing it however, in a bell-jar over water. He then

found that the diamond, when not heated quite so strongly, lost only about one-quarter of its weight; it did not disappear altogether, but the remarkable fact was noticed that it became covered with a black substance, which Lavoisier describes as being exactly like lampblack or soot, so that it dirtied his fingers when touched, and made a black mark upon paper. Hence he concluded that the diamond is susceptible of being brought, under certain circumstances, into the condition of charcoal, so that it really belongs to the class of combustible bodies. He was, however, yet far from having proved this point, and he went on experimenting. He next measured the volume of air in which he was going to burn the diamond, and found it about eight cubic inches. Then he burned the diamond in this volume of air by means of a lens, and found that the air had diminished to a volume of six cubic inches, thus showing that the air had undergone some change by the combustion of the diamond, and that two out of eight volumes of air had disappeared. The next experiment he made was to examine the condition of the air in which the diamond had been evaporated. What changes had gone on in the air in consequence of the evaporation of the diamond? After allowing the glass in which he had burned the diamond to stand for four days, he poured clear lime-water into the jar in which the diamond had been evaporated, and he says this lime-water was at once precipitated, in the same manner as if it had been brought into contact with gas evolved into effervescence and fermentation, or that given off in cases of metallic reduction. Here, then, he had got on the track of what he wanted. Hitherto the diamond had apparently disappeared, and nothing was found to account for its disappearance; but now he had found that there was something contained in the air in which the diamond was burned which was not contained in the air before. The next step he took was to examine the white precipitate or powder which formed, and he found that the substance thus precipitated from lime-water by the air in which the diamond had been evaporated effervesced on treatment with acid, and evolved what was then known as fixed air, but which we now know as carbonic acid gas. Here, then, in his last experiment, he completes his proof, showing that exactly the same effects are observed when charcoal is experimented upon instead of diamond. Lavoisier had now run his quarry to earth; he had determined exactly what it is that is formed when a diamond is burned. He has shown that a diamond, when burned, produces exactly the same substance that is produced when common charcoal is burned, and he, therefore, legitimately concludes that the diamond is only another form of the element carbon. The reason that the diamond did not burn in the furnace when surrounded by a mass of charcoal was that the air, or rather the oxygen of the air, could not get to the diamond, because it was kept off by the charcoal, which burned instead of the diamond.

**ELECTRIC PLANT.**—The *Gazette Horticole de Nice* publishes some information respecting a plant of the family of *phytolaccas*, which grows in that country and which possesses electro-magnetic properties. When a branch is cut off, the hand holding it experiences an electric sensation similar to that from a Ruhmkorff battery, and the electrical influence of the plant has been observed several paces from the plant by the deviation of the needle of a small compass. When the compass was placed by the experimenter close to the plants, the needle turned completely round. The soil is said by the *Moniteur Industriel* to contain no trace of iron or other magnetic metal, so that the property is inherent in the plant itself. The intensity of the phenomenon varies with the hour of the day—at night it is almost nil, and most intense during the two midday hours or in a wind; during rain it was weak. No birds or insects have been seen to rest upon the *Phytolacca electrica*.

**CURIOS PHENOMENON OF HEAT.**—M. J. Olivier reports the following experiment: A square bar of steel, about 15 millimeters thick, and about 70 to 80 mm. long, is grasped firmly by the operator, one hand being placed at the center of the bar and the other at the end. The free extremity is pressed strongly against a rapidly revolving emery wheel. In a few minutes the rubbed extremity becomes hot, the hand at the center of the bar feels no heat, but the hand at the remote extremity becomes so hot that the operator is obliged to loosen it.

**WEATHER AND MAGNETISM.**—Father Secchi, writing to a friend in Belgium, alludes in striking terms to the remarkable connection between the magnetism of the earth and the changes of the weather. He says that the variations shown by the magnetic instruments are themselves sufficient to indicate the state of the sky. Even where there is no great movement of the barometer, following such magnetic disturbances, there are, especially in summer, changes of the wind and sometimes storms.

**DISCOVERY OF NATIVE MERCURY.**—M. Leymerie, in the *Chemical News*, writes: In the Domaine du Cros, situated in a glen opening directly into the valley of the Herault, the decayed roots of a mulberry tree were being dug up. On breaking one of them there issued from it a wave of mercury. The country people are of opinion that the death of certain mulberry trees is due to the action of mercury. The soil is of a schistous nature.

# MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

### ALPINE.

**CONTRACT LET.**—Alpine *Chronicle*, July 7: Superintendent Dennis has let a contract to Oliver Anderson, Thomas Carlson and John Rowick to run the Illinois-California tunnel 100 feet further at \$15 per foot. We are glad that work on this claim has been resumed under very favorable auspices.

**SILVER CREEK.**—The tunnel of this mine is 110 feet.

### AMADOR.

**POTOM.**—Amador *Ledger*, July 7: Operations have been commenced in dead earnest upon this mine, under the able superintendence of John Trelogan. Eight men are employed and everything wears an encouraging aspect. Indeed, the management have such confidence in the resources of this claim, that a contract has been let for the erection of a 10-stamp mill, a *fac simile* of the one now in operation at the Tallman.

**FUTURE.**—The taking out of ore is suspended for the season, until water again becomes abundant. Sinking is now the order of the day. The mill is still running, and the quantity of rock on the dump is sufficient to keep the mill running for a week or two more.

### CONTRA COSTA.

**PROGRESSING.**—Antioch *Ledger*, July 7: Work is progressing on the Empire coal railroad. Section contracts have been awarded to Tregallas, Fitzjohn and Flynn, who are each working a force of men and teams grading the road bed. Teague & Co., tunnel contractors, have penetrated the hill 600 feet and will make an opening through by the middle of this month. At the mine, work continues without interruption. A drain, 300 feet in length, is being cut, which will save lifting the water 50 feet; it will also make a saving in the amount of fuel consumed. Work upon the wharf at the foot of Kinball street has commenced, and the whole will be completed in a few months.

### FRESNO.

**QUARTZ.**—Fresno *Expositor*, July 4: Near Big Dry creek, in the foothills, southeast from Wm. Cole's place, is a spot through which a number of quartz veins permeate. The first of these veins was discovered a number of years ago, but it remained almost wholly unprospected until a portion of it, comprising what is known as the Champion quartz mine, passed into the control of F. Jensen. After spending a sufficient sum in prospecting to convince Mr. Jensen that the mine was valuable, he erected with his partner, R. M. Keyes, a small five-stamp mill. Ore from the mine crushed in the mill has yielded gold in paying quantities. These gentlemen have been engaged in sinking the vein for the purpose of working it more profitably. Mr. Lytton and others owning on another vein near by have also been sinking. They are down on the vein about 50 feet, and we learn at the bottom of the shaft the vein is two feet in width and well defined. They lately made a crushing of ore at the Champion mill, with results of the most flattering kind. The average of the rock yields about \$20 per ton in free gold. Other mines in the vicinity have had rock crushed at the Champion mill, with equally satisfactory results. From what we can learn it is evident that the mines in this neighborhood will at no distant day be worked with profit. The present great want seems to be sufficient capital to develop the mines.

### NEVADA.

**A RICH STRIKE.**—Nevada *Gazette*, July 7: We yesterday visited the ledge known as the Live Yankee, on the Half-Mile House road, and about half a mile south of the Smith ledge. It is a new discovery, but it is about the richest thing lately found in this vicinity. It is owned by R. E. Robinson, Charles Beale, James Beckwith and Daniel Holmes. The company have been prospecting at that point for some time. There is a ravine heading at a point where work has been done. The ravine below has been worked off and paid splendidly. These gentlemen concluded that the gold in the ravine must have come from a quartz vein, and so have been hunting for it. About two weeks ago they commenced a shaft and after sinking 25 feet they encountered a vein of ore 40 feet before striking anything. On Tuesday evening they struck the ledge and from five pans of dirt washed out \$26 worth of gold. The formation varies from one to four feet in width. The upper and lower portion is composed of sulphureted rock, and between these there is a body of decomposed sulphurets and yellow ochre in which is found the gold. We saw one pan worth of ore, and in which we should judge was \$5 in gold. A horn full was washed from which at least \$10 was taken. The company have out about seven tons of ore and will soon have it crushed. They have certainly struck a rich thing and are deserving of their success.

**THE PROVIDENCE.**—On the 8th level of the Providence mine a cross-cut has been run 140 feet in ledge matter, and from the heading a drift has been run to the level, any heretofore taken out. On the 600-ft level, south of the shaft 500 feet, some splendid ore is being taken. The incline is being sunk from the 8th level 100 feet lower, so as to open a new level. The rock coming from that shaft continues to improve as they go down. In short, the mine never looked as well as it does to-day.

**THE WYOMING.**—Work has been temporarily suspended in the Wyoming ledge, but a tunnel is being run to tap the Wyoming ledge.

**THE NEW ENGLAND.**—The hoisting machinery and mill of the Gold Run mining company has been purchased by the New England company, and will be in place ready for operation in a few days. It will be placed on the west side of the Grass Valley road, opposite the present hoisting works, on the croppings of the ledge. The incline will be completed ready to put down the pump this week. The rock in this mine continues to look well, and when the new works are in operation big returns may be expected.

**NEVADA MINE.**—The Superintendent of the Nevada—better known as the Soggs mine—has purchased the engines and machinery of the old Union mine, near Banner hill, and will go to work at once to have it removed and put in place at the Nevada. There are two powerful engines. One of them will be connected with the mill for crushing when water is scarce. This improvement will allow the Superintendent to thoroughly open the mine and prove what everybody knows—that it is one of the best in the district. The Providence is the south extension of the Nevada, and there is no reason to doubt that the latter is as reliable as the first.

**GRAVEL MINE.**—Dutch Flat *Forum*, July 5: The Rhode Island company continues to clean bedrock. Work in the Wide West mine is being prosecuted to good advantage with a large force of men. The gravel taken from the main tunnel and the side drifts continues to be very rich.

**LOWELL HILL MINES.**—The Swamp Angel company made a clean-up last Saturday, which turned out to be the richest made during the season, the result being the payment of another dividend. The bedrock tunnel in the Planet is being advanced at the rate of five and a half feet per day. The East New York tunnel is in a distance of 300 feet, and although somewhat wet overhead, good progress is being made in advancing it. The tunnel in the Wild Cat mine has reached a distance of over 900 feet.

**LOWELL HILL MINES.**—The Liberty Hill company turned off last week and made a general clean-up for the season, with very encouraging results.

**GEORGE SMITH'S MINE.**—Nevada *Transcript*, July 5: Active work was commenced on this mine about six months ago, and to-day it promises to be one of the best mines in this part of the State. The company worked under great disadvantages for many months, the ground

being soft and treacherous. During that time a cave occurred, and it cost \$2,500 to repair the damages, but now they have the whole mine timbered with the heaviest kind of lumber. They are down 150 feet, running a level at each 50 feet. On the first level the ledge is about six or seven inches thick, and is charged with free gold and very rich silver. From this level they have taken out some of it as specimens, and it is worth fully \$1,000. On the second level the ledge has increased in thickness, and the rock is richer than they found on the first level. On Sunday morning they struck it on the third level, and the ledge is about two feet thick, and, in the place of the other, the rock is filled with live sulphurets, and, in fact, on this level the rock will pay more money to the ton than they found on the first level. Work will be continued as fast as possible in order to run another level, when work of the most extensive character will be carried on. Yesterday morning they commenced stoping, and will take out about 150 tons of rock before a crushing is had. As soon as the other level is completed, the company expect to have sufficient backs for six months' work, without further sinking. The first lot of rock crushed yielded \$10 per ton, the second, \$22, and those who have seen that already in sight, declare it will go in the neighborhood of \$50 per ton. Old miners of the county, who are employed at this mine, and who have worked in most of the others, say it is one of the best prospects they have seen in Nevada county. The company are now employing about 25 men, and within 30 days expect to give employment to 50 more. No believe there are any number of good quartz ledges in this vicinity equal to the Providence, Geo. Smith's and others, and if the same amount of work was done upon them as has been done upon these, the fact would be demonstrated.

### PLACER.

**MINING ITEMS.**—Dutch Flat *Forum*, July 5: Our washing season is gradually drawing to a close, only a few claims having sufficient water to continue operations. The Star & Union claim has ceased washing for the season and is cleaning bedrock. The Baker partially cleaned up the last instant, and resumed washing this morning. Fowler drifts extends back 100 feet beyond the Franklin, and is awaiting the arrival of the 12,000 pounds of Judson powder, which is to be used in the blast. This claim is now working in solid gravel, and we are informed the product of the last run was very satisfactory, showing a marked improvement over the drifted ground, notwithstanding the very bottom could not be reached by the pipes, owing to the unevenness of the surface of the bedrock. We have heard of a large bed of gravel, and are pleased to learn that they are beginning to be confirmed. We feel confident that when the pit extends back to the soft gravel it will pay enormously. The exceeding hard cement lying on the front rim has retarded its opening, but that will soon be past. This claim will probably wash till about the middle of August, after which it will take about a month to clean the bedrock which has been exposed. The Franklin claim is extending its bedrock tunnel, with branches, so as to reach the face of its bank of gravel. This will greatly add to the convenience of washing. The Polar Star exploded a blast of 500 kegs of powder last week, which shook up and crumbled a large area of its bank of gravel. The claim is washing again very successfully. The Southern Cross also exploded a blast of about 500 kegs of powder last week, which loosened up an enormous quantity of gravel. These claims are supplied with water from the South Yuba ditch, and will probably continue washing about two months longer. At Gold Run everything is hung up for the season, excepting the Big Bonanza claim, which will continue to run for four or five days longer, when it also will take a rest.

**HUMBOLDT CANYON MINES.**—The Peeler & Guler company turned off last week and made a general clean-up for the season, the result of which is said to have been large. The work of advancing a tunnel to prospect what is supposed to be the original channel of that branch of the American river which passes through Humboldt, is again resumed by Peeler & Co., and will be prosecuted until the approach of another hydraulic season. Dorer Bros. & Co. are cleaning up the company and others the full width of the stream by a general clean-up, which will take until fall to complete. The work will consist of cleaning bedrock, fumes, ground, sluices and canyons, all of which is thought will pay exceedingly well.

**BLUE CANYON RAVINE MINES.**—The Rough & Ready claim, owned by Geo. Anderson and A. B. Chittie, is on Blue Canyon ravine, one-half mile from its junction with the American river, and contains the full width of the stream by 1,600 feet in length. The gravel deposit is from three to 12 feet in depth, and has been thoroughly prospected by running cuts and sinking shafts to the bedrock. The gravel extracted in this manner was washed by a rocker, through which process it paid \$2.50 per day to the man, one piece found being worth \$7.50. The rocker has now been dispensed with, and preparations are being made to put in a string of sluices, which, when completed, will add one more claim to the list of dividend-paying mines on Blue Canyon ravine. The Roaring Blunder company are extending a drift along the edge of the channel, which is said to be paying very large.

**SHADY RUN MINES.**—The Wild Yankee company have completed the work of a general clean-up, the result of which was the disbursement of large dividends. A large amount of mining timber has been got in readiness, this company will now open up and work their drift diggings until the approach of the wet season. Work in the North American mine continues to progress with encouraging results.

**SUNNY SOUTH.**—Cor. Placer *Argus*, July 7: This is a new mining settlement, six miles or so from Michigan Bluff, and within the new territory, which is about the same altitude. It contains the famous Hidden Treasure claim, the principal owners of which, I understand, are the Cameron Bros., William and Archibald, and M. H. Power. Within a year, this place has sprung into importance—there being already 18 or 20 houses, including two hotels and a store, the latter now being completed. Many of the supplies are brought in on pack animals. There are about 50 men working the claim, which is being well. The water, however, is becoming scarce, and it may be necessary ere long to reduce the working force.

### SAN BERNARDINO.

**ASBESTOS.**—Los Angeles *Herald*, July 1: About a year ago asbestos croppings were discovered in the San Jacinto range by parties from this city and San Diego. A claim was located, and nothing further was done, excepting the incorporation of a company which has since subsided, and the performance of some desultory work in the mine. Mr. F. R. Angell, of this city, and Mr. Faris, of Florence, recently proceeded to the vicinity of the former place, and took up a claim, which they have partially developed with astonishing results. Mr. Angell has returned to this city with the most remarkable specimens of asbestos ever seen. Some of them are two feet and a half long. The longest continuous fiber so far as known was only about eight inches in length. As the longer the fiber the more valuable the deposit, this mine promises to be a very important discovery. A company to work the vein will be immediately organized.

### SIERRA.

**DIVIDEND.**—Mountain *Messenger*, July 7: The Swallow company, of Colorado, declared a dividend for June, of \$200 a little over 30 cents on the \$1 investor.

**EUREKA.**—Times are rather at a standstill just now. Mr. McKay, of San Francisco, an old settler here, is back again on a prospecting expedition. Harry Baker's claim is paying well this season—the one that has yielded so richly for years. Moss & Walker had a good clean-up from all accounts.

## Nevada.

### WASHOE DISTRICT.

**SUTRO TUNNEL.**—Gold Hill *News*, July 11: Total length of tunnel last evening, 17,375 feet. The header continues in easy working ledge porphyry, with streaks of quartz and clay and regular Oostock formation. Very good progress is being made in this material, and even though the report is not true that the miners working in the

combination shaft can hear the blasts let off in the Sutro tunnel, the story will be realized before the end of another year. The course of the tunnel is about 300 feet north of the shaft, and it has to go over 1,200 feet in order to reach a point opposite.

**UTAH.**—Sinking the winze below the 1150-ft level is making the best of progress, the bottom in very favorable quartz and ledge matter.

**SIERRA NEVADA.**—The south drift on the 1500-ft level is being pushed vigorously ahead to meet and connect with a corresponding drift from the Ophir. The north drift on the 1200-ft level is being pushed ahead to connect with the Utah, the face still in very favorable ledge material.

**HALE & NORRIS.**—The water is reduced to a point 100 feet below the 1000-ft level. The water is now being hoisted by the small compressed air pump through the winze on the Savage line and carried to the water tanks, from whence it is carried to the surface. This gives the entire use of the shaft for repairing purposes.

**ORION.**—Daily yield, 40 tons of ore, keeping the Winfield mill steadily running. The dump of the main incline below the 1000-ft station is completed. A drift south from the 1000-ft level has been started and is making good progress. A station has been opened in the south winze at the 1500-ft level, and a cross-cut is now being run to determine the value of the vein. The face of this drift is in very encouraging ledge matter.

**MEXICAN.**—The winze chamber in cross-cut No. 1 on the 1405-ft level is being steadily enlarged and the ore extracted to the mill. The west cross-cut (No. 2) from this drift is at present advancing, the face in fine quartz, showing spots of fine ore.

**LEVATHAN.**—The repairs to the main shaft being about completed, work is resumed in the mine. Cross-cut No. 5 at the 600-ft level, which is being driven east from near the face of the north drift, is in very good looking ledge matter.

**SOLID SILVER.**—The east and west drifts are being pushed steadily ahead to cut the ore vein, which they must do at no very distant day.

**USION COS.**—The drift east at the bottom of the winze on the 1300-ft level is still in a fine character of vein matter, and is being steadily advanced.

**COS. VIRGINIA.**—Daily yield, 500 tons of ore. The ore stops on the 1550, 1500, 1500 and 1400-ft levels show splendidly, and the ore is being steadily advanced. The east drift on the 1700-ft level has penetrated the wall of the ledge and cut the ore vein, which at that point is quite solid and fair grade ore, although not so rich as that on the 1550-ft level further to the northward. Much trouble is experienced in running this drift on account of the great heat caused by a heavy influx of hot steam and vapor created by the hot water now being drawn off in the Best & Belcher and Gould & Curry. The west drift on the 1750-ft level at the C. & C. shaft is in a distance of 300 feet, the face still in very hard blasting rock. Sinking the double winze from below the 1600-ft level has been considerably impeded lately by a strong flow of water. The bottom of the winze is still in good ore. The west ore body on this level is showing better as the ore stops are worked further to the southward. The south drift on the eastern portion of the ore vein has been connected with the east drift from the deep winze, and is now being driven ahead, the face in rich ore. A drift is being run south on the 1550-ft level in the ore vein, which appears to be gradually narrowing down, and is only nine feet in width. Sinking the C. & C. shaft is going steadily ahead. The flow of water is still strong. The usual monthly dividend of \$2 per share, aggregating \$1,080,000, was declared on the 7th inst. The mills are all kept steadily crushing ore, and the prospects of the mine throughout are brighter now than they have been for the past two years.

**CALIFORNIA.**—Daily yield, 550 tons of ore. The ore stops on the 1500, 1550 and 1600-ft levels are all looking well and yielding the usual amounts of good ore. The lateral drift on the cross-cut No. 2 at the 1500-ft level, have been finished and will greatly aid the ore extraction in that portion of the mine. The regular monthly dividend of \$2 per share, aggregating \$1,080,000, was declared on the 7th inst. The mills are all running and crushing ore up to their full capacities and everything in and about the mine looks bright and prosperous for the future.

**JULIA.**—The east drift from the south winze on the 1500-ft level is being pushed steadily ahead to cut the east ledge and to penetrate that portion of the mine lying between the face of the drift and the Ward shaft. The location of this east ore vein has already been pretty well decided, and it is now generally conceded that if the Ward shaft had been continued 100 feet deeper, it would have cut the ledge; also that the heavy body of water recently encountered in the east drift from the 1500-ft level of the shaft came from the east ledge, and it is now proposed to soon start up this east drift and test the merits of the vein.

**GOULD & CURRY.**—Work in the face of the east cross-cut on the 1700-ft level has been temporarily suspended in order to give the strong flow of water from the face an opportunity to drain off, and in the face of the very hot, and the steam arising from it almost suffocating. Clearing the sediment from the bottom of the main incline, preparatory to resuming the sinking, is making good progress. The foundation of the new air compressor is completed.

**COLLIER-POTOM.**—The combination shaft is now down 1,405 feet. Daily yield, 35 tons of ore, the average assay value of which is \$25 per ton.

**YELLOW JACKET.**—The main drift east, cross-cutting the ledge at the 2200-ft level, is to-day in a distance of 100 feet. The material encountered continues to be hard bird's-eye porphyry, and no sign of any east wall is met with yet. The new shaft to the eastward is down 779 feet. The rock continues very hard and plenty of water is coming in.

**BEST & BELCHER.**—The advance drill in the face of east cross-cut No. 3, on the 1700-ft level, has been stopped, and the drift being driven gradually ahead, the rock in the face being quite hard, and the flow of water intensely strong and hot.

**JUSTICE.**—The east drift, on the 1150-ft level, is being pushed vigorously forward to cut the ore vein, the face of the drift in porphyry carrying seams of quartz and the bearing of a very fine character. The main shaft drift, on the 1000-ft level, is showing the ledge to be very solid, and the quality of ore good.

**OVERMAN.**—The north drift on the 1400-ft level running to connect with the Belcher mine is making steady progress, the face in hard porphyry carrying occasional streaks of free quartz.

**LUTHERAL CONSOLIDATED.**—The north drift on the 2350-ft level is being rapidly advanced, the face in favorable ledge matter. The east cross-cut near the center of the mine is showing very favorable features.

**NORTH CONSOLIDATED VIRGINIA.**—The water is all out of the shaft, and sinking was resumed last Monday morning.

**CROWN POINT.**—The south drift on the 2000-ft level, running to connect with the Belcher drain shaft, is being driven energetically forward.

**SAVAGE.**—During the first part of the week the water gained steadily on the pumps, since which time the decrease has been very rapid, so that to-day the water is reduced a little over 100 feet below the 1900-ft level.

**HOMESTEAD.**—Sinking the shaft was resumed on Saturday last. Good headway is now being made, the formation continuing to be very favorable.

**BELCHER.**—Sinking the drain shaft is going steadily forward.

**ALTA.**—The west drift from the 1050-ft station is being pushed steadily ahead, the face in hard blasting porphyry.

**STEELE.**—Sinking the shaft is making the best of progress, the rock in the bottom beginning to soften somewhat and carry a heavy body of water.

**KEYSTONE.**—Sinking the shaft is being pushed with steady vigor, the porphyry in the bottom showing evident signs of softening, with an occasional small streak of hard quartz.

**NEW YORK.**—The work of draining and clearing out the bottom of the shaft, preparatory to sinking, is being urged forward.

### EUREKA DISTRICT.

**THE MATAMORAS MINE AND FURNACE.**—Eureka *Sentinel*,

July 8: Since the settlement of the affairs of the mine, a force of men have been engaged in prospecting and extracting ore. The developments are very encouraging, and both the quality and quantity of the ore taken out warrant the company in starting a furnace, which at the present time they are making preparations to do. The old Buttercup belongs to the Matamoros, and that institution is undergoing a thorough overhauling, so as to be ready to commence operations upon the new 20-stamp receiving at the furnace about two and a half tons of high grade ore daily, all of which is packed from the mine on muleback. This is the only mode of transportation that can be used, the mountainous situation of the mine, and the absence of roads, making it necessary to employ a pack train.

**PAPAGO MOUNTAIN MINES.**—The Bullion Mine is on the southwest side of Prospect mountain. The formation is limestone and quartzite. Two shafts have been sunk to a depth of 50 feet each, exploring well-defined walls, between which the ore bodies are found. The vein matter is a quartzite gangue, and the ore extracted smelts readily and carries a high percentage of lead, besides being rich in the precious metals. The location embraces 1,500 feet of surface ground. The Western side of the Bullion on the southwest, and embraces the same amount of surface ground. The lode is traceable on the surface for quite a distance, and a shaft is sunk on the croppings to a depth of 60 feet. The lode is eight feet wide and uniform in size from the surface to the bottom of the shaft. A tunnel has been started on the slope of the mountain that will take the lode at a depth of 300 feet, and when its completion, facilitate the extraction of ore. Both the above mines have yielded some very high grade ore, and are among the valuable properties in that vicinity.

### WARD DISTRICT.

**STARTED UP.**—Ward *Reflex*, July 5: On Friday last one smelter and cupel furnace of the Martin White company started up. The result to date is 12 bars of bullion from the cupel furnace, which will be put through again. Litharge is what they are after particularly at present, so it is not surprising the bars do not exceed 300 in fineness, ores rich in lead taking the preference. Mr. Smith, who has charge of the cupel, says at least \$10,000 in fine bullion will be ready for shipment by Monday, so it can readily be seen the product of even one furnace will be greatly in excess of the above each week, when ores rich in silver are smelted. When an abundance of litharge has been secured, a far different result may be looked for. Possibly \$25,000 or \$30,000 in fine bullion will be produced weekly when both furnaces get down to their work. Preparations for starting the other furnaces are now being made. The result so far can be said to exceed expectations, all things considered. With a number of these furnaces in operation, Ward would not long remain in the background, but would come prominently to the front. A few weeks will decide now more than the past year has done.

## Arizona.

**MOHAVE.**—Arizona *Miner*, July 7: The latest advices from Mohave county are of the most flattering nature. The McCracken company have thousands of tons of ore upon their dump. The Greenwood mill is pounding away upon ore from this mammoth mine, and the result is that the company are shipping \$30,000 per month. Preparations are being made for the erection of a new 20-stamp mill to be put up on the Sandy. The Leet company are also owners on this celebrated bonanza, and have a new 10-stamp mill well nigh unto completion. The Mineral Park people are also prospecting and opening the many valuable mines that exist in the immediate vicinity of this healthy, growing town. Then the Hackberry mine and mills are doing a good work. The shipments from the Hackberry mine are of such a nature that the mineral capacities of the lode to be of a superior character.

In Yavapai we have the Black Warrior, Prince, Kit Carson, Tip-Top, Swilling and many leads that are producing ore of an incredulous high grade, much of which is being shipped to San Francisco for treatment. The Peak is working away as usual, producing about \$40,000 per month, which will be increased to at least \$100,000 per month as soon as their new mill is erected, now within 25 miles of the mine.

The Zidias and Miriam lodes, owned by Dr. Day, Jay G. Kelly, A. O. Noyes and Hon. Thos. Fitch, are attracting much attention from the mining men. In Turkey Creek, the Oodwin mine is producing excellent high-grade ore and the lead shows a face of ore 10 feet wide. Other mines in that district show equally good with the Goodwin.

In Bradshaw, Luke's mill is ready to run ore. From the Black hills, north of Prescott 30 miles, miners report very rich silver and gold ores, and many hardy prospectors are tearing the tops from the various quartz croppings that exist throughout the whole of that section. Many new locations have been made since last week, and we learn that some are considered valuable.

## Colorado.

**EAGLE BIRD.**—This mine furnishes employment for nine men on three different leases. The main adit is now in a distance of 400 feet, and a shaft 150 feet deep has been sunk from this level.

**EAST BAXTER.**—This mine has been closed, but work has been resumed. A winze is under process of sinking on the 113-ft level; when this is completed a drift 60 feet long will connect it with the foot of the engine shaft, which will answer the double purpose of opening up ground and thoroughly ventilating the mine.

**THE LITTLE ANNIE.**—This is the name of a lode discovered on the 15th of May, two miles north of Mill City, on the Fall River, north of the property of Thos. McCunniff and B. F. Napheys. It carries 18 inches of mineral.

**RED BIRD.**—This lode on Republican mountain is cut by a tunnel 100 feet long, which is continued to the north wall, making a total length of 130 feet. The ore shows black sulphurets, brittle silver and blue carbonate of copper.

**AT THE SNOW DRIFT.**—Messrs. Meyers and Martincourt have taken a lease on and are putting in a tunnel to cut this lode. The tunnel has been run in a distance of 80 feet.

**AMAZON.**—J. Mackintosh, J. Rey, David Hill and Ed. Kane are the owners of this lode on the east side of Cherokee gulch. A large, substantially-timbered tunnel cuts the Amazon lode at 80 feet from its mouth, and at an angle of about 45 degrees.

**EAST DIVES.**—Messrs. Sanders and Fountain have this end of the mine leased, and the former informs us that they are employing a force of 15 men, who have been doing considerable dead work recently, putting in two drift east—on the 400-ft and the 800-ft levels—besides six miners who are constantly on the 800-ft level, where they have a vein of mineral varying from three to ten inches in width, which averages about 175 ozs. per ton.

**S. J. THILES.**—We have another fine run to report this week from this lode, the property of the Marshall silver mining company, Messrs. Bruce & Co., lessees.

## Idaho.

**GOLDEN CHARIOT.**—Owyhee *Avantache*, July 7: Work at the Golden Chariot is progressing favorably, preparatory to sinking. The machinery is being overhauled and placed in thorough condition. Contracts have been awarded for sinking the shaft to a depth of 300 feet, so that Mr. West is to retain his position as foreman. The Minnesota works will be brought into requisition in the disposition of the water. There is a general feeling of hope that the work now being so auspiciously begun in the Chariot will lead to developments that will open up a brighter era than ever for Owyhee, and we are sanguine that such will be the result.

At the Empire, operations are progressing very favorably, and the mine is looking remarkably well in every direction. The slopes are yielding a good supply of rich rock, the crushing from which bids fair to exceed the most sanguine expectations of all interested. Altogether, a handsome clean-up may be expected from the rock now

### Sebastin—A New Safety Dynamite.

An improved nitro-glycerine compound has been invented by Mr. Gustaf Fahnehjelm, of Stockholm, the chief modification being that the second main ingredient is charcoal produced from a special wood, and selected and prepared in such a manner as to be able to absorb and solidify the greatest possible quantity of nitro-glycerine. In order to render the combustion more complete, and to augment the rapidity of the explosion, a small quantity of nitrate of potass, or other suitable salt, is added to the mixture of the two ingredients above named. The London *Mining Journal* says Mr. Fahnehjelm is aware of the existence of patents for explosive compounds in which nitro-glycerine and wood charcoal are mixed with explosive salts, and especially with chlorate of potass, but in those compounds the salts are applied in large quantity, and serve as the chief base of the compound, while only a small proportion of nitro-glycerine is added, and only for the purpose of igniting and exploding the compound. This new compound thus differs from the ordinary dynamite, in which the nitro-glycerine is absorbed by the infusorial earth, in that the solidification of the oil is effected by the aid of an active base—charcoal of a special kind; and it differs from other explosives, firstly, by reason of the application of the charcoal of a special kind, which is able to absorb from five to six times its weight of nitro-glycerine; secondly, by reason of the proportions of the substances, which will be explained further on.

In the ordinary dynamite, the infusorial earth cannot keep and retain the oil absorbed under certain circumstances. When such a dynamite is exposed to changes of temperature, and especially when it has become frozen, and then passes into the pasty state again, a part of the nitro-glycerine becomes separated from the mixture. The danger resulting therefrom is not greatly to be feared if the nitro-glycerine is absorbed by a charcoal of the kind used in the improved process here in question. In order to produce a charcoal having the required qualities, the carbonization or coking must be done in such a manner as to completely destroy the organic substances, and to produce as porous a charcoal as possible. For this he selects by preference young trees or stripplings, or branches of poplar, hazel wood or alder tree, and he burns them in an open fire. When the wood has been consumed he does not put out the fire by means of water, but leaves it to go out of itself. In this way he obtains a very inflammable and very porous charcoal, which can absorb more than five, and approaching six times its weight of nitro-glycerine without any risk of the separation of the oil. The charcoal is pulverized in a wooden mortar, but it should not be reduced to too fine a powder, else it will not so completely absorb the nitro-glycerine. The charcoal produced in the ordinary way, or by closed fire, is quite different as regards absorbing power. Charcoal of fir trees may, however, be used, and may acquire nearly the same qualities, that is if charred a second time in a special oven.

By mixing the different kinds of charcoal a material may be obtained possessing the required absorbing qualities, and an explosive compound may then be obtained of the required power without loss of the necessary consistency—that is, without being too dry, which is not desirable. The charcoal not only serves as the best absorbent for the nitro-glycerine, but it plays also an important part in the combustion. The nitro-glycerine in exploding decomposes into steam, carbonic acid, nitrogen and oxygen. In the explosion of dynamite with inert base the oxygen goes away without being utilized, but in the explosion of this new compound (the new sebastin as he calls it) a part of the absorbent charcoal is burnt by means of the liberated oxygen. The quantity of gas is thus augmented, and also the development of heat, whereby again the tension of this gas is augmented. As, however, the quantity of charcoal necessary for the complete absorption of the nitro-glycerine is in all cases much larger than that which can reduce the excess oxygen produced at the explosion into carbonic acid, he adds to the compound a salt, which also by the combustion gives an excess amount of oxygen, which may contribute to burn the rest of the charcoal. For this purpose he uses by preference nitrate of potass, which may be added without any risk, and which gives the explosive compound a very much greater rapidity or vehemence, and consequent force of explosion.

The composition of the new sebastin depends upon the objects for which it is to be used, and the effects intended to be produced. The strongest compound, and even in this there is stated to be no risk of the separation of the nitro-glycerine, is composed of 78 parts by weight of nitro-glycerine, 14 of the wood charcoal, and 8 of nitrate of potass; and when less power is required the proportions are varied, the second quality consisting of 68% by weight of nitro-glycerine, 20 of the charcoal and 12 of nitrate of potass. To show the relative strength of the compounds, the inventor says: Let the dynamic force of pure nitro-glycerine be represented by the number 2,884,043.6, then the dynamic force of sebastin No. 1, as above, will be indicated by 2,416,575, and of the sebastin No. 2 by 1,933,079.4, while that of dynamite No. 1 (consisting of 75% of nitro-glycerine and 25% of infusorial earth) will be

represented by 1,674,694. For the above qualities of sebastin the increased effect produced by the greater rapidity of the explosion must be taken into account also. The increase has not yet been measured, but it is estimated at 10%. The sebastin may also be compounded in other proportions of the constituent parts, but the object being to produce explosive compounds of the greatest force which it is possible to employ without danger, he merely mentions that the proportion by weight may vary from 50% to 80% of nitro-glycerine, 15% to 35% of the prepared charcoal, and 5% to 20% of the nitrate of potass.

It is to be distinctly understood that Mr. Fahnehjelm does not claim the combination of nitro-glycerine and wood charcoal in general, but the production of a solid compound of nitro-glycerine and a wood charcoal prepared in the special mode or modes set forth, the nitro-glycerine being the principal ingredient which is absorbed by the wood charcoal to the extent of more than five and reaching nearly six times its weight without risk of this compound parting with any of its oil as set forth; and secondly, the addition to such solidified nitro-glycerine of a quantity of nitrate of potass, or other suitable salt, not exceeding 20% of the whole mass, for the purpose of rendering the combustion as complete as possible.

### Kentucky Ridge Mine.

This mine, says the *Grass Valley Union*, situated on Deer creek, one mile from Randolph Flat, is one of the new mines of this district but is rapidly coming into prominence as a good mine. On Friday our reporter went down with the Superintendent of the mine, Mr. Joseph Snyder, to take a look at things, and with Mr. Snyder's assistance managed to get a pretty good idea of what had been done there. The ledge was discovered about a year and a half ago by three Rough and Ready men, who sunk a short incline on the ledge and took out some rock, but were finally compelled to stop work on account of water. What rock they were able to take out prospected well. A crushing taken out at the croppings, milled \$18 per ton, and at the bottom of the incline it yielded \$40 per ton. But not having money to put up the necessary hoisting works, the company was compelled to suspend operations, and becoming discouraged they finally sold the mine to Mr. Snyder. This gentleman organized a company, incorporated, and immediately commenced work in a systematic manner. About three months since tunneling was commenced, and after running a short distance the ledge was cut, and drifts were run preparatory to taking out quartz. The drift toward the east is in 154 feet, and that to the west 260 feet. In the drifts the ledge ranges from 18 inches to three feet in thickness, and is full of gold. A second tunnel was started, for the purpose of cutting the ledge at a greater depth. This tunnel is now in 220 feet, and has 125 feet further to run before it cuts the ledge. For the present work in the lower tunnel has been suspended, on account of hard rock, until the mill is completed, when an air compressor and Ingersoll drill will be put in. And this reminds us of the mill. About five weeks ago, work was commenced on the buildings for the mine. The boarding-house is already running, an office and a blacksmith shop erected, and the mill is progressing rapidly. It will at first consist of eight stamps, with room for 40, and be run by a 31-foot overshot wheel. Water for the wheel is plenty. A dam has already been put in across Deer creek, three-fourths of a mile from the mill, and the ditch is dug. The mill will be running by the middle of the month. The dam is as perfect a structure of its kind as can be found anywhere. It is made of large hewed timbers firmly anchored to the granite by heavy iron rods, in such a manner that no freshet can possibly carry it away. The ditch is protected by a break-water, seven feet high. A sand gate is provided at a greater depth than the mouth of the flume, so that there will be no danger of the ditch being filled up with sand. We can in this article give but a meager idea of what has been done at the Kentucky Ridge, but feel safe in saying that before the end of another month the mine will be able to speak for itself.

"SLICKENS" A GREAT BENEFIT.—The *Chico Enterprise* states that the lands around Nelson, Butte county, which were covered with the debris of "slickens" from the mines of Cherokee, and which were condemned as worthless three years ago, for which the Cherokee company had to pay a high price to the owners as damages, were put under the plow last year, and this year have yielded a crop equal, if not superior, to any in that section. Thus the mining company has gained considerable by the ultimate purchase of the land. It appears that the mixing of the debris from the mines with the adobe soil is a benefit instead of an injury, as it makes it free and easily worked. There are many other instances where lands have been benefited by the "slickens" overflow from the mines. The *Bee* says: The wash from the mines is full of enriching qualities and might be used to great advantage upon the clayey or adobe soils. There is nothing more fertile than the soil taken from the American river, at its junction with the Sacramento. It is as rich as barnyard soil, and more desirable in some cases. If farmers would utilize the "slickens" instead of abuse them, they would find in them an ever present and reliable friend.

### Profits of Smelting in Utah.

The product of lead in Bingham canyon is a matter of serious importance to this Territory, as that camp sends out nearly one-half the lead produced in Utah. While the mineral bodies in Bingham are unprecedentedly large, unfortunately the ore runs comparatively low in silver, and the mines in this district are therefore more seriously affected by the depressed state of the lead market than those of any other camp in the Territory. On the other hand, the Cottonwood ores run higher in silver, but they lie in small veins or bodies, and the work of extraction is more expensive in this district, as a rule, than in Bingham; hence the low price of lead affects both camps about equally. But Bingham furnishes the greater quantity of ore. The Old Telegraph, Revere, Yosemite, Winnamuck and Spanish, besides numerous small mines and jiggers, all produce lead ore, though not as much as they could did the market demand more. Yet the producing capacity of this camp avails us nothing, as it is absolutely impossible for any man to produce and sell hullion in this Territory for less than \$65 per ton. The lead standard on which ores are purchased here is 35 per cent, and even at that our small mines can hardly be kept open. The average ore will not run as high as 45 per cent. In lead, so that the miner, who gets 50 cents per unit for each unit above the standard of 35 per cent., will realize not to exceed \$5 per ton on his ore for the lead it contains. The cost of getting ore to the smelters from the best managed mines in Bingham is for each ton, \$6.00; freight, \$3.25; sampling, \$1.25; interest and wear and tear, \$1.50; total, \$12.00. The cost of getting one ton of lead ore to the smelter being \$12, and the miner having realized but \$5 for the lead his ore contains, he is obliged to make up the deficit of \$7 in the cost of producing that one ton out of the silver the ore contains.

The smelter purchases lead ore from the miner on a standard of 35%, paying the market price for the silver it contains and 50 cents per unit for each unit of lead above the standard. It requires to produce one ton of hullion two and a half tons of ore, for which, allowing it to contain 45% lead, the smelter pays \$12.50; the cost of smelting a ton of hullion is \$50, allowing a loss of 10% in the process, and the wear and tear of machinery and interest on the money are estimated by all our mining men at \$2.50. That is, the final cost of turning out one ton of hullion at one of our smelters is \$65. The present rate of freight from Utah to New York is \$32.50. On the arrival of the bullion at its place of destination, it must be desilverized, a process which costs the bullion producer \$16, and is accomplished by a loss, to be borne by himself, of 4% of the lead, with 50 cents per ton brokerage. After desilverization, the hullion producer has 1,920 pounds of lead in New York ready for the market, which at six cents per pound he would realize on the sale \$115.20, with a profit of \$1.20 per ton.

#### RECAPITULATION.

Bullion, 1,920 lbs., at 6 cents.....	\$115.20
Ore 2½ tons.....	\$12.50
Wear and tear on smelter.....	2.50
Smelting.....	50.00
Freight.....	32.50
Desilverization.....	16.00
Brokerage.....	50
	\$114.00
	\$114.00
Net profit on one ton.....	\$1.20

If this profit were always sure, and the supply of lead ore unlimited beyond question, the smelting business would pay, and Bingham miners would be happy; but when the price of lead drops the fraction of a cent in price, the smelting business in Utah gets "sick," as the miners term it. But as a matter of fact, the average lead ore does not run above 40% in lead, which is a condition that greatly increases the cost of fluxing, and hence the cost of bullion is proportionately increased. The large bodies of carbonate ore in the Bingham mines are nearly worked out, but below the water level the sulphuret ore bodies are immense, and need only cheaper fuel and lower freights to allow of their being worked.

The smelters of Sandy and Beaver shipped to Salt Lake City during June nearly 1,373 tons of bullion; and the Chicago smelter, of Tooele county, nearly 210 tons, but only 1,276 tons have been forwarded out of the Territory, together with 780 tons of ore. Mr. Geo. Y. Wallace has nearly 40 carloads of hullion stored in his warehouse at the depot in this city; about 30 carloads are piled up in the depot yard, and at all the smelters in this county there are from five to twenty carloads stacked up awaiting the reduction in the price in freight. Without being able to get exactly at the figures, it is estimated by some of our producers that we have in this market about 1,000 tons of lead to be shipped when the price will allow. On the whole, the product has fallen off during the past month about one-third.

DRY ROT.—The best preservative against dry rot is the following of Mr. Schwartz, who made millions by it, and by whose recent death the secret was revealed: One part oil of cassia, one part wood tar and one part train oil; apply three coats on the reverse sides and on the ends of planks, floors, etc. In all probability oil of cassia played the chief role as preservative. *Am. Jour. Pharm.*

### Extensive Development of the Yorkshire Coalfield.

In no part of the kingdom have the mineral deposits been more extensively tapped and developed than in the West Riding of Yorkshire, and this process is still going on almost as rapidly as ever. In 1855 the entire quantity of coal raised in Yorkshire was 7,747,470 tons, and in 1875 it had increased to 15,855,990 tons, having more than doubled in about 20 years. From the number of new collieries recently opened out, and those in course of sinking, it is evident that the progress made during the past 20 years will now be greatly exceeded. In 1872, when the price of coal advanced very much and consumers began to fear that there was about to be a famine, there were 441 collieries in Yorkshire, but after that time, by private enterprise and limited liability companies, the number rapidly increased, so that in 1874 there were 521, and in 1876, according to Mr. Wardell's report, just issued, 539. In the intervals between the periods named, many small collieries were closed, and the actual number of new ones commenced would be at least 140 or 150. According to the report for 1876, when it was written there were no less than 112 collieries in the course of sinking, but since then several have been opened out, and will be the most extensive in the entire Midland field. In the Barnsley district alone the Silkstone coal has been won by the Barrow Hematite company, and the produce before long will be 1,000 tons a day. The same seam has also been reached in the Rockingham colliery, and that at Hoyland, where the output will be about the same, to say the least. The nine feet bed has been reached at Carlton Main, Corton Wood, Mitchell's Main, while a five feet seam has been tapped by Mr. Fossick, near to Hemsworth. The productive power of all these collieries, when in full operation, is estimated at not less than 2,000,000 tons a year. In addition to the above, there are several other collieries being sunk to the thick coal in the same locality. In the Bradford district, where the seams are rather thin, in 1876 there was in the course of sinking five new collieries; in Dewsbury, eight; Halifax, seven; Huddersfield, ten; Leeds, 28; Pontefract, five; Rotherham, seven; Sheffield, 20; Wakefield, 14; etc. The fact of so many large mines being opened out in Yorkshire alone, that will add, if necessary, several millions of tons annually to the present production, must do away with any ideas as to there being a dearth of coal for many years to come, the question to be solved being as to where markets are to be found for what is being raised. With such a superabundance of coal there is no fear of prices advancing, the probability being the other way.—*Sheffield Telegraph.*

### The World's Fair of 1878.

The latest notes of the progress of the Paris universal exposition of 1878 we find in the *Polytechnic Review*, translated from a French paper: While the East is aflame with the furie of war, France steadily continues in preparing the pacific work which is intended to render illustrious the year 1878. The work of the exposition advances with rapid strides. The Trocadero, despite the delay caused by too lightly conceived plans, has risen above the first story; in six weeks the general commissioner, whose energy has repaired the errors of his lieutenants, will have all the floor timbers and rafters in position; the iron framing has been accorded to the house of Joly, of Argenteuil.

In the Champ de Mars, the great work of the four pavilions at the angles is finished; the same is true of the palace of fine arts, which is to occupy the center position. The constructore charged with the metallic covering, the house of Cail, Creuzot, the factory of Fives-Lille, MM. Eiffel et Cie. have erected their trestle work and their rolling scaffolds. These four houses are superintending the construction of the four great galleries which unite two and two the pavilions at the angles; their framing and platform are mounted on wheels and placed on car tracks so that they can be readily moved along as the work progresses. Besides this work, all the underground water and gas pipes, ventilating flues, etc., are in position.

The question of the bridge of Jena has been settled very simply by an enlargement obtained by the help of metallic brackets; the execution of this work is intrusted to the house of Joly, as is also the construction of the bridges at the Billy and Orsay wharves. The greatest animation reigns in the timber yard, and it is well that it is so, for it is absolutely necessary that the work should be pushed forward as rapidly as possible, for it is already feared that the buildings now under way will be insufficient to accommodate all requirements. For group six (implements and products of the mechanic industries) a covered annex of 25,000 meters in length has been constructed on Bourdonnais avenue on the bank of the Seine, and on the Billy wharf. These constructions should effectually silence those who have been constantly predicting the non-completion of the buildings in time for the opening of the exhibition. The people have responded most enthusiastically to the appeal of the government. The demand for space, in the French section, not comprising the fine arts and agriculture, exceeds 26,000, and in group six, before referred to, exceeds 112,000 meters, of which the administration can supply but 36,000, which will be filled with the most choice of the national industries.

## Aurora and Bodie Districts.

Judge McClinton, who returned from a visit to the Bodie mining district a day or two since, says the Carson *Appeal*, puts us in possession of the following valuable facts in relation to that interesting region: The Standard mine, which is developing so splendidly, is situated on what is known as Bunker Hill. The mines have been known—or rather, they have been visited—for about 20 years. Many of our readers who date back to the early days of California will recollect the Kern river excitement. That was in 1857, or thereabouts. That was a failure in the gold finding way, but it led to the discovery of the Meno mines, or more correctly it led to the finding of some placers near where the Bodie quartz mines are now opening. Bodie himself fell a victim to his venturesomeness. He was frozen to death near the mining camp which now bears his name. The town of Bodie is about ten miles southwest of Aurora. The Standard mine is some 9,000 feet above the sea. It was formerly known as the Bullion. It was discovered many years ago, as we have intimated. After being frequently located, abandoned, jumped and re-located, it has finally come into possession of Daniel and Seth Cook, of San Francisco, and their associates, among whom are John B. Boyd, George W. Storoy and at one time Col. Charles W. Tozer. This mine is showing wonderfully. The ore now being extracted is that which is taken from the winzes between the 200 and 300-foot levels. There has yet been no stopping. There is every indication of an unbroken body of pay ore throughout the entire extent of the ledge. This ore assays all the way from the lower grades, say \$35 or \$40 per ton to \$1,300, and there is a large body of ore which assays as high as \$6,500 to the ton. The metal is mostly gold, the proportion of silver being very small. The Syndicate mill and mining company are working these ores in their mill. The ore is perfectly tractable and works freely by ordinary mill process. The Standard company's new 20-stamp mill will be completed by the 10th of July. At present there are 65 miners at work there. Tamarack timbers are being obtained from a distance of 15 miles from the Sierras. There is not a drop of water so far with which to contend. The lode lies in fine porphyry. The Syndicate company also have a mine in the same district. Fred. Bechtel, late of Aurora, and Henry G. Blaisdell are located there. It is Judge McClinton's opinion that these Bodie mines are going to prove very rich. His opinion seems well founded. The Cook Brothers, who are the principal owners in the Standard, feel assured of their fortunes. The appearances justify the opinion that they own one of the very best mines on the coast.

Here in Aurora (where, in 1861-2-3-4, millions of dollars were taken out of the mines, and in no instance were the mines opened and developed to any depth) there are daily new faces seen on the streets. Some are already making arrangements for prospecting and further developing the long abandoned mines of this district. Capital is all that is required here to astonish the entire Pacific coast with the amount of gold and silver that these mines can be made to produce with the aid of enterprise and energy to push ahead.

## Colorado and Poor Men.

Colorado is the paradise of the poor man. This is especially true if the poor man happens to be a miner or prospector. He is bothered by no "proud man's contumely," for our native aristocrat knows full well that the man he meets "with buckskin patch conspicuous on the rear" may possibly the next week be a millionaire. The miner also has another advantage over the poor laborer in the Eastern States. The field of his labor is under the ground, far away from the sight of man. He has a nice cool place to work, where no proud passer-by can have a chance to scornfully look at him as an inferior being. The work he has to do, when his hands are skillfully trained, is easy, and there is an excitement about it that makes each day interesting. If the vein is large and rich he feels conscious of his importance, for he knows he is unlocking nature's strongest safe and taking therefrom coin for all people and adding to the wealth of the world. If the crevice happens to be narrow and the ore poor he works with the hope of its getting better. Therefore whether in "poverty's vale or abounding in wealth" his labor is lightened by a pleasing excitement which hastens the close of day and cheers him on to the end of the week.

Compared with the common outdoor laborer in most of the Eastern States he is a prince. If he be a true man, with honest heart and clear head, he has a hundred chances here of becoming a prince in fact, where he would have hardly one in the East.

We have room here in Colorado for many more men who are not afraid and who know how to work. The oldest districts have not yet been thoroughly prospected. In this the very oldest, within the past year, new lodes have been found which now daily produce thousands of dollars, and are admitted to be the most profitable mines in the whole country. Other portions of the State present equally tempting inducements to the laboring man. These and other good reasons which we might mention, induce us to say to the honest laborer of the East—come to Colorado.—*Miner*.

## Useful Information.

## How Coffee is Adulterated.

Professor S. P. Sharpley, the State Assayer of Massachusetts, is making some analyses of articles of food, which are resulting in interesting disclosures. Package coffee has engaged his attention, but he has found very few traces of the berry itself. The following are some of the results of his examination:

"Hayward and Co.'s French breakfast coffee," the label of which sets forth that only three-quarters as much of it need be used as would be required if ordinary coffee was employed, is found to contain no coffee at all, but to be made of green peas, burned molasses and "an occasional grain of rye."

A package of "Pure roasted and ground Cape coffee" was found to be made wholly of peas and nutshells, the latter floating when the mixture was put into water.

A package of "Kimball's first quality Mocha and Java coffee" also contained no coffee at all but was made of peas and rye.

"Glinee's extra quality French coffee" was almost destitute of any foreign substance, peas and rye predominating, with a few oats.

"Chase's English breakfast coffee" is a large consumer of peas, the traces of coffee being so slight that the assayer pronounces them accidental. Happily the analyses have not disclosed the presence of any positively injurious substance, and if people who can easily find out the cost of a pound of green coffee, expect to buy a like quantity roasted and ground for half the price, they deserve to drink weak pea soup. For detecting adulterations the following rules are given:

Take some cold water in a glass and throw upon it about half a tea-spoonful of the coffee to be tested, stirring it around so as to wet the grains. Pure coffee will float and scarcely color the water. Beans and chicory sink to the bottom. Chicory colors the water at once, beans more slowly. Test the part that floats by chewing it. Coffee will thus be recognized by its taste. Nut shells, which also float, are hard and brittle. A species of nut which has lately come into use strongly resembles coffee when ground up, by floating on the water as well as by its feeling between the teeth; but the difference can easily be detected, because the adulterating ingredient is nearly tasteless. After subjecting the suspected article to the above test spread some of it on a sheet of paper and examine it carefully for grains of rye, oats and peas. The pea ingredient will frequently be found in pieces one-eighth the size of a pea and the rye in half grains. Chicory is tough when taken between the teeth and has a bitter taste, different from the bitter of coffee.

Another article which has been looked into is cream of tartar in packages. Much of it contains no cream of tartar at all, but is composed of acid, phosphate of lime, starch and gypsum.

As to the roasted peas and rye which are sold instead of coffee, it is pretty certain that they are more wholesome than the fruit of the coffee plant, being destitute of any narcotic quality; but the thing is a fraud, and it would be better for families—cheaper at least—to roast their own peas and make their own weak pea soup. As to chicory, it is well known that at the restaurants in Paris and other French towns all the coffee served to customers is largely adulterated with the roasted root of that plant, which is cultivated for that purpose.

## Creosoted Timber.

Mr. Edward R. Andrew, of Boston, has leased a large tract of land from the Boston Wharf Company in South Boston, for the purpose of erecting thereon works for creosoting lumber. The impregnation of the pores of wood with creosote for the purpose of preserving it from decay and the attacks of insects, especially the teredo or naval worm, which is also destructive to shipping, wooden piers, piles, etc., in certain localities, was first commenced in England in 1838 by Mr. Betbell, who discovered the efficacy of creosote, and erected works for treating wood with it. At first it was used for sleepers for railways. Its introduction was naturally slow at first, but as its advantages became known its use was gradually extended, until now there is scarcely a railroad in Great Britain or on the continent where creosoted ties are not used. Wood whose pores have been thoroughly impregnated with creosote will resist decay. The treatment with creosote was attempted in Boston some years ago, but the works were insufficient for the purpose, having been put up for another use and altered over for creosoting. Yet the timber creosoted at that time, although imperfectly treated, has, in most cases, given satisfaction, and is to-day, after five or six years' test, according to the Boston *Post*, perfectly sound, as can be seen in a portion of wooden pavement on Columbus avenue. At the French exposition of 1867 sleepers were exhibited which had been in wear on English roads since 1838, and yet were perfectly sound. The plant Mr. Andrews has ordered from the Whittier Machine Company. The principal tank or receiver in which the wood is to be treated is to be of one-half inch iron, cylinder 100 feet long and six feet diameter, and warranted to stand a working pressure of 200 lbs. to the square inch. This receiver will hold nearly 26,000 feet of lumber. The works will be completed about August 1st.

## Disinfectants.

The commission appointed by the Academy of Medicine of St. Petersburg, to study the effect of the different antiseptic substances and disinfectants so-called, came to the following conclusions, which are printed in the *Annales du Genie Civil*:

1. Carbonic acid is most efficacious in preventing the formation of ammonia, and the development of inferior organisms by the decomposition of organic matter; it is, in consequence, the best antiseptic.

2. Oil of vitriol, the salts of zinc, and charcoal are the most active for neutralizing the foul odors originating from putrid matter.

3. The powders of Prof. Kitzky, together with the properties which they possess in common with other carbonated disinfectants, attracted attention by reason of their isolating the phenol and the quick-lime which enter into their composition. These absorb moisture, as well as the gases which are formed by decomposition.

4. Chloride of lime and permanganate of potassa act promptly in destroying the inferior organisms found in putrid liquids.

5. These disinfectants retard, in a measure, the development of putrefaction in organic matter, but their influence is but momentary. As regards the purification of apartments, their influence is but feeble, if not totally ineffectual, by reason of the small degree of concentration of their elements, and are also little employed on account of their influence on the health of the occupants.

6. For buildings not inhabited, chlorine and nitrous acid are the best disinfectants that can be employed.

A WARNING.—He who champions the cause of the workman, falls far short of his duty if he fails to warn him against one terrible common enemy, the liquor saloon. If you are not a temperance man, there is all the more reason why you should look this subject fair in the face. The saloon is not an industrial concern. It neither feeds nor clothes you. It adds neither to your comforts nor enjoyments. It is a trap placed upon nearly every corner, to catch your money without giving a profitable return. It absorbs a portion of your earnings, and leaves you none the better for it, but very likely much the worse in morals, health, pocket and self-respect. You know that this is so if you stop to think. The seeds of numberless evils and none whatever of good to mankind grow in these hot-beds of corruption. We beg our friends, the workmen, to avoid liquor saloons. If you can find no other society nor place of resort, you are indeed unfortunate; but better none than such as thus lowers your manhood and your purse.—*Cal. Agriculturist*.

## GOOD HEALTH.

## Treatment for Lead and Mercury Poisoning.

Our workers in lead and quicksilver will be interested in the following, from *Iron*: To a Belgian professor, M. Melsens, the Paris Academy of Sciences awarded, last April, the prize of £100 founded by M. Anget de Montyon to encourage the invention of processes for diminishing the risks of unwholesome trades. This prize was decreed to M. Melsens for his method of curing and preventing lead and mercurial poisoning. The report of the committee appointed to examine into M. Melsens' process is as follows:

Thirty years ago Prof. Melsens pointed out iodide of potassium as a means for successfully combating the ill effects of lead or mercury on the human body. Experiments undertaken in conjunction with Prof. Guillot confirmed the results first obtained by M. Melsens, who has since for a long period been pursuing his investigations and experiments.

Considering saturnine or mercurial affections as being due to the presence of metal in the organs which are the seats of those affections, M. Melsens administers graduated doses of iodide of potassium. The noxious metals are, by the action of this drug, carried away in the urine in the form of double soluble iodides. M. Melsens also advises the use of the iodide of potassium as a preventive in cases where men are exposed to the effects of lead-dust or mercurial emanations.

Numerous experiments in the course of 30 years have proved the practical value of this system of treatment. Workmen affected with lead paralysis have been cured; others, who were unable to follow their calling from their liability to saturnine colic, have been enabled to take it up again, fortified by a regimen of which a dose of iodide of potassium formed part. The result of the observations made at Brussels and Lille, and the letters and certificates sent to the Academy, leave no doubt on the point.

With regard to mercurial affections the observation made by M. Melsens in person have been confirmed by those made at the mercury mines at Idria. The workmen engaged in the manipulation of mercury and mercurial products at the Idria mines have been made the subject of various methods of treatment, curative or preventive, and the good effects of the iodide are no longer doubted of.

At a special hospital in Vienna, ample occasion has been furnished to watch the action of the iodide in freeing the body from the presence

of fixed mercury and preventing its fixation. It has been found that in presence of the drug the symptoms characteristic of the mercury are removed or diminished, or prevented from declaring themselves.

The action of the iodide of potassium, according to M. Melsens' idea, is a purely chemical one. It consists in determining the metal rendered insoluble by the formation of some albuminous compound to take on a soluble form by the creation of a double iodide removable *per viam urinariam*. Whether this is the case or whether its action consists in determining by destruction the evacuation of the morbid tissues containing the fixed metal, it is not the part of the committee to determine. It is sufficient that the author of this process has fully succeeded in diminishing the danger of certain mining and manufacturing operations.

## Sun-stroke.

Sun-stroke is rare on this coast, although last year and this a few cases have been reported. The heat is liable to return for brief intervals, and it would be well to know how to guard against prostration, or how to treat it if it comes. The Board of Health of New York city has collected some information upon this subject, in the form of a circular. Copies have been printed in English and German, which the *Tribune* says are to be circulated through the city very soon, especially among the laboring classes. The following is the principal part of the report:

Sun-stroke is caused by excessive heat, and especially if the weather is "muggy." It is more apt to occur on the second, third and fourth days of a heated term than on the first. Loss of sleep, worry, excitement, close sleeping room, debility, abuse of stimulants, predispose to it. It is more apt to attack those working in the sun, and especially between the hours of 11 o'clock in the forenoon and four o'clock in the afternoon. On hot days wear thin clothing. Have as cool sleeping rooms as possible. Avoid loss of sleep and all unnecessary fatigue. If working indoors, and where there is artificial heat—laundries, etc.—see that the room is well ventilated.

If working in the sun, wear a light hat (not black, as it absorbs the heat,) straw, etc., and put inside of it on the head a wet cloth or a large green leaf; frequently lift the hat from the head and see that the cloth is wet. Do not check perspiration, but drink what water you need to keep it up, as perspiration prevents the body from being overheated. Have, whenever possible, an additional shade, as a thin umbrella, when walking, a canvas or board cover when working in the sun. When much fatigued do not go to work, especially after 11 o'clock in the morning on very hot days, if the work is in the sun. If a feeling of fatigue, dizziness, headache or exhaustion occurs, cease work immediately. Lie down in a shady and cool place; apply cool cloths to and pour cold water over head and neck. If any one is overcome by the heat send immediately for the nearest good physician. While waiting for the physician give the person cool drinks of water, or cold black tea or cold coffee, if able to swallow. If the skin is hot and dry, sponge with, or pour cold water over the body and limbs, and apply to the head pounded ice, wrapped in a towel or other cloth. If there is no ice at hand keep a cold cloth on the head and pour cold water on it as on the body. If the person is pale, very faint and pulse feeble, let him imbibe ammonia for a few seconds, or give him a teaspoonful of aromatic spirits of ammonia, in two tablespoonfuls of water with a little sugar.

FASHIONABLE DINNER.—There can be little doubt that the very late dinner hour patronized by modern society is highly unnatural, undesirable, and pernicious. The fatigues undergone by fashionable folks during the day do not tend to whet appetite—rather they serve to blunt its cravings—besides, the stomach of such is unfitted from properly fulfilling its functions. Of course tempting viands are presented on the dining-table, prepared by practised and skillful cooks, while the pleasures of love, friendship, and social converse become added as incentives. All the more dangerous, we should say. It is possible to cloy the stomach, and yet derive no benefit therefrom, but contrariwise. Better be in the condition of the Cambridge students of yore, and "diet upon fasting every day" than cause the human system to receive more than it can digest. "I restrained myself," observes Bacon, "to so regular a diet as to eat flesh but once a day, and a little at a time, without salt or vinegar."

NEAR-SIGHTEDNESS FROM STUDY.—The result of trials made at Breslau, Vienna, Lucerne, St. Petersburg and other points would seem to indicate that near-sightedness is not congenital, as has been usually supposed, but is caused by, and increases steadily under the pressure of study. Recent examinations in the United States would seem to point to the same result, or at least coincide closely with European investigations to this end. A careful examination of the eyes of the freshman classes at Harvard, Amherst, Brooklyn Polytechnic and New York colleges shows the percentage of near-sightedness to be the same for each, or 29.5. Other examinations by experts are said to show the eyes of young children to be natural, but between the ages of six and 18, the percentage rapidly increases. From this Dr. Home, of Buffalo, reaches the conclusion that the tendency is increased by study, and that one pupil out of every four who is a graduate at a high school is made near-sighted for life.

#### TABLE OF CONTENTS.

**GENERAL EDITORIALS.**—The National Duplex Air Compressor; Quicksilver; Mining Patents, 17. The Week; Working Dry Placers; Dike on the Yuba, 24. Best & Belcher and Chollar; Delinquent Taxes on Mines; Rod Coupling for Borings; Wells; Eastern Mines; Items of Interest From the Mines, 25. Transportation of Fruit; Distinguished Botanists Coming; Unemployed Miners, 28. Mining Suits, 29.

**ILLUSTRATIONS.**—The National Duplex Air Compressor, 17. Holly and Magoon's Improved Cultivator, Coupler for Artesian Well Rods, 25.

**MECHANICAL PROGRESS.**—Steel Locomotive Boilers; The Protection of Cars Against Lightning; Oil Rats for Nail Manufacture; Russian Ship Raising; A Railway Pipe Driver; Iron Ship Building in the United States; Smokeless Furnace; Reducing the Production of Tin Plate, 19.

**SCIENTIFIC PROGRESS.**—The Shell Mounds, The Analysis of the Diamond; Electric Plant; Curious Phenomenon of Heat; Weather and Magnetism; Discovery of Native Mercury, 19.

**MINING STOCK MARKET.**—Sales at the San Francisco, Pacific and California stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 20.

**MINING SUMMARY.**—From the Various Counties of California, Nevada, Arizona and Colorado, 21-26.

**USEFUL INFORMATION.**—How Coffee is Adulterated; Crocodated Timber; Disinfectants; A Warning, 23.

**GOOD HEALTH.**—Treatment for Lead and Mercury Poisoning; Sun-stroke; Fashionable Dinner; Near Sightedness from study, 23.

**GENERAL NEWS ITEMS** on page 28 and other pages.

**MISCELLANEOUS.**—Hydrocarbon as Fuel; Pittsburg Mine; American Locomotives Abroad; Puddling with Culin; Pests for Beeswax; Fatal Flume Accident, Gold in Australia; Using Sparks, 18. Sebastian—A New Safety Dynamite; Kentucky Ridge Mine; "Slickers" a Great Benefit; Profits of Smelting in Utah; Extensive Development of the Yorkshire Coalfield; The World's Fair of 1873, 22. Aurora and Bodie Districts; Colorado and Poor Men, 23. Krupp's Works at Essen, 26. Meetings and Elections; New Incorporations, 29.

#### NEW ADVERTISEMENTS.

Drill Press, H. Bickford, Cincinnati, Ohio; Baker's Portable Pressure Blower, J. C. Sanderling, S. F.; Mining Claims in Montana, D. B. Noble, Shendani, M. T.; John Wiley & Sons, 15 Astor Place, N. Y.; Tarrant's Seltzer Penicillin; Delinquent Sale—Con. Bonanza Gold and Silver Mining Co.; Assessments—Washington Blue Gravel Co.; Excelsior Silver Mining Co.

#### The Week.

The week has brought news of no important developments in the mining regions or decisive fluctuations in the stock market. Since our last issue the largest single shipment of bullion ever made from the Comstock has been received.

It weighed nearly eight tons, and was valued at \$699,344. Of this amount, \$405,847 came from the California mine and \$293,911 from the Con. Virginia. In view of this evidence of prosperity, it certainly seems that the cry about hard times and the unproductiveness of mines is thoroughly unwarranted. Stock speculators are yearning for "a new bonanza," when sums like \$699,344 are sent down in a single shipment from an old one. However, that belongs to one set of people, and the new ones would probably enrich others.

The state of affairs on the Comstock is not very encouraging, to say the least, and the laboring class particularly feel the lack of employment. In another column we give an account of this matter and the generous way in which some of the difficulties are overcome.

Our "Mining Summary" gives all the latest news from the mines on different parts of the coast. The gravel mines are gradually closing down for the season and cleaning up. Quartz mines of course are being worked ahead with varying degrees of success.

We hope soon to hear of more activity on the Comstock, so that the many unemployed miners may once again have all the work they want.

The Krom concentrator at the Manhattan works will shortly be started up.

The water in the Carson river is very low.

#### Working Dry Placers.

For many years most experiments have been made with a view to economically work the numerous dry placers which abound in Arizona, New Mexico, and the States of Sonora and Chihuahua, Mexico, but until the recent introduction of George Ginn's machine, which substitutes air for water, the thousands of acres of arid gulch, mesa and gravel hill deposits have remained unworked, save during the rainy season, which occurs during the months of July and August.

The machine referred to is about six feet long, six feet high, and two feet wide, and has a vibrator frame consisting of three screens and three tables, suspended from the beams, which unite the four posts which form the corner braces. The screens or sieves, whose meshes vary in degrees of fineness, are placed directly and obliquely above each other in the upper half of the machine, while immediately beneath are placed the rawhide tables, each of which has a series of riffles, on which the gold and iron-sand lodge. The sand, gravel, and clay which carries the gold is fed on the upper and coarsest screen, and passes thence to the second and third screens in succession, and while falling from the last mentioned, the auriferous earth encounters a blast of air from a No. 2 Sturtevant blower, run at speed of 800 revolutions per minute. This blows out the sand and permits the iron-sand and gold to settle on the riffles, from whence it is taken and washed.

This machine, the result of two and a half years' thorough and numerous experiments, was founded upon the fact that a body is acted upon by air in proportion to the surface which it presents, and the additional fact that the gold, being from eight to twenty times as heavy as the gangue in which it is found, will fall against the riffles, while the lighter material will be blown away. In fine, it is resolved into a question of specific gravity.

This appliance has been thoroughly tried, and is now daily at work at the Jacarilla placers, in New Mexico, and has created quite an excitement there. A correspondent writes us from there and says he has seen \$8.50 in gold taken from it after a run of 16 minutes from dirt which washed 10 cents to the pan, and the machine will handle from 30 to 40 cubic feet of earth per day of 10 hours. Mr. Ginn, the patentee of the machine, was formerly a resident of Belmont, Nevada, and "the boys" will be glad to hear that he has at last achieved a triumph which bids fair to make the fortunes of others as well as himself, for it will enable the owners of placers destitute of water to work them with profit. Mr. Ginn is still at Jacarilla, and his partner, Mr. Hatch, will soon visit Prescott, Arizona, so that the miners there can witness the working of the machine. It is necessary, in using this appliance, that the earth must be perfectly dry before it can be worked, but in the countries where these rich dry placers occur the dampest earth can be dried in a few minutes in the sun, when it is properly spread out. It seems probable that this machine will revolutionize the present method of working the dry placers, and render available for mining large tracts of land known to be valuable, but heretofore unworked for want of proper appliances. It is claimed that the machine is perfectly satisfactory in its working in every respect, and that the miners are well pleased with it. As there are many of our readers who are interested in an appliance of this kind, it may be well to mention the names of a few prominent persons who have seen it work, and who may be applied to. Among them are Hon. H. M. Atkinson, Surveyor-General of New Mexico, Capt. Purington, 15th U. S. Infantry, Fort Stanton, and Mr. Markley, editor *Trinidad Chronicle and Enterprise*, Colorado. The machine will be of great value to New Mexico, where there are so many dry placers; and there are many other localities where it might be introduced to advantage.

**MECHANICS' FAIR.**—Those who intend making exhibits at the Mechanics' Institute fair, which opens on the 7th of August, have no time to lose in making their preparations. We urge upon our mechanics and manufacturers the advisability of making as good a show as possible, so as to bring our home manufactures before the public in a practical shape. These exhibitions are of great value to our industrial interests and should be encouraged in every possible way.

**ADMITTED TO THE SUPREME COURT.**—A class of four, after undergoing a satisfactory examination, have been admitted to practice in the Supreme Court of this State. The class consisted of Chas. F. Hanlon, Wm. Thomas, John L. Boone (of the MINING AND SCIENTIFIC PRESS Patent Agency), and J. A. Cooper.

The *Daily Stock Report*, which has recently moved its office down among the brokers on Leidesdorff street, has made its appearance in a brand new suit of type. The paper has been enlarged and presents a much improved typographical appearance.

The Baker rotary pressure blower is a very useful appliance for furnishing blasts to furnaces, etc., and may be used to great advantage in ventilating mines. The agents in this city are prepared to furnish these blowers of any size to suit requirements.

#### Dike on the Yuba.

Rescuing the Alluvial Bottoms from the Hydraulic Tailings.

An important work has lately been completed in Linda township, Yuba county, consisting of an extensive and costly levee or dike, designed to secure a large scope of valuable farming land from threatened inundation by hydraulic tailings. This dike commences at the Yuba station, on the California and Oregon railroad, being a little south of and nearly opposite the city of Marysville, and extends thence east along the south bank of the Yuba river to the foothills, a distance of eight miles. The country protected by it lies south of the Yuba, between it and Bear river, and comprises some 30,000 acres of rich alluvial bottoms.

In no part of the State has the damage to the agricultural lands, resulting from this cause, been so great as along the Yuba, the bottoms here being low-lying and extensive, while the quantity of debris brought down by this stream has been very great. Poured out from the hydraulic mines in enormous quantity, these tailings had so accumulated in the channel of the main Yuba as to raise it many feet above its original level. Being so filled up, the muddy water during floods, or even moderately high stages, escaping from the river bed, overflowed the adjacent flats and deposited thereon the comminuted sand and particles of clay held in solution; a process that being repeated year after year had covered up to a depth varying from a few inches to several feet, some 15,000 or 16,000 acres of good land, the most of it lying on the north side of the river.

#### Only a Temporary Harm.

This debris brought down from the mines being rich in plant-feeding properties, would have benefited instead of injuring this land, could it have been applied in suitable quantities, and in the proper manner. Pouring in, however, as it did, at unreasonable times and in excessive quantities, it not only interfered with farming operations here, but rendered them, at last, wholly impracticable. These sedimentary deposits do not, however, prove irretrievably hurtful to the soil. When they shall have so accumulated as to raise the surface of this land above their further reach, it will again be susceptible of cultivation; these bottoms having in the first place been made up of this same sort of material, brought down and left by former floods. As some, and perhaps many, years will be required to so reclaim these lands, and thus restore them to usefulness, the owners, through their non-enjoyment, must meantime suffer loss; and it is of this they complain, alleging that for every injury the law ought to afford a sure and sufficient remedy. Hence the numerous suits brought by the farmers owning land along Bear river and elsewhere in the State, seeking to recover damages for this sort of injury.

#### The Farmers Move in the Matter.

Having hurried up most of the flats lying north of the river, these tailings were about to invade this tract of alluvial country on the opposite side, the site of many fine farms, the most of which had, up till last summer, escaped inundation. With another flood, however, such as frequently happens on these mountain streams, and as there was reason to expect would occur the past winter, this large area of valuable land would, in all probability, have been covered up and temporarily ruined.

The owners, alarmed at this prospect, proceeded during the summer to organize the same into a levee district, after which they procured a survey for the line of a dike, with estimates of its probable cost to be made. This done, the cost of the contemplated work would, it was found, greatly exceed their means, necessitating the abandonment of the project or the procuring of assistance from some other quarter.

#### The Miners Come to Their Relief.

In this emergency, recourse was had to Messrs. Pierce, O'Brien and McCanney, owners in the Smartsville and other hydraulic properties, and who, from their liberal views, well-known energy and large experience, it was thought, might with their counsel, if not with more substantial aid, be of service to these parties, application having meantime been made to the county authorities for such assistance as they might see fit to render. The above gentlemen, though not more interested in the scheme than many other mine and ditch owners, perceiving the strait the farmers were in and the importance of the proposed improvement, concluded to take hold and put the work though on their own responsibility, trusting to such assistance as might be obtained from the county, the farmers themselves and their fellow miners to help them out; it being now too late in the season for them to stop and ascertain exactly how much these several parties would contribute towards defraying the entire cost, which it was estimated would amount to about \$30,000.

#### James O'Brien,

One of the three gentlemen mentioned, having arranged with his associates, Messrs. Pierce and McCanney, to execute the job, commenced active operations in the month of September, and putting on a large force of men and teams, would have finished the embankment before the advent of winter had not the heavy and wholly unex-

pected rains of October interfered with the progress of the work, the cost of which was at the same time largely increased. Mr. O'Brien, who even among the hydraulic miners is noted for push and pluck, kept his force in the field, losing scarcely a day during all this inclement weather, thereby finishing the structure in the early part of the year.

#### The Dimensions of this Levee

Are as follows: Length, eight miles; breadth on top, 12 feet for about three-fourths of the length and 20 feet for the balance, with a slope of two to one on the inner and three to one on the water side; height, five feet above extreme flood-line. Through the embankment six large iron pipes with gates have been laid, to admit the escape of any water that may accumulate on the inner side. The outer face of the dike for a distance of two miles has been covered with a lining of willows, to prevent its being washed away at high stages of water, another mile having for the same reason been protected by substantial brush fence. This dike contains about 200,000 cubic yards of embankment, the greater portion of it composed of the red soil common to the country, and which, when thrown up, as the most of this has been, in a wet state, hardens almost to the consistency of a brick, enabling it to well withstand the action of water. Such sections of the dike as are composed largely of mining debris, a sandy material, have been protected by the facing and fence of willows mentioned. Many of these willows will, it is expected, take root and thus very effectually guard the embankment against wash or other cause of abrasion.

#### The Good Already Done.

Notwithstanding the past winter proved a dry one, this levee has already effected much good. The farmers feeling that their land was through its protection secured against the further inroads of the mud-laden waters, went on and planted a considerable portion of it to grain, fine crops having been gathered this summer from fields before neglected, either through fear of overflow or because they were too wet for tillage. Hereafter the whole of the land defended by this dike will no doubt be kept under the plow and made to yield good crops, as the soil is everywhere rich and susceptible of culture.

As this levee stands back some distance from the bank of the river, a large area has been provided for the reception of the hydraulic tailings, it being calculated that it will require many years to fill it up. When these tailings, accumulating, shall have nearly reached the top of the embankment, it will be an easy matter to raise it somewhat higher, increasing in like ratio the capacity of this receptacle.

#### A Plan Worth Considering.

A number of experienced civil engineers, practical miners, and other competent judges have examined this levee, and, besides speaking approvingly of the manner in which it has been constructed, express the opinion that it will fully meet the requirements expected of it. This being the case, we do not see why recourse might not be had to similar structures for the protection of farm lands elsewhere exposed to the invasion of this troublesome material. The injury caused to the bottoms along Bear, Feather and some other rivers in the State is already quite serious, and unless checked must go on increasing every year. To suffer this cause to continue in active operation must eventually lead to very grave consequences. How it shall be stopped is a problem, the solution of which has for some time exercised the ingenuity of our best mining engineers, the most of whom we believe consider this method of diking the river banks the most feasible.

#### A Bad Way.

The farmers, in some instances, have sought relief against these grievances in the courts, there being now a large number of suits of this kind pending against the hydraulic miners throughout the scope of country drained by Bear river. How these suits will terminate cannot, of course, be predicted; though, judging from the rulings of the court in some of the cases now on and the results in others already tried, the outlook is rather ominous for the farmers.

Litigation is at best, however, a poor way of settling these disputes, and we cannot help thinking the plan that has been adopted in the instance under consideration is by far the best, and, as such, we commend it to the attention of parties interested in this subject. The course taken by the miners in this case has, it is believed, had the effect to estop many lawsuits that would otherwise have been commenced against them, and the cost and bother of which would have greatly exceeded the money donated by them for this beneficial improvement. It is to these men a saving of money and a monument of honor.

The miners on the Yuba have acted nobly in this matter, having already paid in or made themselves answerable for more than \$30,000 towards the cost of this improvement, Yuba county having contributed \$10,000, and the owners of the land benefited \$7,000 towards making up the amount expended upon it, the total having reached nearly \$50,000. There are still a number of hydraulic miners interested in this enterprise, who have not as yet contributed anything towards defraying its cost. To their credit be it said, however, they are all willing to stand in and bear a fair share of the expense when called upon to do so; at least this is what we gather from the reports that reach us from the mines and from conversations had with some of these parties.

## Best &amp; Belcher and Chollar.

The annual meetings of the Best & Belcher and Chollar-Potosi mining companies were held this week. The total receipts of the Chollar for the past year amounted to \$1,047,653.52, of which the chief items are: \$710,941 from bullion, \$196,202 from assessments, \$100,000 borrowed from Mr. Livingstone and \$33,661 overdraft at the Bank of California. The chief disbursements were: \$420,153 for the redemption of ore, \$190,494.69 for mine labor, \$185,469 for Chollar-Norcross-Savage shaft, \$71,500 for interest and discount and \$75,881 paid overdraft from last year.

The Secretary's report of the Best & Belcher showed a deficiency of \$58,182, which will no doubt necessitate another assessment.

The Superintendent, F. F. Osbiston, gives a lengthy account of the work of the past year, from which we condense as follows: On the south station (1167-foot level), the lateral drift running north from the Gould & Curry shaft through our mine, and connecting with the upper stopes of the Con. Virginia, has been reopened and retimbered the entire length of the mine and will, in the course of a week or two, be completed to the Con. Virginia shaft. When this is done there will be a good circulation of air and we will be in position to cross-cut. By referring to the map accompanying this report you will see that very little cross-cutting has been done on this level, and, judging from the character of the ground passed through in the lateral drift, the chances of finding ore appear to me to be good. We could not get at this work before on account of the whole drift being caved and in a wretched condition, but now that the Con. Virginia has expended so much time and money on this, to us, valuable piece of work, we will be able to use it for prospecting this level thoroughly.

I am satisfied the water tapped, both in Gould & Curry cross-cut and our No. 3, comes from the same vein that was cut in the 1500-foot level east drift, and which contained ore, and I therefore consider our chances for finding ore in the 1700-foot level most encouraging.

It was necessary during the first part of the past year to run a large exhaust fan on the surface for the purpose of drawing out the hot air from our drifts, but for the last three months the Gould & Curry shaft having become a down-cast shaft, it has been unnecessary to run the exhaust fan, which is a great saving to the company. The mine is now in fine condition to do an immense amount of prospecting cheaply.

The air in the north and south drifts on each level is perfectly cool. During the coming year I would suggest that in addition to opening the 1700 and 1900-foot levels, a thorough prospecting of the 1200 and 1500-foot levels, as it is now practicable to do so. I repeat, that in my opinion, our prospects are most encouraging, and that early in the coming year important and valuable developments will be made.

## Delinquent Taxes on Mines.

The District Attorney of Storey county, Nev., has discovered that a number of the mining companies, owning mines within the county, are delinquent in the aggregate of nearly \$1,000,000 for taxes. The exact sum of the principal is \$942,401.02, whereof \$851,867.27 is due in gold, and \$90,533.75 in greenbacks. Add the accrued interest to the principal and the sum will exceed \$1,000,000 in gold. Payment was refused on the assumption that, as the mines belong to the United States, their production in bullion is not taxable by act of the State Legislature. A late decision of the United States Supreme Court has overthrown this assumption, and the District Attorney is confident that the whole amount can be collected. The whole number of suits to be brought will be about 100. These back taxes delinquent are from 1869 to 1875. The *Enterprise* gives the following list of mines and amounts, payable in gold: American mining company, \$125.49; Andes, \$32.85; Bacon, \$460.39; Belcher, \$295,214.53; Brophy, \$41.19; Bowers, \$17.25; Chollar, \$63,425.60; Crown Point, \$219,561.64; Caledonia, \$1,173.20; Challenge, \$31.21; Consolidated Virginia, \$172.746.11; Empire, \$2,457.99; Gould & Curry, \$6,650.08; Gold Hill Quartz, \$10.67; Hale & Norcross, \$26,939.76; Hartford, \$36.95; Imperial, \$312.01; Justice, \$196.29; Kentuck, \$6,662.20; Luzerne, \$113.49; Lady Bryan, \$42.13; Mides, \$22.43; Ophir, \$10,877.63; Overman, \$547.53; Occidental, \$23.12; Savage, \$19,226.45; Segregated Belcher, \$277.55; Suecor, \$956.27; Sierra Nevada, \$1,369.55; Silver Hill, \$472.35; Vivian, \$46.79; Woodville, \$466.48; Yellow Jacket, \$21,377.04. Total, \$851,867.27. Amounts payable in currency: Savage, \$37,016.22; Chollar-Potosi, \$8,489.81; Crown Point, \$10,706.16; Kentuck, \$14,617.82; Yellow Jacket, \$3,494.82; Burke & Hamilton, \$103.53; Bacon mill and mining company, \$1,072.56; Confidence, \$147.29; Empire mill and mining company, \$467.97; Eclipse, \$256.11; Gold Hill Quartz, \$251.48; Gould & Curry, \$1,067.88; Hale & Norcross, \$4,517.59; Imperial, \$2,064.09; Overman, \$629.91; Ophir, \$46.34; Winters & Kustel, \$219.38; J. B. Winter, \$175.48; and others, making a total of \$90,533.74.

The diamond drill is again running in cross-cut No. 3 of the Best & Belcher mine.

## An Improved Cultivator.

We illustrate on this page a California invention, which seems worthy of the attention of users of agricultural implements. It is an improved cultivator, for which letters patent have been obtained by John Jones, of Stony Point, Sonoma county, through Dewey & Co.'s Agency. Mr. Jones has disposed of the controlling share in his invention to Messrs. Sidney B. Holly and William H. Magoon, of Stony Point, and these gentlemen are engaged in bringing the cultivator to the attention of the farmer. The cultivators may be seen at Marcus C. Hawley & Co.'s store on Market street. Our engraving gives a good view of the implement. As may be seen, Mr. Jones's invention is an improvement which consists in a novel combination of levers for enabling the driver to raise and lower the frame and plows or teeth without leaving his seat, all as hereinafter described.

In the engraving, A and B represent the two diverging timbers or beams of a V-shaped plow or cultivator. The plows or cultivator teeth, C C C, are secured to the standards d d d, while the upper ends of the standards are secured to the beams in the ordinary way. The rear ends of the beams are supported upon an axle, D, which is cranked at both ends, and upon the journal formed by each crank is a hearing-wheel, E.

A strong beam, F, has its rear end firmly secured between the two forward ends of the

HOLLY &amp; MAGOON'S IMPROVED CULTIVATOR.

timbers A B, so that it will project forward a short distance in advance of the frame and front plow, similar to the beam of a single plow. A hole is made through this beam, through which the vertical spindle g of the front or swivel wheel H passes. The forward end of this beam or short pole is turned upward, so as to form a standard, I, and is provided with holes for the attachment of the clevis or whiffletrees, as represented. To provide for raising and lowering the frame and plows, the angle of a bent lever is attached to the upper end of the standard I. The short arm, O, of this lever extends upward, and its extremity is connected with the extremity of an arm, K, which pro-

COUPLER FOR ARTESIAN WELL RODS.

jects from the rear axle, D, at a right angle to the cranks upon which the wheels are carried by means of a connecting rod, J, which passes back over the frame and under the driver's seat. The long arm p of the bent lever extends directly back through a rack, L, near the driver's seat, so that it can be easily grasped by the driver. The upper end of the vertical spindle g of the steering wheel is connected with the long arm p of the lever near the fulcrum by means of a link, m, so that the movement of said lever operates to rotate the rear axle about its cranks and raises or lowers the beam F on the spindle g.

When the frame is to be lowered, the driver frees the lever arm p from the rack and raises it, thus dropping the beam F on the spindle, and, through the arms O K and rod J, turns the crank axle so as to lower the rear end correspondingly. A reverse or downward motion of the lever transfers the fulcrum of the lever arm p from the standard I to the upper end of the spindle g, and rotates the crank axle in an opposite direction, thus lifting both the frame

and plows out of and above the ground.

This arrangement of levers is very simple and convenient, and the power of the driver is applied at the best possible advantage.

Thus the teeth may be drawn up and a corner turned with perfect ease, while in the old machines the frame was racked with the side draft, and the cultivator apt to turn over at the corners.

These implements have had a year's trial both in sandy and adobe soils and the inventors are full of assurance of their value. The soil is perfectly worked by them. There are three sizes made for three, four and six horses.

## Rod Coupling for Boring Wells.

We illustrate on this page an improved coupling for connecting such rods as are used in boring artesian wells. It can also be used for connecting other tubes and rods where great strength is required and rapidity in connecting and disconnecting the pipes or tubes is desirable.

This improved coupling consists of two interlocking parts. Each rod or tube to be connected together is provided with an extension like that shown, the upper ends being fitted with one kind and the lower with the other, as shown, in the usual manner of providing rods or tubes with male and female couplings. These two parts are slipped together and a hand of iron slipped down over the end until it rests on the

shoulder, as shown, thus firmly securing the two extensions together and coupling the two rods. The device is so simple that no extended description is necessary, the engraving showing the operation clearly.

There is no weld except in the hand which secures the parts in position when coupled. This hand is so made as to slide easily from its secured position upward, thereby allowing the lower half to be removed from the upper part. One part is constructed with a slight bend, as represented, so as to bring the bearing on a direct line with the other bar. It will be seen that the elbow or hook is nicely fitted to the hole in the other bar; it is also designed that the shoulder and hook or elbow shall equally share the weight of whatever may be above them when coupled together, thereby greatly diminishing the wear when pumping or drilling. When necessary, the band is secured in position by drawing a key through a small hole made for the purpose. Any one who has ever had anything to do with coupling the rods together in boring, will see the value of this little device, which was patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by Theodore D. Culter, of Westminster, Los Angeles county, who may be addressed for further particulars.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: Con. Virginia, July 3d, \$263,911.18—total to date, \$867,827; Northern Belle, 3d, \$9,820; Empire (G. V.), 3d, \$14,500. Tyho Con., 5th, \$4,409.28—total to date, \$8,806.93; Northern Belle, 5th, \$7,706.13; Standard, 5th, \$23,221.67—total for June, \$49,534.43; California, 7th, \$66,386.55, first shipment for July; Con. Virginia, 7th, \$212,999.78—total to date, \$1,080,827.12; Washington, (Cal.) 4th, 242 ounces gold bullion; Grand Prize, 7th, \$7,300; Tyho Con., 7th, \$3,683—total to date, \$17,490; Leopard, 8th, \$3,600; Modoc, 2d, \$3,735; on the 6th, \$4,188; on the 8th, \$4,324—total to date, \$12,298.

The Board of Supervisors have finally passed a resolution granting J. S. Kohn and others a franchise to run an elevated railroad from Valencia and 26th street, along 26th street to Bryant, and thence out the Western Addition to the ocean. There will be now a practical opportunity to test the merits of the prismoidal railroad under the immediate observation of our citizens.

INFORMATION is received of the death of Prof. S. Tenny, of Williams College, while he was visiting a sister in Michigan. This will probably break up the Williams Scientific Expedition, of which he had charge.

CHOLLAR-POTOSI produced \$24,626 in June; California, \$1,567,931; Idaho (Grass Valley), \$38,246; New Coso, \$70,064, and Tyho Con., \$107,573.

## Eastern Mines.

Every now and then we hear of wonderful mineral discoveries in some one of the States to the east of the Rocky mountains, which, judging by the way they are usually referred to in the dispatches, seem likely to eclipse anything previously found. The latest instance of this kind has occurred at Milan, New Hampshire, where, according to the dispatches, "an enormous lode of copper, lead, gold and silver, 20 feet in width, has recently been discovered. The lode crosses the Grand Trunk railroad, 100 miles west of Portland."

One peculiarity worthy of note in these remarkable discoveries is, that the miners do not seem satisfied with the discovery of one kind of ore at once, but usually manage to unearth half a dozen kinds in one lode. Another feature is, that the lode is always large; and still another, that after a little while nothing is heard of the magnificent find. There are some excitable persons in the world, and a good many of them, too, who think if they ever strike a lode that they are going to make their fortune in a day. As a general thing these people may be set down as having very little experience in mining, although some old miners are just as bad. But this tendency to exaggerate the importance of new discoveries which have not even been prospected is not confined to any particular locality. Scarcely a month passes that we do not hear of a find on this coast somewhere that is going to equal or excel the Comstock. Whenever a prospector finds a big pile of croppings he thinks he has got a second Comstock. This happens more frequently in some of the newer districts of course, for intelligent miners know that a Comstock is not struck very often and moreover it takes a good many years to prove up a thing of that kind.

Our Eastern friends, however, seem to think that if they find any mineral indications at all they have something richer than anything ever found before, and immediately herald it abroad and proceed to get up a company to work "the mine." If they knew enough about the matter to only find one or two metals in the ledges it would take better; but when they have gold, silver, copper, lead, tin, etc., all at once, anybody who knows anything is apt to fight shy of the undertaking. As long as they stick to coal and iron hack there they will do very well, but the precious metals are peculiarly the province of the Pacific coast, and what few gold mines there are in one or two of the Southern States make small showings when compared with what we have out here.

## Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective Superintendents on file at the offices in this city:

The average assays from drift No. 3 of the Eudowment are \$188 per ton.

The De Fries company expect to have their steam hoisting works up in a few days, when they will quickly have a quantity of good milling ore on the surface.

The water is now all out of the North Con. Virginia mine.

The mill started up on Alps ore on the 7th. The air engine has been placed in the Utah mine.

South lateral drift from the 1900-foot level of the Ophir has been started with Burleigh drill. The Grand Prize mill is nearly completed.

Last week's operations at the Chollar showed 606 tons of ore extracted, assaying \$22.50 per ton.

In the Justice the winze and upraise on the 1000-foot level continue to look bright at the latter point; the ore body shows great strength; the stopes on either side of the upraise are developing a continuance of the same well defined vein and equally as productive.

The ore in the face of the Electric tunnel improves as they go in.

The Coso Consolidated stopes continue to yield good ore.

The section of incline in the Hale & Norcross above the 1900-foot level, including the 1900-foot station, which required retimbering, has been completed.

In the Eureka Consolidated the ore bodies continue to look encouraging and hold out well. The 5th level ore body is looking first rate and increasing in yield as developments extend. The connection between 5th and 6th levels is completed and in ore all the way.

The Con. Virginia letter says: "On the 1300-foot level from our shaft the south drift has been extended 25 feet; total length 479 feet; 30 feet yet to run to reach the south winze, which connects with the level above. This will give us a fine volume of air and enable us to reach all the southern ore breasts from the 1300-foot level up. On the 1400-foot level the ore breasts continue to look excellent. On the 1650-foot level the ore breasts continue to look very favorable. The south drift in the east ore body is connected with the east drift from the deep winze and it has much improved our ventilation. The ore is good in these drifts throughout. The south drift will be continued south in the ore body. The west ore body is widening as we work south."

## Krupp's Works at Essen.

Apart from the steel works of the Messrs. Krupp, the town of Essen, in Prussia, has very little interest for the traveler. As all the importance of Stratford-on-Avon is derived from the accidental circumstance that Shakespeare was born there, so all the interest that centers around Essen arises from the fact that it is the location of this remarkable steel-producing establishment. It is not always that the visitor can obtain an order of inspection, but very fortunately Dr. Edward Young, chief of the United States Bureau of Statistics, was able to do so some few years ago, and has given a record of what he saw in his admirable work entitled "Lahor and Capital in Europe," published by Messrs. Truhner & Co., of Ludgate Hill. The population of Essen consists of some 52,000 inhabitants, nearly all of whom, directly or indirectly, derive their means of livelihood from these works. The number of men actually employed in the works at Essen is 12,000, and in coal mining, etc., 5,000. The cast-steel produced last year was 125,000 tons. The whole value of steel, steel guns, shafts, tires, rails, wheels, axles, etc., produced in 1871, was 12,000,000 thalers; the iron and iron-ore used was 200,000,000 pounds; the coal used per day was 30,000 centner, or nearly 500,000 tons per annum. The coal now costs 24 thalers per 100 centner, five tons, or nearly 2,400,000 thalers. The number of crucibles used per day is 5,000; the total cost of coal per annum is 250,000 thalers; and the total cost of labor is 5,000,000 thalers. The wages of the men average 13 thalers per day, but the wages are regulated according to the skill of the work-people—those in the forging and finishing shops receiving the highest pay. The unskilled workmen only receive four thalers per week, though how they contrive to keep body and soul from dividing upon this payment is a problem which it would puzzle an economist to solve. The number of hours worked per day is 11, and the works are continually going. To increase their earnings many of the men work extra hours, and even on Sundays. We should be very sorry indeed to see English workmen paid so badly as to render the temptation to work on Sundays so great. At the end of the year Mr. Krupp distributes a large amount in benefactions, and these, like the weekly wages, are regulated according to the results. Workmen when sick get half wages, and are cared for in hospitals without cost. The firm contributes one-half as much as the aggregate contributions of the men. Mr. Krupp is building houses for his work-people, and in a variety of ways evidences his interest in their welfare. Speaking of the quality of the steel, Dr. Young says: "With regard to the soundness and good quality of the steel castings made in this establishment, they appear to be entirely faultless. I saw immense guns, nearly completed, intended for exhibition at Vienna next year; an immense shaft for a steamship of one of the German lines to New York, which seemed the very perfection of workmanship, and for which one thaler per lb. was to be paid; and great numbers of other manufactures of steel, either completed or in progress, all of which appeared to possess great excellence. In regard to tools, machinery, and appointments, these works do not, in my opinion, surpass in excellence those of the steel works of Messrs. Firth & Sons, of Sheffield. But as the products have obtained a higher reputation than those of any other manufacturer, how is this admitted excellence obtained? No doubt it is in part due to the analyses of the various ores from his mines in Germany and Spain, and from Great Britain and other countries, and from experiments made by the experienced and analytical chemists in his employ. But, in my opinion—the opinion of an inexperienced metallurgist and mechanical engineering—this firm has no secrets in regard to the admixture of various kinds of iron which, if known, would enable manufacturers to produce as good steel. The superiority is, I believe, owing to the following causes: Most of his workmen have been for a long time in his employ, and have great experience and skill; his foremen thoroughly understand their business, possess technical training, and practical knowledge. These are all attached to the proprietor by his practice of giving extra pay for skilled work, by his annual gratuities, by his generosity exhibited toward the men in every possible way, and his sympathy with them. His workmen are thus warmly attached to him, and strive to promote his interest by performing their several duties thoroughly and well. In the reputation of the establishment for excellence of workmanship, they are, therefore, interested." The works were established by Mr. F. Krupp in 1810, who died when the present Alfred Krupp was little more than 14 years of age. Leaving school, he seems to have continued the works on a very small scale at first, but gradually the quality of the work turned out brought the name of Krupp into repute, so that to-day anything that leaves his works is regarded as little short of perfection. The works have been so developed that at this time they cover a continuous area of more than 4,784,000 square yards, of which about 900,000 square yards are covered in. It must be evident from the circumstances under which the present Mr. Krupp took possession of the works that he is a man of no ordinary talent and business energy. Even since Dr. Young visited the works they have been developed still further, and it is impossible to predict what their ultimate dimensions will be.—*Mining World.*

## DEWEY &amp; CO.

American & Foreign Patent Agents  
OFFICE, 224 SANSOME STREET, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

## Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

## Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

## Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

## Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## DEWEY &amp; CO.

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 224 Sansome St., S. F.

## Superior Pianos for the People at Popular Cash Prices.

More than TEN THOUSAND prosperous families on this Coast need Ten Thousand GOLDEN PIANOS to make TEN THOUSAND HOMES MORE PLEASANT AND ATTRACTIVE.

Prices of good Pianos have long been too high. Our people could not afford to buy them. But many will find it not only pleasant but profitable to purchase

## The Brilliant and Durable GOLDEN PIANO

Which we now offer the readers of this paper

## At Greatly Reduced Popular Cash Prices.

We Guarantee them to be as represented, of superior tone, finish and durability.

Samples can be seen by calling at this office. We keep no expensive sales-rooms and attendants.

We shall sell none but superior and desirable instruments, but give our customers the benefit of prices far below any before offered on this side of the Continent.

## Prices of the Golden Piano:

	The Installment Plan Prices.	Our Reduced Cash Price.
The Golden Piano, \$500	\$350	
(UPRIGHT—C.)		
The Golden Piano, \$375	\$300	
(SQUARE—No. 1.)		
The Golden Piano, \$500	\$350	
(SQUARE—No. 2.)		
The Golden Piano, \$600	\$400	
(SQUARE—No. 3.)		
The Golden Piano, \$800	\$450	
(SQUARE—No. 4.)		

We invite our readers who wish to look at Pianos for themselves or friends, for immediate or future purchase, to call and examine our samples.

Those who cannot call will be given further information by consulting our agents or sending to this office.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,  
MINING ENGINEER AND METALLURIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

## ARITHMETIC MADE EASY.

ROPP'S

## EASY CALCULATOR

Is a new publication that must prove of incalculable benefit to Farmers, Mechanics and Business Men. It is so rapid and original as to startle the most scholarly, and yet so simple and practical that the most illiterate in figures can instantaneously become his own accountant. It enables thousands to accomplish in a minute what they could not learn to calculate in many months.

The first part contains an entirely new system of tables, which show at a glance the exact value of all kinds of Grain, Stock, Hay, Coal, Lumber, Merchandise, etc.; from one pound up to a car load, and for any price that the market is likely to reach; the Interest on any sum for any time at 6, 7, 8 and 10 per cent.; correct measurement of all kinds of Lumber, Saw Logs, Cisterns, Tanks, Granaries, Bins, Wagon Beds, Corn Cribbs; a Time, Wages and many other valuable tables.

The second part is a practical arithmetic, and embodies a simple mechanical principle which enables any one familiar with the fundamental rules to become a lightning calculator; and by which over two-thirds of the figures and labor required by the ordinary methods, and fractions with their intricacies, are entirely avoided.

The work is nicely printed on fine tinted paper, is well and elegantly bound in pocket-book shape and is accompanied by a Silicate Slate, Memorandum and Pocket for papers. It is by far the most complete, comprehensive and convenient pocket manual ever published.

Price, bound in Fine English Cloth, \$1.00.

Sent direct from the Eastern publisher, postpaid, on receipt of price, by P. O. order, registered letter, or receipted by express. Address

DEWEY & CO., San Francisco.

## Buy the Best.

Before purchasing an American Watch, examine the different styles manufactured by the NEW YORK WATCH COMPANY, at Springfield, Mass. They are the latest and best improved manufacture. You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in fact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

DEWEY & JORDAN, Agents,  
433 Montgomery St., S. F.

## Mining and Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

DEWEY & CO., Publishers, S. F.

50 FINE CARDS, Damask, Repp, Etc., with name on 13 cents. CLINTON BROS., Clintonville, Conn.

 ples for 3c. stamp. M. DOWD & CO., Bristol, Ct.

## TULLOCH'S AUTOMATIC ORE FEEDER,

Awarded the Centennial Medal.

The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in  
 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is  
 so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop  
 regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an  
 automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each back-  
 ward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical  
 mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these  
 testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of  
 the parties certifying to those herewith given, will establish their value and genuineness.

Mr. Jas. O. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I con-  
 sider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no  
 man living can feed a battery as well; they save us in labor alone \$48 a day. Mr. Green, of the Phoenix mill (12),  
 Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use  
 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are  
 running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar  
 since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripe companies, Plumas county, writes:  
 From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage  
 them; the saving in both labor and castings is fully one-half over the old style of feeding by hand. Mr. Preston  
 writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have  
 ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet  
 or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

F. OGDEN, 413 California Street, S. F.

## Rand's Rock Drill.

Its use in mines brings about

- 1.—Decreased cost of ore.
- 2.—Increased output of ore in a given area of working ground.
- 3.—Decreased number of men employed, consequently saving large permanent in-  
 vestments in houses for men when an increased production is desired.

Testimonials, Circulars and Price Lists, illustrative of the most recent improvements in this  
 class of machines, will be cheerfully furnished on application to the

RAND AND WARING DRILL AND COMPRESSOR COMPANY,

21 Park Row, opposite New Post Office, New York.

CAUTION  
TO HYDRAULIC MINERS.

All persons, excepting those having the right by pur-  
 chase from me, are hereby cautioned against using, or  
 making, or selling any device for turning the discharge  
 pipes of hydraulic machines which uses the deflecting  
 force of the stream of water.

Any such device is an infringement of United States  
 Letters Patent, granted to me on the 16th of May, 1876,  
 and re-issued September 19th, 1876.

I have commenced suit against Richard Hoskin for in-  
 fringing my said patent, and intend to prosecute all par-  
 ties using such Defectors without license from me, there  
 being no other way to protect my rights.

Any parties wishing to purchase the right to use this  
 device can do so by making application to me.

HENRY C. PERKINS,

North Bloomfield, Nevada County, Cal.

GUIDO KUSTEL,  
 MINING ENGINEER and METALLURGIST.

P. O. Address: ALANEDA, CAL.

SCIENTIFIC PRESS.—As the old year is drawing to a close  
 and the new is rapidly approaching, all our mining  
 friends should subscribe for this scientific journal, espe-  
 cially devoted to their interests. It is a California enter-  
 prise, and compares favorably with similar organs of  
 years more experience and age in the old countries.—  
 Colfax Enterprise.

\$55 & \$77 a Week to Agents. \$10 Outfit Free,  
 P. O. VICKERY, Augusta, Maine.

## Continued from Page 21.

being reduced at the Leonard mill. The workmen will be paid up, for the past month, next week.

FRANK HUNT and Sam Slate are jubilant at their prospects in the Rambler, a new mine, located only a few yards from the Court house, in this county. The rock is liberally streaked with gold, and several hundred dollars' worth of it has been extracted recently. There can be no doubt of the fact that the entire hill in the vicinity of the Rambler is one vast bed of mineral wealth, which will not be exhausted for generations to come.

## Montana.

AVALAANCHE GULCH.—Helena Independent, June 28: Twelve miles of this gulch are under patents. Hank Bros. have opened the gulch at points eight and nine miles from the mouth. At the upper point they have breasted out 200 feet 27 feet wide, which paid from \$10 to \$20 to the hand. Below them, Gregory, Hart & Co. have a drain down below Grant. John Gou, of Cave, is an equal owner in this body of ground. Shannon, Cox & Mayne, just below them, have a drain down to gravel. Wunderlin & Center have another drain down to pay, next below Hank's. Above, Dunsold & Baise have a drain on bedrock for 400 feet, but have not got across the succession of reefs. They are just getting into the bedrock. Hank & Co. also have a drain down 20 feet. The average depth of the ground is about 25 feet. Wesley Baise, D. A. Carlisle, Warren Tucker and Curt L. Harrington own ground here and there along the gulch, they having let some of the ground now being opened out and worked on shares for opening. On the upper bar, Blackwell, Baise, Carlisle and Harrington's hydraulics are running. This bar is two miles long and will last for 20 years, but the diggings pay uniformly well.

At Springtown, Marshall & Hornbuckle, Hertop, Wright & Co. and J. V. Stafford are running flumes on American hill. M. H. Marshall & Sutton are running a hydraulic at Jintown and employing a number of men. De Bourd & Co. are working in Price's gulch. Mahaney, Oxley, Quale, Holland & Terrell, Cotter, Bryson & Hightower and Williams are working in Oregon, New York and tributaries.

At Grennell's bar, on the Missouri, Einhorn & Davis, Kelley & Co. and E. J. Robinson are at work, the latter running a hydraulic and has not yet made a clean-up. Einhorn and Kelley have good diggings. Ingersoll, Handley, Mayo, Lawrenson and Conrad & Co. are running a drain in Cave, just above Springtown, and are 43 feet down. This gulch is now opened and prospected, but was filled by the flood last year. Olsen & Hausen are doing well in Upper Cave.

WHOP CR.—These mines are on a bar two miles above Toombs's ranch. Two hydraulics are running, one by Stagner, Rotwitt & Ferguson, the other by Warner & Co. These mines are easily worked, and, judging from the coal in sight, they must be good.

Ocean A. Robinson and D. F. Hedges have leased the Pittsburgh ditch, at French bar. They use some of the water, employing four men, let some on shares and sell about 100 inches. C. Drinkwater & Son are working ground on shares and doing well. Gray & Lightbody, Henderson & Co., Zuerger & Co. and Webber & Radford are at work. Mr. Pie, a very intelligent Chinaman, is running an extensive claim, and one other Chinese company are working. John Bird, of New York gulch, is on the bar.

## Oregon.

BURNT RIVER.—Cor. Bedrock Democrat, July 4: There is quite an excitement about placer mines about four miles east of A. J. Weatherly's ranch, near the summit of the mountain between Burnt and Snake rivers, on the Burnt river side of the mountain. Huffman and Nickem looked out this week \$50. The diggings are extensive. Antioch Frier and H. B. Frans have sunk a shaft on their quartz ledge 50 feet deep and started to run a level, and have struck a rich chimney in the Tilden mine, and are taking out large quantities of \$100 to the ton from a four-foot vein of free gold. The extensions on the same ledge are the Hendricks and Bulldozer. This ledge shows for 6,000 feet and is from four to six feet wide; it shows free gold, and prospecting is going on on Gold mountain. The Banche mine is showing a three-foot vein and that has since disintegrated on exposure to the action of the atmosphere and frost, so as to be readily worked. Another advantage gained by the opening of this race, is that the water used in Pomer and California gulches, that formerly escaped into Powder river, is now diverted into Blue canyon, where it is utilized in ground sluicing for the bedrock flume.

POKER FLAT.—Graham & Co. are opening some claims on this flat, about one mile from Auburn. We visited the scene of operations and found a race, one-half mile in length, 20 feet wide top, 8 feet on bottom and from 20 to 25 feet in depth, cut through the solid bedrock in the ridge which separates Blue canyon from Pomer flat. This race reaches the flat at a sufficient depth to thoroughly drain it. Prospecting was done here years ago, and gold found in paying quantities over quite an extensive area. These diggings have been enriched by the deposits of debris from Parker gulch, which being of a sticky nature, brought quantities of gold and amalgam with it, that has since disintegrated on exposure to the action of the atmosphere and frost, so as to be readily worked. Another advantage gained by the opening of this race, is that the water used in Pomer and California gulches, that formerly escaped into Powder river, is now diverted into Blue canyon, where it is utilized in ground sluicing for the bedrock flume.

FORT SUMMIT.—The present mining population consists of six white men and about 130 Chinese. The Chinese claims are situated principally on the bars and rims along Powder river for about three miles below town, while a few companies are working claims in the river above and on the east side of the south branch of Powder river. It is supposed that these claims are paying well, but as the owners give no definite information, no amounts can be given. The Downie Bros. claims are situated in the hill on the west side of this branch. They are now thoroughly prospected, and the most sanguine expectations of the owners fully realized. The banks are all gravel, from 20 to 30 feet in depth and prospected evenly and well throughout. The natural facilities for working, such as pressure, fall and dump, are all that could be desired, and the available amount of water cannot be worked out in 50 years. Messrs. Rimbo & Young have lately purchased the ditch and bar digging opposite town for the sum of \$300. They have found excellent prospects in what was heretofore considered the bedrock, but which proves to be slightly cemented gravel. They are preparing to commence operations on this ground. The mines of Fort Sumner are well supplied with water during the entire season. Mr. Rimbo owns nearly all the water rights on the main Powder river, and sells water for one cent an inch.

## Utah.

ALTA.—Cor. Salt Lake Tribune, July 6: I think the Flagstaff the best timbered mine in the camp. It is now shipping 1,200 sacks per day.

My next visit was to the Prince of Wales. Work on the lower levels of this mine has been discontinued. The ore supply in the upper levels is immense.

Work at the Reed and Benson is prosecuted with vigor. The tunnel is being pushed ahead night and day. It will tap the mine at a depth of 1,200 feet. They work a force of 30 men, and are shipping some very fine ore.

The Empire Tunnel company are building a boarding-house for their men. They intend to work a strong force. The boys at the Iris tunnel are hard at work, likewise at the Siskiyon.

I never give you the number of men employed on the Grizzly, but they seem to be pushing the work energetically.

The Hudson River tunnel is looking well, and its owners believe they are working their way into the best mine on the hill.

Work will soon commence on the Lumber Boy. A large body of first-class ore has been struck near the Flagstaff. I think that a thousand sacks of good ore on the dump; a very fair showing for the short time the boys have been at work.

## Transportation of Fruit.

A very important matter in connection with the fruit growing interests of this State, which, though already large, are daily increasing, is that of proper and perfect means of transportation for the products. The home market is comparatively limited, while that of the Eastern States offers excellent advantages, both in prices realized and almost unlimited demand. When Californians think of the great quantity of fruit which is here fed to the hogs, or left to rot for want of a market, even those not familiar with the business will recognize the necessity and advantage of appliances to carry the fruit, in a fresh condition, to distant markets.

A number of refrigerator cars have been invented for this special purpose, but the difficulty has been to keep the fruit dry enough in the presence of the ice to preserve it for any length of time. The absence of moisture is an essential feature, and has been found to be indispensable—a fact which has not received the attention it deserved. We mentioned in our last issue the case of the recent loss of a valuable car-load of fruit which was sent on from here and spoiled by the time it got to Chicago.

We saw this week at the Central Pacific railroad depot, a refrigerator car belonging to the Western Refrigerator Company, of San Francisco, which was designed to overcome the difficulties attending the shipment of fruit, and is now being loaded with fruit for New York. The car has made two trips from here with fruit and was found to be successful in preserving the fruit. The expense attendant on drawing these cars with the passenger trains is so great as to materially reduce the profits, and therefore this car is intended to be taken by the freight trains, although the trip consumes twice the time. This car is constructed with passenger trucks and Miller platform, and on top is fitted with doors to charge the proper receptacle with ice. The sides of the cars are provided with doors for the preserving chamber for packing and loading purposes. When building the car the inventor sets apart a six inch space surrounding the top, bottom and sides, as also the top and side doors, which he packs with a light and effective non-conductor (charcoal), impervious to the extreme heat of summer and the cold of winter, and the car is lined with No. 28 galvanized iron. Each of the top and side doors have triple closing edges like those of an iron safe, fitted with rubber weather strips, so that when the doors are closed and the patent screw cap on the outside is applied to the thread of the longitudinal latch-bar on the inside, it draws the door and the jam so closely and firmly together that no particle of air can enter the preserving chamber of the car, unless it is permitted to enter through the ventilator, which is only opened at the will of the consignee of a load of perishable matter and under his instructions or orders.

Inside of the car and attached to the top is properly secured an air-tight, V-shaped, galvanized iron receptacle or trough, which holds about one ton of ice. This receptacle, owing to its gutter form, prevents the water from the melting ice coming in contact with the sound ice, and as it melts, the water being facilitated by the gutter form of the lower part of the receptacle, passes out through an iron pipe extending through the bottom of the car, this cup being trapped at the lower end to prevent the admission of air.

The small gutter which runs below the V-shaped receptacle carries off the moisture which may be contained in the provision chamber and condenses on the surface of the ice box. Whatever hot air there may be has no chance to come in contact with the ice and melt it, so that economy in the use of ice is obtained. In other cars which we saw at the depot the ice was exposed to the contents of the cars in such a manner that it was liable to melt very rapidly and also added to the moisture in the car, instead of condensing it as in this case, which has been proved very injurious to fruit.

Last fall a car of this pattern was built at the Central Pacific works at Sacramento and left Sacramento for St. Louis on the 27th of October, loaded with California grapes, chiefly of the Muscat and Tokay varieties. The car also contained a few boxes of strawberries, pears and several boxes of tomatoes, celery and other vegetables for a test in this line. The St. Louis Republican of the 5th of December said: "On Oct. 27th this car, loaded with fine California grapes, etc., in boxes, left Sacramento by passenger train and arrived here a week later. Since that time it has been kept iced up and the preserving chamber opened daily for the removal of fruit for sale, and to-day the grapes are as sound as the day they were picked."

The company owning this car have established an office over the Grangers' Bank, No. 40 California street, and are now purchasing fruit for shipment to the East. It is their intention to continue this business and they now have seven cars employed. The success which has attended the experiment so far encourages them in the belief that they have solved the difficult question of fruit transportation for long distances, and the fact that they have embarked in the business themselves shows their faith in the results.

## Distinguished Botanists Coming.

EDITORS PRESS:—You kindly request botanical notes from me this season. Here is one. A letter just received from Dr. Gray, at Harvard University, Cambridge, Mass., announces: I have just read your articles in the Press, "Honorary Names in Science" and "Webber Lake." Many thanks. I can now tell you something that will please you. Dr. Hooker—now Sir Joseph Hooker, but none the better for that—is expected here about the 8th of July. We are going to Colorado and the Rocky Mountains together for a summer vacation, and may, late in August, get over to California. If so, we will come over from Truckee and see you and put up at the Webber hotel," etc. It may not be known to all your readers that Sir Joseph Hooker is the curator of the botanical gardens at Kew, Eng., the most extensive known; that he is the President of the Royal Society of England and the most renowned botanist in the world; also that Dr. Asa Gray is in charge of the botanical gardens at Cambridge, Mass., the most extensive in America, and that he is the most renowned botanist in the new world. These distinguished personages will perhaps be joined at St. Louis by Dr. Geo. Engelmann, the American authority on forest trees and several obscure genera; and at Davenport, Iowa, by the genial and sharp-eyed little Dr. C. C. Parry, the same who last season explored an Southern California and made a flying visit to Webber lake and the Sierra valley in the high Sierra.

J. G. LEMMON.

Sierraville, Cal., July 7th, 1877.

We are glad to hear that these lights of science are coming. We have no doubt that this coast will please them and that our people will give them a cordial welcome. Not only in the romantic recesses of the high Sierra will they find fraternal spirits. Our city men of science are preparing to welcome the visitors and to hear the sound of their voices before our Academy of Sciences. In addition to the tidings which Prof. Lemmon sends us of the prospective arrival, we have fuller details in the associated press telegrams of the present week. A dispatch from Washington, dated July 8th, says: Dr. J. D. Hooker, President of the Royal Society of London, director of the Kew botanical gardens, etc., and Lieut.-Gen. Strachey, of the Royal Bengal Engineers, and a member of the Council for India, have made arrangements through friends in Washington and elsewhere for a tour of scientific research this summer in Colorado, Utah and California, in company with Asa Gray, of Cambridge, the distinguished botanist, and Prof. Joseph Leidy, of Philadelphia, an eminent comparative anatomist, the result of which will be communicated in the form of reports to our Government. Dr. Hooker's position as President of the Royal Society has for a number of years made him the chief adviser of the crown in all scientific matters pertaining to the government, and on the Queen's last birthday he was knighted in consideration of his eminent scientific services. He is also corresponding member of the Institute of France. Gen. Strachey has been for many years a prominent member of the Royal Geographical Society, and is now President of the geographical section of the British Association for the Advancement of Science. He is author of several hooks of travel and has a world-wide reputation as a geographer. Mrs. Hooker and Mrs. Strachey will accompany their husbands. The former was the widow of Sir Wm. Jordan, an eminent naturalist, and Mrs. Strachey is the daughter of Sir J. R. Grant, formerly Governor of Bengal, and at a later period Governor of Jamaica. The party were to leave England about the 28th ult., with the expectation of proceeding directly to Boston. The results of this extended scientific tour, which has been thus arranged, will, it is believed, be of great interest and value, and these will be attained entirely at the private expense of the distinguished gentlemen who compose the expedition.

## Unemployed Miners.

The situation on the Comstock for laboring men is now, and has been, a very unpleasant one, to say the least. So many mines have closed down or reduced their working force that large numbers of miners are out of employment. The miners with families have a specially hard time of it, of course, and there is a great deal of distress among them. The different superintendents naturally do what they can in the way of giving these men employment, but there is not room for half of those desiring work. A laboring man addressed, through the *Enterprise*, an open letter to Col. J. G. Fair, and other superintendents, in which he says: "You know better than any one else the number of men who daily beg for work of you—men, too, who are as good workers as those you have in your mines. As you cannot employ all the men in the country at the same time without injury to your interests, and as you are not who does your work, provided it is properly done, then suppose there should be a draft, say once per month, of 80 or 100 men, and give their places to those who are actually in want of the necessities of life. This would give the needy a chance to help those depending on them, others to pay a few dues, and others still to leave the country. Those who are drafted are supposed to have money to leave the country, or live comfortably a few months. I don't think this is a selfish view of matters in Virginia. Should this be done in all the mines where new hands could do the work as well as old ones, which cannot be done in all places, the relief committee would soon find very little to do; women, then, would not beg for work for their husbands, to support their little ones. There is plenty of work in and around Virginia, if properly divided, to 'let live' every man,

woman and child in our midst, without beggary or want. I ask you candidly, could this not be done without prejudice or injury to your interest?"

In reply to this letter, Col. Fair told a Virginia *Chronicle* reporter that the ideas were not practicable for many obvious reasons. To turn off 80 or 100 old hands at once, every month, and replace them with an equal number of new men, would be injurious to any company's interests.

He said, however, that the object of relieving the needy can be accomplished better under the present system. In the first place, they favor married men as much as is possible and proper, and favor those whom they have reason to believe stand in greatest need. Col. Fair does not approve of the turn-about system proposed in the letter given above. He said: "I do not think that it would effect any improvement, and it might cause positive hardship in some cases. At present the best of feeling prevails among the miners. The young men have been acting in a very manly and generous way all through the dull spell. And they are doing so yet. Nearly every day some of the young fellows come forward and volunteer to quit work for a week, or two weeks, or a month, so as to give unemployed men a chance. This is done to a far greater extent than you can imagine. Now, a relief system of that kind promotes good feeling among the miners. The man who gives up his place of his own accord probably feels better about it than the man who takes his place; whereas, if the thing were compulsory, as that letter writer proposes, there would be bitter feelings on one side and no thanks on the other." Col. Fair said, furthermore, that the number of unemployed men was not by any means so great now as a few weeks ago, and he hoped to see everybody at work before long.

Comment on the voluntary relief system spoken of by Col. Fair is superfluous. When men are willing to sacrifice their own interests for those of others, in the cause of humanity, as is done in this case, they do the most honorable and praiseworthy act possible. Generosity of this kind seldom occurs except in isolated instances, and it is a compliment to the mining community higher than any other that could be paid them to have it said that they have acted in this generous manner. Miners are proverbially generous and manly, and we feel proud to represent the interests of a class with such noble characteristics.

## General News Items.

MEXICAN marauders have been chased over the Rio Grande by U. S. troops.

THE famine district in British India is daily doing better. Rain has fallen plentifully and sowing has begun. The position in Madras is still grave, and over 1,000,000 persons are fed by the relief works.

ADVICES from Peru state that in consequence of the attack by the British war vessels *Shah* and *Amethyst* on the Peruvian ram *Huascar*, the President has issued a proclamation, in which he declares that he will exact from Great Britain explanation and satisfaction, consequent on such wanton outrage on a friendly power.

THE Secretary of the Treasury gives notice that \$7,000,000 coupons of 5-20 bonds, under the Act of March 3d, 1865, and consols of 1865, will be paid at the United States Treasury on and after October 5th, when interest ceases; also \$3,000,000 registered bonds of the same issue.

THE silk manufacturers of Paterson are about to begin action against the strikers. They had written contracts, in which they bound themselves to finish all warps on which they had begun before engaging in the strike. When the recent strike occurred, a large number of strikers left work without finishing their warps.

THE President is so well satisfied that there is no further need for troops in the South, that he will shortly direct the issuing of orders to withdraw all troops from that section except such as may be necessary for garrison duty. The troops so withdrawn will either be transferred to service in the West or be sent to the Rio Grande. The order already issued transferring the Second Infantry from Atlanta to the Pacific coast is in pursuance of this determination.

THE sectional dry dock at the Navy Yard broke down last week while trying to take out the French man-of-war *Linnier*. The docks are old and have been out of repair for the past three or four years. There was no damage done to the ship. It will require many thousand dollars to repair the dock. The Department at Washington has been repeatedly asked for money to repair the sections, and such an accident as has happened has been predicted by the yard authorities.

THE *Sentinel* has telegrams from points in Minnesota, Iowa and Dakota, which report grasshoppers in large numbers flying with the wind. In Minnesota the hoppers are flying north, only a few lighting. At the points heard from in Minnesota, the hoppers are doing no damage. Farmers are encouraged by the crop prospect, in some places expecting average crops. A dispatch from Sauk Center, Minn., says that if no more boppers arrive they will harvest about half a crop. In Dakota, about 10% of the wheat crop is ruined. On the whole the report is favorable.

## Mining Suits.

A case was commenced in the Fifteenth District Court on the 3d inst., involving the distribution of a very important mining interest. The suit is brought by Early Hubbard against B. W. Regan, the Silver King mining company and James N. Barney.

According to the allegations set forth in the complaint, Hubbard and Regan, as partners in prospecting and speculation in Arizona, acquired possession of one-half of the Silver King claim and other valuable mining interests. The Silver King is believed to be one of the richest mining claims in the Territory, the up-set price of the half interest being fixed at half a million. This spring the two partners came to San Francisco for the purpose of negotiating a sale of the Silver King or organizing a company. The latter expedient was acted upon, and the company was incorporated with the following Trustees: J. M. Barney, B. W. Regan, G. L. Woods, B. J. Barney and W. H. Booth. The whole property was then deeded to the company, with certain stipulations regarding an equitable distribution and disposal of the stock. About the 1st of June Regan assumed to own one-half of the mine and ignored his partner as a mere employee and fixture. In pursuance of this policy he represented to Hubbard that the other stockholders in the mine were bankrupt and that there was danger of losing the whole interest, and Hubbard was persuaded to consent to a board of arbitration to settle the difference. The board selected, as intimates in the complaint, was in the interest of Regan specially. The arbitrators decided that Hubbard should relinquish his claim in the Silver King to Regan for the consideration of \$5,000. Hubbard, supposing the proceeding to be final and binding, yielded and accepted notes for the amount specified, payable in six months. Subsequently Hubbard became convinced that fraud had been practiced upon him.

Hubbard is represented in the complaint to be an illiterate person, without knowledge of law or commercial customs, and entirely pliable to those in whom he reposes confidence. The suit is for the dissolution of the partnership between Hubbard and Regan; an equal division of their mining interests; to vacate and set aside the arbitration and award mentioned; to annul the deeds which Hubbard was induced to sign misunderstandingly, as alleged; to enjoin Regan during the pendency of the action from disposing of or disturbing in any way the partnership property; to enjoin the Silver King mining company from issuing any stock to Regan, and to enjoin Barney from paying out any funds presumed to have been placed in his hands by Regan. Meantime a restraining order has been issued by the Court.

Judge Wheeler has issued an injunction, on complaint of P. J. Ryan, restraining the sale of stock of the Cornucopia G. & S. M. Co., delinquent for the second assessment. The dissatisfied stockholders aver that William M. Pierson, George R. Gibson, George H. Willard, M. J. McDonald and E. J. De Crano, on the 2d of May, usurped the office of Directors of the company affairs, and that on the 10th of May these pretended Directors levied an assessment of 5 cents per share on each and every share of the capital stock of the company; that of a previous assessment amounting to \$10,000, not more than \$2,000 has been expended, and therefore the second assessment is unnecessary. The complaint further alleges that \$3,000 of the first assessment has not been paid. The plaintiff prays that the books, papers and other effects of the company he delivered to the old Board of Directors.

## Meetings and Elections.

**GREAT EASTERN CON. QUARTZ M. Co.**—July 9: Trustees: H. H. Pearson, J. B. Low, J. A. Riley, F. A. Brin, J. H. Griffith. Officers—H. H. Pearson, President; J. C. Riley, Secretary.

**UTAH M. Co.**—July 10: Trustees: R. H. Follis, John Skae, George Wallace. Officers—R. H. Follis, President; John Skae, Vice President; Geo. C. Pratt, Secretary. James Fair, Superintendent. The deficiency is \$741.07.

**MONOC CO. M. Co.**—July 10: Trustees: Henry Williams, W. C. Parker, Robert Gardiner, Joseph Sharon. Officers—J. Sharon, President; E. F. Dickens, Secretary; W. E. Strouach, Superintendent.

**CHOLLAR POTOMI M. Co.**—July 10: Trustees: A. K. P. Hammon, J. D. Fry, C. L. Weller, J. H. Robinson, Joseph Sharon, Alpheus Bull, Wm. Morris. Officers—A. K. P. Hammon, President; J. D. Fry, Vice President; W. E. Dean, Secretary; J. L. Requa, Superintendent.

**MAT. CANAVAN** has resigned the position of Superintendent of the Dayton, and T. B. Perkins has been appointed in his place.

**BEST & BELCHER.**—July 9: Trustees: W. S. O'Brien, S. Heydenfeldt and George Wells. Officers—Robert Sherwood, President; George Condon, Vice President; F. F. Osbiston, Superintendent; William Willis, Secretary.

## New Incorporations.

The following companies have filed certificates of incorporation in the County Clerk's office at San Francisco:

**WILDMAN M. Co.**—July 7: Location, Amador Co. Capital stock, \$5,000.00. Directors—P. F. Cronise, John Truglio, J. T. Glover, C. A. Richmond and Alexander Forbes.

**GREEN MOUNTAIN M. Co.**—June 9: Location, Kern Co. Capital stock, \$25,000.00, in 50,000 shares. Directors—H. H. Lee, Geo. S. Fife, Wm. Spangle, C. B. Higgins and S. M. Holmes.

**DEBBEE BLUE GRAVEL M. Co.**—July 10: Location, Nevada Co. Capital stock, \$10,000.00. Directors—G. Dursol, E. Bostup, P. Metroy, L. Duterte and H. Barroilhet.

**CALIFORNIA PAPER CO.**—July 11: Object, to manufacture and sell paper: Capital stock, \$300,000. Directors—Egbert Judson, Albert Dibbee, Henry Pierce, Bartlett Dow, W. C. Talbot, R. B. Lane and B. J. Field.

**WOODWARD'S GARDENS** has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvement in the zoological department, besides the other features which have made it popular.

## Iron and Machine Works.

### PACIFIC ROLLING MILL COMPANY,

SAN FRANCISCO, CAL.

Established for the Manufacture of

RAILROAD AND OTHER IRON

—AND—

Every Variety of Shafting,

Embracing ALL SIZES of

Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames,

—ALSO—

Hammered Iron of Every Description and Size.

Orders addressed to PACIFIC ROLLING MILL COMPANY, P. O. Box 2032, San Francisco, Cal., will receive prompt attention. Office: 16 First Street.

The highest price paid for Scrap Iron.

### THE RISDON

Iron and Locomotive Works,

INCORPORATED.....APRIL 30, 1868  
CAPITAL.....\$1,000,000.

LOCATION OF WORKS:

Corner of Beale and Howard Streets,  
SAN FRANCISCO.

Manufacturers of Steam Engines, Quartz and Flour Mill Machinery, Steam Boilers (Marine, Locomotive and Stationary), Marine Engines (High and Low Pressure). All kinds of light and heavy Castings at lowest prices. Cams and Tappets, with chilled faces, guaranteed 40 per cent. more durable than ordinary iron.

Directors:

Joseph Moore, C. E. McLane,  
Wm. Norris, Wm. H. Taylor, J. B. Haggin,  
James D. Walker.

WM. H. TAYLOR.....President  
JOSEPH MOORE.....Vice-President and Superintendent  
LEWIS R. MEAD.....Secretary

THOS. PENDERGAST. HENRY S. SMITH

### ÆTNA IRON WORKS,

MANUFACTURERS OF

### IRON CASTINGS

and MACHINERY

OF ALL KINDS.

Fremont Street, Bet. Howard and Folsom

SAN FRANCISCO.

### FULTON

FOUNDRY AND IRON WORKS.

HINCKLEY & CO.,

Manufacturers of

STEAM ENGINES,

Quartz, Flour and Saw Mills,

Hayes' Improved Steam Pump, Brodie's Improved Crusher, Mining Pumps, Amalgamators, and all kinds of Machinery.

N. E. corner of Tehama and Fremont streets, above Howard, San Francisco.

### SHEET IRON PIPE.

Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle and box—introduced by this company, and guaranteed to outlast any other wheels made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

### SACRAMENTO BOILER WORKS,

37 Fremont St., cor. Mission, S. F.

HALL & KELSHAW,

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks, Hydraulic Pipe, Oil or Water Tanks, Ore and Water Buckets, Gasometers, Girders, Bridges and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK.

Repairing promptly attended to at the lowest possible terms.

## PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

RANKIN, BRAYTON & CO.,

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY, INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, Etc., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster Rock Drills and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

IMPROVED PORTABLE

Hoisting Engines,

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery.

## PHELPS MANUFACTURING COMPANY,

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle Work, Car Frames and Bolts, Machine Bolts, Set Screws and Tap Bolts, Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.

HOT AND COLD PRESSED HEXAGONAL AND SQUARE NUTS, WASHERS, BOLT ENDS, TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,

SAN FRANCISCO, CAL.

THOMPSON BROTHERS, EUREKA FOUNDRY, Light and Heavy Castings of Every Description Manufactured.

Sole Proprietors and Manufacturers of

Lynch's Ventilating and Illuminating Tile, The Only Illuminating Tile Manufactured for Lighting Cellars, Basements and Dark Rooms which provides proper ventilation for such places.

129 and 131 Beale Street, BET. MISSION & HOWARD, SAN FRANCISCO

## CALIFORNIA BRASS FOUNDRY,

No. 125 First Street, Opposite Minna,

SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE. J. H. WEED. V. KINGWELL.

## California Machine Works,

119 BEALE STREET, SAN FRANCISCO.

BIRCH, ARGALL & CO.,

Builders of QUARTZ, SAW AND FLOUR MILLS,

Keating's Sack Printing Presses,

THE ECONOMY HYDRAULIC HOIST FOR STORES,

And General Machinists.

## STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

## Miners' Foundry and Machine Works,

CO-OPERATIVE,

First Street, bet. Howard and Folsom, San Francisco

Machinery and Castings of all kinds.

## McAFEE, SPIERS & CO.,

BOILER MAKERS AND

GENERAL MACHINISTS,

Howard between Fremont and Beale Sts., San Francisco

## San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

SCREENS

Several first premiums received for Quartz Mill Screens, and Perforated Sheet Metals of every description. I would call special attention to my SLOTT CUT and SLOTT FENCED SCREENS, which are attracting much attention and giving universal satisfaction. This is the only establishment on the coast devoted exclusively to the manufacture of Screens. Mill owners using Battery Screens extensively can contract for large supplies at favorable rates. Orders solicited and promptly attended to.

32 Fremont Street, San Francisco.

## Machinery.

### The Ingersoll Rock Drill

Is Extensively Used in the East and

TAKES THE PLACE OF ALL OTHERS,

Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other Drill in the market. It has but few parts, is easily handled, being light, and has AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS, 320 Sansome Street (Room 10,)

## The Gardner Automatic Safety-Stop Governor.

MORE THAN TEN THOUSAND NOW IN USE. EVERY ONE WARRANTED.

SEND FOR DESCRIPTIVE CIRCULAR AND PRICE LIST.

When all others fail, stay a "Gardner." We have all sizes of these celebrated Steam Governors on hand at all times.

BERRY & PLACE,

Selling Agents for the Pacific States, Cor. Market & Fremont Sts., S. F.

## THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:

One man.....	\$ 4 00
One team.....	3 00
Wood—23 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 24 cents.....	40 00
Cost of 20 tons.....	\$52 25
Cost of one ton.....	2 61 1/2

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in Peavine District, Nev., and at the Exchequer mill, Alpine Co., Cal. For further information, apply to

D. J. O'HARRA, Reno, Nevada.

THE

## LANE & BODLEY COMPANY,

John and Water Sts., Cincinnati, O.,

Sole Manufacturers of

BRUCKNER'S PATENT REVOLVING FURNACE, For Chloridizing, Desulphurizing and Roasting Ores.

—ALSO—

STEAM ENGINES, SAWMILLS, SHAFTING, GEARING AND MINING MACHINERY.

Send for our Illustrated catalogue.

## Metallurgy and Ores.

JOHN TAYLOR & CO.,

Importers of and Dealers in

ASSAYERS' MATERIALS, CHEMICAL APPARATUS AND CHEMICALS, DRUGGISTS' GLASSWARE AND SUNDRIES, Etc.

512 & 518 Washington St., San Francisco.

We would call the special attention of Assayers, Chemists, Mining Companies, Milling Companies, Prospectors, etc., to our stock of Clay Crucibles, Muffles, Dry Cups, etc., manufactured by the Patent Plumbago Crucible Co., of London, England, for which we have been made Sole Agents for the Pacific Coast. Circulars with prices will be sent upon application.

Also, to our large and well adapted stock of

Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application.

JOHN TAYLOR & CO.

## THOS. PRICE'S

Assay Office and Chemical Laboratory,

524 Sacramento St., S. F.

Deposits of bullion received, melted into bars, and returned made in from 24 to 48 hours.

Bullion can be forwarded to this Office from any part of the interior by Express, and returns made in the same manner.

Careful Analysis made of Ores, Metals, Soils, Waters, Industrial Products, Etc. Mines examined and reported upon. Consultations on Chemical and Metallurgical questions.

## Nevada Metallurgical Works,

21 First Street, 3 doors from Market, S. F

Ores worked by any process.

Ores sampled.

ASSAYING in all its branches.

Analysis of Ores, Minerals, Waters, etc.

WORKING TESTS MADE.

Plans furnished for the most suitable process for working Ores.

Special attention paid to Examinations of Mines; plans and reports furnished.

E. HUHN,

C. A. LUCKHARDT, Mining Engineers and Metallurgists

## LEOPOLD KUH,

(Formerly of the U. S. Branch Mint, S. F.)

Assayer and Metallurgical Chemist,

No. 611 COMMERCIAL STREET,

(Between Montgomery and Kearny,)

SAN FRANCISCO, CAL.

## INSTRUCTIONS IN ASSAYING,

Chemical Analysis, Determination of Minerals, and use of the Blow-pipe.

HENRY G. HANKS

Will receive a few pupils at his new laboratory, No. 617

Montgomery Street, up-stairs. TERMS MODERATE.

HAMILTON, OHIO.

# AVERILL MIXED PAINT,

Was awarded the Highest

## MEDAL AND DIPLOMA

AT THE CENTENNIAL EXHIBITION FOR A READY MIXED PAINT

THIS CELEBRATED PAINT IS MANUFACTURED BY THE

## CALIFORNIA PAINT COMPANY.

THIS PAINT IS MIXED READY FOR USE.

THE PUREST WHITE, AND OF ANY DESIRED SHADE OR COLOR.

It will not peel, crack, nor chalk off, and will last twice as long as the best white lead, prepared in the ordinary way. Is cheaper, handsomer, more durable and elastic than the best of any other paint.

Extract From the REPORT OF THE CENTENNIAL COMMISSIONERS.

"This Paint is quite different from paints in general use. \* \* \* Work which has been done with it, some of it exposed for years to the moist atmosphere of the sea-shore, establishes its great durability. \* \* \* It is mixed ready for use, easily applied, of great beauty, and economical."

Extract From the REPORT OF THE FRENCH (CENTENNIAL) COMMISSION.

"It possesses merits unattainable by the old method of combining paint. \* \* \* It can be applied with great facility and perfect regularity; dries with a rich, glossy surface, and will not chalk or crack off. \* \* \* It never separates, is always ready for use, and will not spoil when exposed to the air. \* \* \* It can be applied by any one whether a practical painter or not."

For Sample Cards and Circulars, Address CALIFORNIA PAINT COMPANY, 27 Stevenson Street, S. F.

H. W. JOHNS' PATENT

ASBESTOS ROOFING AND ASBESTOS PAINTS,  
ASBESTOS CEMENT FOR LEAKY ROOFS  
Asbestos Roof Paints for Leaky Roofs,  
ASBESTOS BOILER AND PIPE COVERINGS

FOR SALE BY ALL COUNTRY MERCHANTS.

Thompson & Upson, 5 First Street, near Market, S. F.,

EXCLUSIVE IMPORTERS FOR THE PACIFIC COAST.

## ASBESTOS COATING

For Steam Boilers, Pipes, etc. Best non-conductor of heat in use. It effects a LARGE SAVING OF FUEL, LASTS AS LONG AS THE IRON to which it is applied, and is reasonable in cost.

## PATENTED CAST STEEL SHOES AND DIES.

Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents  
to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of Iron from which our Steel is manufactured, and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at twelve cents per pound, delivered at San Francisco or Sacramento, instead of sixteen cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc., etc.

Address all orders, with dimensions or drawings, to

CAST STEEL SHOE & DIE CO.,

## Mining and Scientific Press Patent Agency.

THE MINING AND SCIENTIFIC PRESS PATENT AGENCY was established in 1860—the first west of the Rocky Mountains. It has kept step with the rapid march of mechanical improvements. The records in its archives, its constantly increasing library, the accumulation of information of special importance to our home inventors, and the experience of its proprietors in an extensive and long continued personal practice in patent business, affords them combined advantages greater than any other agents can possibly offer to Pacific Coast inventors. Circulars of advice, free.

Address,  
**DEWEY & CO.,**  
No. 224 Sansome St., S. F.

### OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.  
B. W. CROWELL—Amador, Placer, Calaveras and Tuolumne counties.  
G. W. McGREW—United States.  
A. C. KNOX—Plumas, Sierra, Lassen, Placer and Nevada counties.  
C. N. WEST—Santa Cruz, Monterey and San Benito counties.  
A. C. CHAMPION—Sonoma, Marin and Mendocino counties.  
A. U. STRONG—Lake, Napa and Solano counties.  
Ed. T. PLANK—Dakota Territory (Black Hills).  
JOSEPH DIMMICK—Mendocino, Humboldt and Del Norte counties.  
W. D. WHITE—San Bernardino and Los Angeles counties.

Engraving done at this office.

## UNITED STATES Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with Instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

## A Hydraulic Gravel Elevator.

### An Important Appliance for Hydraulic Miners.

In almost every gravel mining country there are extensive beds of auriferous earth, sand, and gravel, which have not heretofore been made available, simply because no efficient system and apparatus have been devised for working them economically. In many instances the upper stratum of earth has been worked off at a fair profit, by existing methods and devices; but the expense of handling, removing and washing the material at a greater depth became so expensive, that the mines were abandoned, in the face of the well-known fact that the richest deposits of gold lie in the strata nearest the bedrock.

Many rich and extensive paying deposits lie in creeks, basins and flats too low to be worked by bedrock tunnels, cuts or drains, at any cost, and the only method by which they have been heretofore worked has been by the shovel, wheelbarrow, whim or derrick. This process being very slow and expensive, requiring in many instances pumps, engines and other machinery, to free the mines from water while being worked; rivers have been wing-dammed, turned and flumed and the remaining seepage water pumped out while the gravel has been removed by the old methods of the wheelbarrow and shovel.

Mr. Geo. W. Cranston has invented and patented through the MINING AND SCIENTIFIC PRESS Patent Agency, a device for overcoming some of these difficulties, which is illustrated on this page. It is not by any means an experimental appliance, but is at practical work in several places. It is not proposed with it to pump up rivers, yet after the surface water has been turned around, the machine is proposed to dispense with shovels, wheelbarrows and pumps, and work such mines as easy as those which have outlets for sluicing through.

It is a well-known fact to every hydraulic miner that water and gravel can be driven up hill by hydraulic force, and that it is only necessary to give water a greater velocity in a flume to make it carry more gravel. Miners, to accomplish this, give their flumes more grade.

Now, the inventor has discovered that it is only necessary to give water a little more velocity than it travels in an ordinary flume in order to make it carry gravel up hill. To accomplish this, and impart the required velocity to the water and gravel, a closed flume is constructed on an inclination upward, with a horizontal ground section made of cast iron, and a hydraulic nozzle introduced into a chamber in the ground section of the machine, and the nozzle pointed in the direction it is desired to make the water go. (See Fig. 2.) This ground section has an open end, back or behind the nozzle. There the water and gravel enters the machine.

The open end is connected with the flume, placed in the bottom of the mine, and the gravel is washed or driven into this flume in the ordinary way of mining. Between this flume and the open end, or throat, of the machine, is placed a grizzly or grating, that turns off to one side any large boulders, too large to pass through the throat of the machine. At the opposite

end of this ground section they connect the upward inclined closed flume, and also connect it at its upward end with the flume at the top of the mine, so as to discharge the material and water elevated into this flume placed on top. (Fig. 1.)

In order to operate this machine, the water is turned on under pressure, into the hydraulic pipe, connected with the nozzle, which discharges inside the chamber of the ground section of the machine. They then turn the water on the two monitors that drives the gravel into the flume in the bottom of the mine.

It will be evident, from the above description, that if there is sufficient force exerted by the water discharged from the hydraulic nozzle of the machine to drive and lift the material

The water discharged by the hydraulic nozzle elevator operates both to thin the material and water when it enters, and to drive it at the same time up through the elevator spout. This disintegration and washing process above alluded to, produced by the hydraulic force of the nozzle of the machine, so thoroughly washes and dissolves the gravel, in its upward passage through the elevator spout, that the inventors claim that expensive long flumes for washing are not necessary, the gravel being washed better in a single passage through this machine than in traveling one-half mile through an ordinary flume.

The process of employing under-currents is new and possesses several advantages. They are placed a short distance down the flume from

where the spout discharges to allow the surface water to become settled a little. They cut away the side of the flume next to the settling tank and place bars lengthwise, at short intervals apart, across the opening made in the flume. The surface water of the flume, containing but little gravel, flows over into the settling tank. The bars prevent the gravel and boulders from flowing over with the water and keep them in the main flume. (See O, Fig. 1.)

This settling tank has two compartments. The surface water from the compartment next to the flume, after it has settled, flows over into an outer compartment, where it is led back by pipes or otherwise into the mine to wash the gravel into the machine. (See AAA, Fig. 1.)

This tank is provided also with sliding gates next to the flume, to regulate the amount of water drawn from the main flume, so that no more water is allowed to run in the flume than is necessary to carry the gravel through to the dump.

The compartment of the tank, next to the flume, where the gravel settles, has a gate at the bottom to draw off the gravel collected in the tank, and has a small spout or flume to convey it off down, where it can be discharged into the main flume again. This gate can be closed and the gravel drawn off when the box gets full, or can be left partially open, so that the gravel is drawn off as fast as collected.

It will be evident that the greatest amount of wear will be on the ground section and curves, so these parts are made in sections so as to be easily repaired. The machine is made so as to be worked with an irregular head of water.

The machine is simple of construction, having neither belts, wheels, pulleys, valves

nor hockets—nothing to get out of repair, and nothing complicated. It can be run by any one, and is really a great improvement. It sluices water and gravel uphill, works mines that have no dump, saves bedrock tunnels, open cuts and drains; works as good as a flume of 10 or 12-inch grade, and will handle as much gravel in proportion to the water used. It can be made of any capacity. Wherever hydraulic pressure can be had, say 100, 200 or 300 feet, a mine can be worked to as good advantage 20 to 50 feet deep as through an open cut or tunnel.

This machine is successfully working at the American Flat claim at Fiddletown, Amador Co., at Canyon Creek, Oregon and at several other places.

Five sizes of this elevator are made. A 12-inch machine, the smallest, carries 300 inches of water and gravel in the sluice head; the largest, a 28-inch machine, carries 1,500 inches of water and gravel in the sluice head. The driving water is always returned to the mine and used for washing the gravel into the machine. A model machine can be seen at work any time in the city, at the office of the agent, J. Hendy, corner of Fremont and Mission streets.

THE Bonanza mines produced in June \$2,962,069, of which 47.77 per cent. is gold. California produced \$1,567,931, of which \$773,972 was gold and \$793,959 silver. Consolidated Virginia produced \$1,394,678, of which \$641,278 was gold and \$754,500 was silver. The Consolidated Virginia amount is \$153,000 in excess of that of the month of May.

CRANSTON'S HYDRAULIC ELEVATOR FOR GRAVEL MINING.

coming through the flume and into the throat of the machine and carry it through the upward inclined spout, and discharge it into the flume on top, that earth, sand, gravel and rocks entering the machine must necessarily be carried along and discharged with the water into the flume on top. The water, gravel and material is thus made to travel through the machine at high speed by the direct action of the hydraulic force, exerted by the nozzle of the machine. All of the gravel and material comes in direct con-

tact with the stream of water discharged from this nozzle, consequently it serves greatly to dissolve and pulverize all gravel that is hard and difficult to wash.

The gravel must pass through the machine at a high rate of speed, which is absolutely necessary to make it work. The gravel never chokes or lodges when the machine is working under pressure. Gravel and water have been run through this machine, by actual test, as thick as the water will carry the gravel through a flume on twenty-four inches grade, and it was impossible to choke the machine by any head of water it was calculated to carry.

machine, thus mixing, agitating and intermingling with the gold and other materials, as it is passing through the machine in an endless returning current. This under-current is placed so near the head of the flume that it saves most of the gold, and can be cleaned up every day, if desired, without stopping the machine or waiting for a long run before cleaning up.

In order to recover the elevating or driving water, which is discharged by the nozzle of the machine, and utilize it for washing the gravel in the mine into the machine, they construct a settling tank on the side of the flume on top of the mine, just far enough down the flume from

SECTIONAL VIEW OF HYDRAULIC GRAVEL ELEVATOR.

## CORRESPONDENCE.

### El Dorado Mines.

[From Our Regular Correspondent.]

El Dorado is yet a gold-producing county, although the high reputation it has attained for fruit has led many to suppose the mines were entirely neglected. Even this year, with the great lack of water and general depression, the mining does not fail to add something to the world's life arteries.

Good pay is being taken out right in the heart of the city of Placerville, and the probability is that the main street will yet be worked over and the gold secured, and at the same time a good sewerage drain can be laid down.

The sound of the hydraulic mining can be heard for miles away, so great is the force and concussion of the water as it bores into the gravelly banks. Placerville being the county seat and beautifully located amid these hills that are mostly occupied with neat residences, holds on to its vigor well and is yet a very stirring little city, making a mercantile, mechanical, social, religious and educational center of value to all the surrounding country. Its neighbor,

### Diamond Springs,

As a place of business or town, is dead and buried, and only the stately walls, with the strong iron doors of the many deserted buildings, attests its former greatness. It now contains two hotels, two stores, saloon, and some good residences.

There is yet some mining going on.

### The Church-Union M. Co.,

Three miles south, has been operating about one year. Have a ledge developed for about 300 feet, with average of three feet thickness. Last clean-up went \$45 per ton. Work eight or ten men (all white men). The whole outlook at present favorable. They use a hurdy wheel, water from Park canal and water company, under a pressure of 300 feet. New York capital interested.

### The Griffith Con. M. & M. Co.,

Located one mile south of Dead springs, has a shaft 140 feet in depth; east vein of ledge at the 80-foot level is eight feet thick, of finely laminated rock, showing rich in free gold. My next view of the ledge at 120-foot level, 12 feet in thickness, showing finely in free gold and sulphurets. A new prospect mill to run by water from the Park ditch is about ready to start up, or was to start a few days since. The mill is being built by contract by a very successful machinist, D. E. Wickham, of Placerville. The whole management of the property is with M. G. Griffith, at Diamond Springs. The specimens of sulphurets, as also those rich in free gold taken from the mine, speak very encouragingly for a real success—obtained not by accident, but by going carefully to work where Mr. Probabilities pointed, and there achieving success as reward for continued effort.

The time may be near at hand when hundreds of these enterprises will be started by men of small capital and prove that instead of the gold being exhausted, that the real deposit had not yet been reached by early miners. About three miles out of Diamond Springs an Oakland company have purchased some mining and farming lands, to carry on farming and mining. Messrs. Fredrick, Olmstead and Watt are the associated parties. They have 80 acres as mining land and 160 as farming, but expect some of the farming land will pay for mining. It will furnish them a healthy summer resort and good investment aside from the mines. There are many opportunities to buy valuable properties very cheaply through all this region. Why? does a voice ask? My hotel man has answered it in this way: "Many of these people have been here too long; they got here early, made money easy, and now will not reconcile to the changed condition, and dream yet that some windfall will make them rich without an effort."

### Mining in Amador Co.

[From Our Regular Correspondent.]

EDITORS PRESS:—Sutter Creek is a large and thriving town of perhaps near 1,500 inhabitants, four miles from Jackson, the county seat. In addition to all the ordinary trades, professions, and merchandising, there are two iron foundries and machine shops, with their lathes and planing machines, so that very large and complicated machinery is made and repaired here as well as in San Francisco. At Knight's foundry and machine shop I saw various sizes of his celebrated solid water wheel being fitted up. It is being used very extensively and does its own advertising for efficiency, durability and cheapness. The demand for it is increasing and extending.

Knight's foundry is turning out some very heavy quartz mill mortars (with Knight's improved false backs) all ready for shipment.

They also cast the heavy lead gas generators

for sulphurets works, a job requiring much skill, and only a few can succeed in casting them.

The sulphurets works of Sutter are under the management of Mr. C. J. Garland, and are running right along, not as an experiment, but as an acknowledged success, and now a necessity in every milling community, to force the sulphurets to give up their gold. The mines in and about Sutter Creek that are running are not running with full force of men.

### The Oneida Co.,

Under the management of Robert Robinson, a thorough and experienced mill and mine operator, is employing not more than half complement of men, and not using all their stamps. The Oneida has extensive improvements in hoisting and milling facilities; located very pleasantly, and well adapted to work with strictest economy.

The high reputation of its Superintendent for efficiency, strictest economy, and success, while superintending in Nevada is a good assurance that he will soon have the lively music of the eighty stamps. Would like to give some figures of present doings, but they are not at hand.

The Eureka mill, now the Amador Consolidated, is running 40 stamps, is said to be doing well. Mahoney mine is running a small force. The Lincoln is also running.

### The Amador Canal and Mining Co.,

Very extensively engaged in water, mines, milling and lumber, are starting to build a mill for lumber sawing, and manufacturing doors, etc., on the hill between Sutter Creek and Jackson and propose to send the lumber along the divide 12 miles down to Lone by a V flume.

They will float their bolts and short logs down the canal to the mill. They are furnishing water power for ten or twelve mills, and always utilizing the water again and again. It is astonishing to see the change that a little stream of water will produce on hill and valley. It seems to create almost from nothing, everything beautiful and useful and populate the waste places. The thin bed-rock soil is improved by the sediment of fine sand and loam deposited by the turbid water, and made productive.

The Phenix Gold and Silver Mining Co. At Plymouth, owned principally by Hayward in charge of Mr. Green, and Mr. Jones, foreman, is at present running an 80-stamp mill and 125 men. The mill uses water power, while the mine uses steam for hoisting.

Timbers are brought 25 miles by canal, four men bringing 100 logs through daily. The 20-inch water-wheel uses 600 inches under 65 feet fall. The mine is worked to depth of 1,000 feet. Bullion yield averaging very well. The saving of concentrated sulphurets about 2½ tons per day, which pays about \$125 per ton above cost of working. The sulphurets are worked to 85 per cent. of assay value. Charge \$25 per ton for desulphurizing.

### Tybo District

A correspondent of the Belmont Courier, writing from Tybo, says:

The Tybo mining property, well known and highly spoken of, is undoubtedly one of the most productive in this section of the great east. Three years ago it possessed neither name nor reputation to give it prominence in the mining circles of the coast. It was undertaken as a venture, but as a venture it has proved a magnificent success. Writing of its purchase to the San Francisco MINING AND SCIENTIFIC PRESS in March, 1874, I predicted this success, and now after three years of active development I find that my predictions have been more than borne out by the brilliant results that have been obtained. I quote: "The spunkiness of San Francisco capitalists, when viewed in connection with this property, is certainly singularly strange, to say the least. To have allowed it to remain there (I wrote from Eureka), lying idle during the past three or four years, without making hardly an effort to acquire it, does not speak very well for either their sagacity or enterprise." A few of those mining men, who at the period referred to contemplated its purchase, have since then regretted the procrastinating influences which were mainly instrumental in preventing it from coming under their control. Bill Lett, George Hearst and the irreproachable Gashewit, with all their wide-awake properties, allowed it to slip out of their hands. So much the better for the interest of Tybo that it did, for it is doubtful whether the property would, under the management of these old and experienced manipulators, have been either as highly developed or as profitably worked as it has been under the direction of its present owners. The series of mines (five in number), which

### Comprise the Property,

Are located on a true fissure, whose strike is south of east and north of west, with the angle of dip to the northeast. The Two G mine, whose name has made the property famous, is the best explored of the group; though the Hunkidori is now being very vigorously prospected, and with excellent results. The work is done by contract under the immediate direction of C. S. Hammer, the contractor. An incline shaft of some 250 or 300 feet has been sunk along the dip of the lode, and drifting in opposite directions along its trend, is disclosing a well-formed vein and good prospects. The Two G mine and its extension on the southeast, on the upper slopes of Precipio mountain, lately purchased of Messrs. Garrett & Jagslin, are now in a very prosperous condition, and every foot of virgin ground that is being opened

brings to light large masses of high grade ore. The lode, too, continues to maintain its reputation for both the strength and regularity of its formation. The perfection of its walls—limestone on the baring and porphyry on the foot—and for the general uniformity which from the first has distinguished its dip to the northeast. The main hoisting shaft has now reached a depth of between 300 and 400 feet, but the depth from the lowermost workings to the apex of the lode must approximate 700 feet. There is considerable water encountered in the shaft, but not enough to test the capacity of the new steam pump, which keeps it under effectual subjection. Everything in and around the mine and works moves with the regularity of clock work. There are from 90 to 100 tons of ore daily extracted and

### Hauled to the Furnaces

For reduction. These cupolas are under the immediate control of Mr. David Stringer, formerly of the Richmond Consolidated at Eureka, who, as a thoroughly practical and experienced smelter, assayer, bullion refiner and metallurgist, has few equals in this State. The Eureka ores carry an ample supply of fluxing matter, hence the readiness with which they are smelted. This, however, is or has not been the case with the Tybo ores, which, until lately, were singularly destitute of the ferruginous gangue so essential for fluxing purposes. This paucity of iron and other aids to smelting, has heretofore necessitated the use of a considerable quantity of lime, which, of course, materially reduced not only the reduction capacity of the furnaces, but the profits of the company, in consequence of the increased cost of working the ores. Happily for the interests of the owners this state of thing no longer exists, for the ores are now better leached than formerly, and the lode is likewise producing more iron than it did at any former period in its history. The

### Reduction Capacity

of the furnaces approximates on an average 92 to 95 tons each 24 hours, and their daily bullion output, which, of course, fluctuates here as everywhere, may be placed at from 9 to 11 tons for the same period. The latter was the result obtained from the 24-hour's run ending at 7 A. M. on the 2d instant. This is a good showing, and it speaks well for both the mine and the skill of the smelter. This bullion exhibits an average assay value of \$450 per ton; this would give \$4,950 as the result of the 24 hours' run, which I incidentally give for the purpose of illustrating the increasing value of the property as well as the success that invariably attends skillful management. Ever since David Stringer assumed control of the reduction department, the quantity of lime flux used has been daily decreased, thereby adding to the reducing power of the furnaces, and the monthly returns have also steadily increased, and but for the unavoidable stoppage of one furnace for six days last month's bullion yield would be found far in advance of all preceding ones. But notwithstanding the loss entailed by these six days, the June yield exhibits an aggregate of \$99,413.39 which I account a very handsome showing for about 21 day's run of one furnace and 29 day's run of the other. These works have produced 317 shipments of 10 tons to the shipment since active smelting operations were inaugurated less than three years ago. Taking the present value of bullion as a basis for calculation, and much of it has exceeded this rate, we find that those 3,170 tons have produced a total of \$1,426,500, or at the rate of \$600,000 or \$700,000 per annum, for smelting operations have not been carried on for much above two years and four or five months, and there was but one furnace used for the major portion of this time. The foregoing data will furnish the reader food for reflection, and by showing him how profitable a business is mining they will also give him a much better idea of the value of the Tybo property than he could receive from any other source. Were it located on the Comstock the price of its shares would be found away up among the fancy figures of the leading mines of that celebrated lode.

### Studying Mining.

The entire third class in the Department of Engineering and Mining of the Columbia College School of Mines, numbering about 30 students, left this city early yesterday morning by the Central railroad of New Jersey, for Drifton, Pa., for the purpose of obtaining some practical experience in the coal mines of that region. The entire party is under the charge of Professors Trowbridge and Monroe, and the intention is to have the young men go through all the regular duties of miners for some four hours each day. The objective point is in Luzerne county, on the edge of the great mining district of Pennsylvania, and it is possible that before their return the young gentlemen will also be inducted into the mysteries of extracting iron ore.

The students started out with the expectation of staying about a month in the coal region. They intend to work as ordinary miners while there, but not quite the full number of hours, as none of the professors having them in charge believe they would be able to endure the fatigue for more than half the regular time of ordinary miners. They intend, however, that the expedition shall be no mere holiday excursion, but that a valuable stock of knowledge shall be laid in by each student. Temporary quarters for the party will be provided by Mr. Eckley Cox, of this city, owner of one of the mines in the neighborhood, but all the necessary topographi-

cal and other instruments required for a scientific investigation have been taken by the party. Surveys of the district will be made, as also experiments at electrical blasting, under Prof. Monroe's direction.

When the students reach the mines, they will be told off in small parties and given in charge of a certain number of old miners, who are expected to give such information as they have at their command, and keep a general supervision over the young men under ground. They are expected to furnish a definite amount of coal per day, to be examined and "graded" like that of an ordinary miner, and paid for in the same way. In fact, the object in view by everybody is to give the students a little taste of what they have to expect if they want to earn their living in that way, or to let them know what those who do earn it so have to go through, in the hope that the experience will prove of benefit to them if they become superintendents or such like.

It has been the practice for a long time in Germany, where mining and engineering are more scientifically taught than here, to get up parties like this during each vacation, but the plan has never been tried here before. If this expedition should prove successful, as all hope it may, it will in all probability be the pioneer of a long line like it, not only from Columbia, but from the other colleges.—*New York World.*

### Silver King Products.

This mine has been shipping 30 tons per month of selected ore with great regularity for about a year. Nothing is shipped that goes less than \$1,000 per ton, and ores below that value are being stored away on the dumps. Actual receipts from sales of ores in San Francisco have averaged \$1,400 per ton, a few selected lots going as high as \$15,000 to \$20,000 per ton. The last lot of 10 tons sold for 82% of assay value. There is now en route one selected lot of over 1,000 pounds of a black malleable chloride ore from this mine, which is expected to sell at the rate of \$8 per pound; also 12 tons of ordinary \$1,400 ore. An incline has been sunk on the ledge, following the foot-wall for about 250 feet, and is in ore all the way down. The last reported assay from the bottom of this incline was \$825. Since the mine passed into the hands of Barney and Reagan, no stopping has been done, but ores taken from the openings, and below their standard shipping assay of \$1,000 per ton, have accumulated on the dumps to such an extent as to render it necessary to make more room by some disposition of them. As an experiment, a five-stamp mill, with power for more stamps, has been put up, and will be started up on Monday, the 25th. The whole dumps will be run through the mill, pulverized and then passed on to a Frue concentrator. The concentrations will then be sacked and shipped for sale in San Francisco. Experience has shown that the richer ores from this mine sell to smelting works in California for a higher figure than could be realized by milling them on the spot. The want of base metal for fluxes and scarcity of charcoal material in the immediate vicinity, make smelting works near the mine out of the question for the present. The last of the concentrating machinery is due on the ground to-day, and as all is in readiness for it, will be at work by the time the mill has pulp enough made to start. The supply on the dumps of ore assaying from \$300 to \$1,000 is very large. The lowest estimate of its net value for concentration is placed at \$500,000. Even if the contractors do more than is claimed for them, the tailings will be pretty fair milling ore. Last fall the Copeland brothers bought one of the smaller Silver King dumps for \$20,000 in cash. They spent nearly \$20,000 more in hauling it six miles down to water at Picket Post and concentrating it in rockers, jigs, sluice boxes and gold pans. The ore was not pulverized, but the larger pieces were simply broken and sorted by hand. The richer pieces and concentrations were shipped to San Francisco and sold. From less than 300 tons on the dump, they realized over \$100,000.—*Arizona Citizen.*

PETROLEUM DISCOVERIES.—It appears from the recent important discoveries of new oil-producing regions, that the supply in Pennsylvania is far from being exhausted. This new development is the most important that has taken place in years, and has already caused a considerable decline in prices. A Pittsburgh paper says: The most prominent features in the business interest of Pittsburgh this week are the remarkable development of new wells and the downward plunge of prices consequent thereon. The strikes at Bullion run have been of wonderful richness, and recall the strikes at Pithole in past years, when thousand barrel gushers were the ordinary prizes in this lottery of enterprise. A rough calculation shows that the strikes at Bullion run constitute an increase of production equal to 25% or 30% of the average of last month. In that view of the case it is not remarkable that the prices should give way from \$2.25, the quotation at the opening of the month, to \$2 at the first of the week, and then take a sudden plunge to \$1.50. It is not alone the increase of production thus developed, but the large addition of possible producing territory which sends prices down and makes it possible that prices this summer will seek the level they reached in 1873. As some of the banks have loaned quite freely on certificates as collateral at \$1.50, they will be obliged to call for more margins, which is likely to further assist the demoralization.

## MECHANICAL PROGRESS.

### Our Mechanical Triumphs.

The rapid advance which American mechanics and manufactures are making is the theme of frequent comment by the English press. The *Colliery Guardian*, after naming at least a score of instances in which America is trenching upon markets which have heretofore gained supplies from English sources, remarks as follows: These are a few illustrations of the increasing American competition with which our mechanical industry has to deal upon the great markets of the world. The Americans are not satisfied with having driven our iron and machinery out of their markets by means of a prohibitory tariff, but they are also endeavoring to reduce the demand for our steam engines, our locomotives, and our general machinery in the leading markets of the world. This was to be anticipated as an inevitable result of the great progress which American metallurgy and American coal-mining have made during the last seven years. Iron and steel of American manufacture have now become so cheap and are produced upon so large a scale that they must be worked up somehow; and if the articles into which they are converted cannot find a sale upon American markets, they must be disposed of upon the general markets of the world. This is the conclusion at which Jonathan has arrived, and it is only a natural consequence of the recent course taken by the industrial history of the United States. The circumstances to which we have been adverting appear to us to demand the gravest attention on the part of both the capitalists and the workmen of the Old World. We have always fancied that Belgian competition was a bugbear rather than otherwise. It is true that iron has been produced at marvelously cheap rates upon the Belgian markets, and that some of it has found its way into this country, and has displaced a corresponding amount of English iron. But the competition of Belgian mechanical and metallurgical industry with our own differs from the competition of American mechanical and metallurgical industry in this important particular—it is comparatively limited in extent, and consequently it does not do us the mischief which some writers have supposed. The case seems wholly different with the American competition with which we are now threatened. The productive powers of the Americans, to whatever branch of human effort they may devote themselves, appear to be only limited by the demand which may spring up for their products. Their supplies of ironstone are practically boundless; their supplies of coal are practically boundless; their supplies of labor are practically boundless. They greatly excel the Belgians in the extent and importance of the mercantile marine, by means of which they are enabled to scatter their manufactures all over the world. They also share with us apparently the facility of developing a world-wide commerce. Under the circumstances, we fancy that it is high time that both our capitalists and our workers should be sufficiently impressed with the fact, that in dealing with American competitors they have to confront competitors of first rate ability, energy and resources. The only means by which they can hope to grapple effectually with such competitors, is by standing well together, and acting upon the principle of thoroughly harmonious action. Without such harmonious action the industrial future of the country must be regarded as gravely compromised.

### A Problem for Inventors.

The American Philosophical Society, of Philadelphia, in the year 1866, offered a premium of \$500 for a process for the successful utilization of anthracite coal dust, to be competed for under the direction of the officers of the society. This prize, says the *Iron Age*, is still open for inventors. Attention is now called to the fact because Mr. J. E. Wooten gives notice to the society that he is ready to compete for the prize. This induces the society to prepare for the trial and to renew their invitation to all inventors to enter their processes. Mr. Robert Briggs, whom we believe to be an officer of the society, writes that Mr. Wooten's process is burning the material on a perforated grate, with closed ash pit and steam-jet blast, the coal slack being spread thin on the grate, the latter portion of the process being secured by a patent.

The following is the form for an application to the committee to take notice of an inventor's process:

To the American Philosophical Society: I have been informed that a premium has been offered by the society for the utilization of what is known as coal dust.

Without special reference to such a premium, I have had in operation in that direction a process, and the results are so satisfactory, and, I think, conclusive, that I desire to submit them to a committee of the society for examination and report thereon.

Should my process be deemed worthy of the premium offered, I shall feel highly honored. Respectfully,

Concerning the above, Mr. Briggs says: This offer has been a standing one until the present time, but an applicant for the award having presented himself, the society has now appointed a committee to consider the subject. Application

tions with evidence and description can be sent to the society at any time during the next three months, until which time the action of the committee will be deferred to allow every method proposed or in use to be properly represented in the competition. Considering the almost national importance of the utilization of the immense quantity of waste fuel now accumulated and accumulating in the form of dust at the mines, this step of one of the oldest American scientific societies possesses the highest interest, and the premium offered bids fair to bring to publication the various methods now proposed to accomplish the desired result. The accompanying form will serve to give an idea of what is necessary for an application.

### A Substitute for Brass.

A very beautiful new alloy, intended to replace brass in various ornamental uses, especially in window and door furniture, has been invented by Mr. W. A. Hopkins, of Paris. The alloy is composed of copper, tin, spelter or zinc and lead, which metals are manipulated. A crucible is placed in the furnace and fired to a red heat, and into the crucible thus heated the metals are placed in the proportions of—tin  $1\frac{1}{2}$  (say) 1 oz.; spelter or zinc,  $\frac{1}{2}$  oz.; lead, 5-16ths of an oz. These are the proportions he prefers to use, as he has found them to give excellent and satisfactory results, but he does not intend to confine himself rigidly to the precise proportions named, as they may, perhaps, be slightly varied in some particulars without materially detracting from the beautiful color of the alloy which it is intended to produce. The molten metals are kept well stirred, and any impurities therein should be removed. When thoroughly mixed this alloy, which is termed the first alloy, is poured off into ingot molds and left to cool. Copper in the proportion of eight parts to one of this first alloy is then placed in the crucible and brought to a melting heat, when the tin or first alloy is added and intimately mixed with the copper, for which purpose the molten mass must be well stirred for several minutes. It is then poured into ingot molds for sale in the form of ingots, or it may be poured into pattern molds, so as to produce the articles required. This is the mode of manipulation which it is preferred to employ, as an opportunity is thus afforded of removing any impurities from the first alloy before mixing it with the copper, but all the metals may, if preferred, be mixed together in the proportions given and melted at one operation. By this means an alloy is obtained of great strength and of a very beautiful appearance, and which is particularly suitable for small work, such, for instance, as window and door furniture and other house furniture, which is usually made in brass or other alloy of copper, though it is not intended to confine its use to such articles.

**LOSS FROM OXIDATION.**—In advocating the use of better machinery in iron making, Mr. Holley, in a recent address, said: "Do iron-makers realize the enormous loss due to oxidation? An iron-rail mill making 40,000 tons of product, heating all the material twice and oxidizing not less than 8% of it at each heat, would, at present prices, burn up more than \$200,000 worth of iron a year. Upon averaging a number of results, I find the saving in the oxidation of iron in regenerative gas-furnaces, as compared with coal-furnaces, to be over 3%. In one case of first-rate practice with both furnaces, on small iron billets, it is 3.32%; in another case of good average practice on large iron piles it is 4.45%. In heating iron piles for plates, the waste in the ordinary furnace has been in some cases as high as 15%, while in Siemens's furnaces, which have been substituted in the same works, it has been as low as 4%. The smaller of these savings would amount, in the rail practice we are considering, to some \$70,000 per year, which would pay for half the labor on rails, or it would pay above 20% on the cost of a rail-mill. The oxidation of steel is somewhat less in either furnace, because the required temperature is lower; but the proportion of loss appears to be about the same, so that the economy of the gas-furnace is also very important in heating steel.

**THE COST OF LUBRICATION.**—A few days ago a gentleman well known as a manufacturer of railroad material called at the office of the *Railroad Gazette* and propounded the question: "What does it cost to oil railroad cars?" We referred to Mr. Fink's reports of the Louisville and Nashville railroad, and found there that the cost of oil and labor of applying it is given in the report of 1875-76 both for passenger and freight cars, and also the total distances run by each, from which the cost per car mile is of course easily deducible. This cost is as follows: Cost of oil and waste per car per mile, passenger, 0.221 cents; freight, 0.094 cents. Cost of labor per car per mile, passenger, 0.066 cents; freight, 0.039. Total cost of lubrication per car per mile, passenger, 0.287 cents; freight, 0.133 cents.

**IRON IN FRANCE.**—The iron trade of France is improving. The business done in 1876 was: Pig, 1,422,500 tons; iron, 861,000; steel, 247,000 tons, or a total of 2,625,000 tons. As against 1875, the make of pig was greater by 33,309 tons; the finished iron less by 21,170 tons; that of plates greater by 205 tons, and steel, 4,004 tons.

## SCIENTIFIC PROGRESS.

### Questions for California Botanists.

Dr. Asa Gray writes to the *American Journal of Science and Arts* a brief communication to describe a peculiar structure which *Megarrhiza Californica* exhibits in germination, and to call for observations upon other species, at the time of germination, in the hope of thereby extending our present imperfect knowledge of this genus of high-rooted *Cucurbitaceae* of our Pacific coast. For the extraordinary peculiarity in question, being one which, in other cases, is known to exhibit itself in certain species of a genus (as in *Anemone* and *Delphinium*), and not in others, so it may in the present genus give aid in distinguishing the five species which have been characterized upon more or less incomplete or scanty materials.

After reviewing the points in the known history of the plant, as recorded by other observers, Dr. Gray writes as follows: The *M. Californica* had been raised in the botanic garden of Harvard University many years ago, but I had not seen the germination; and we were never able to bring the plant into blossom, as it invariably died down to the ground soon after making a moderate growth. On germinating some fresh seeds early this spring, I was somewhat surprised to find that they came up in the manner of beans. Instead of remaining hypogaeous, as from the great thickness of the cotyledons would have been expected, the body of the seed in its shell was raised well out of the soil upon what seemed to be a well developed radicle, like that of *Echinocystis*. If the cotyledons had expanded, though remaining fleshy, in the manner of *Phaseolus*, the difference between this and *Echinocystis*, with cotyledons truly foliaceous in germination, would be much less than had been supposed. I waited long to see if this would occur; I also waited in vain for the expected development of the plumule from between the bases of the fleshy cotyledons. After the lapse of about a fortnight, the plumule in all three of my germinating plantlets came separately out of the soil of the pot. That is, the plumule came forth from the base of what appeared to be an elongated radicle (of two or three inches in length); and below this the thickening of the root, which acquires enormous dimensions in old plants, had already commenced. A large amount of the nourishing matter stored in the cotyledons had been carried down to the root and used in its growth as well as that of the plumule. The latter came from a cleft at the very base of the seeming radicle, which otherwise appeared to be solid. But on cutting it across toward the base this was found to be tubular; and later, when more spent and beginning to wither, this stalk was separable from above downward into two parts.

This, therefore, is a case in which long petioles to the cotyledons (of which there is no appearance in the seed), connate into one body, are developed and greatly lengthened in place of the radicle, which is thus simulated. It is the same as in *Delphinium nudicaule* of California and some other species; only in that genus the cotyledons expand and become foliaceous.

Botanists on the Pacific coast are earnestly requested to examine the germination of all the species of *Megarrhiza*, and to compare with them the descriptions which are here given. At least three species should be met with near San Francisco, and in neighboring parts of California. According to the characters assigned by Mr. Watson in the "Botany of California," *M. Californica* should be known by its obovoid seeds, of less than an inch in length, with a small hilum at the narrow base; *M. Marsh*, by its numerous seeds horizontally imposed in a large fruit (of four inches in length), each seed roundish and depressed, flattened an inch in diameter and about half as thick, with a prominent lateral hilum. *M. muricata*, by a nearly naked fruit only an inch in diameter, containing only two globose seeds of half an inch in diameter. *M. Oregona*, which is known to occur from the Columbia river to the north of California, appears to have seeds resembling those of *M. Marsh*, but rather smaller; but they are not well known. The remaining one, *M. Guadalupeensis*, of Guadalupe island, off Lower California, is much out of ordinary reach, unless it should be found in the southern part of the State. Mature fruits and seeds of all the species are much desired.

**RUSSIANS AND TURKS.**—Scientific societies are turning their thoughts to war topics. At a recent meeting of the English Statistical Society, Mr. Ravenstein read an elaborate paper on "The Population of Russia and Turkey." The former of these empires has 84,584,482 inhabitants, the latter only 25,986,868, or, including Egypt, Tripoli, and Tunis, 43,408,900. The population of Roumania is 4,850,000; of Servia, 1,352,500. The population of Russia increases at the rate of 1.1% per annum, the increase amongst the Jews being at least double what it is amongst the Christians. With respect to Turkey, there exists no data for calculating the increase, though it is most probable that the dominant race does not increase at all, a fact accounted for by vicious practices prevailing amongst the women, and by the sacrifices demanded from it for the defense of the empire. Some curious facts were communicated with respect to the proportions between males and females. Throughout Asiatic Russia and in a considerable portion of European Russia the

male sex preponderates. The same fact has been noted in Roumania, in Greece, and in other parts of Europe. The author thus summed up the results of his investigations:—In the Russian empire there are 100 Russians to every 50 members of other nationalities, and 100 Christians to every 16 Mohammedans and Pagans. In Turkey, on the other hand, 100 Turks have opposed to them 197 members of other nations, and 100 Mohammedans to 47 Christians. The advantage, in both these respects, is therefore entirely on the side of Russia, and the position of Turkey must appear in a still less favorable light if we look at the details of the geographical distribution of the dominant race and religion, and bear in mind the interest existing amongst Slavs and Greeks on behalf of some of the races dwelling within the limits of that empire.

**COMETS IN THE SPECTROSCOPE.**—The spectra of the three comets of the year, says the *Independent*, have been examined by a number of observers. Those of the first and third present no special peculiarity. They show the same three bands which have been found in the spectra of nearly all the comets hitherto observed. These bands, it will be remembered, are sharply defined at the less refrangible edge, but shade out toward the blue end of the spectrum, and seem to coincide exactly with three bands which are seen whenever a hydro-carbon gas is burning with oxygen. The flame of a Bunsen burner or the blue part of a common coal oil lamp flame shows them beautifully. From this coincidence the presence of some form of hydro-carbon has been inferred in comets. Hitherto only a single comet—that of Brorsen, observed by Huggins, in 1868—has shown anything different; and, as that comet was very faint and was observed with apparatus inferior to what is now at command, it was generally considered probable that the reported difference might be a mistake. The second comet of this year and the brightest of the three shows, however, according to the concurrent testimony of nearly all the observers, the same spectrum as Brorsen's—i. e., three bright bands diffuse at both edges; the middle one nearly in the same position as the middle hand of the ordinary comet spectrum, but the other two both less refrangible than the extreme bands of the ordinary spectrum. The spectrum of the nucleus was nearly continuous, indicating considerable density.

**RELICS IN A NEW YORK CAVE.**—The *Oreonta* (N. Y.) *Herald* tells of a cave which some hunters found by accident near that place. After procuring lights, rope, etc., they again entered the tunnel, which, though damp and dripping at the entrance, soon grew dry and dusty, protected by the sheltering rock above, and was filled with pure air. At a distance of 50 feet it terminated in a cave about 20 feet square and nine feet high, with a very irregular roof of flinty rock; and here came the remarkable part of the discovery. In one corner lay a heap of seemingly small rocks, covered with dust, but which on examination proved to be nuggets of pure lead weighing in all about a ton. Beside it, half buried in dry earth, a partly decayed skeleton, the skull and larger bones almost perfect, and scattered about were several curious copper implements. There has long been a legend extant among the old settlers here of a lead mine in the neighborhood, and of the Indians bringing in lumps of lead but refusing to tell where they were obtained. Probably it was brought from the lake region, and this cave was made a store-house, and the skeleton was that of an Indian.

**MICROSEISMIC OBSERVATIONS.**—Father Bertelli, according to the *Journal of the Franklin Institute*, after discussing more than 20,000 observations, made from 1870 to 1875, reaches the following conclusion: The oscillations of isolated pendulums are generally parallel or perpendicular to the axes of valleys or mountain chains. The oscillations are not dependent upon local vibratory movements, nor on the velocity or direction of the wind, nor on rains, nor on thermometric or electric changes. The tectonic movements are most vertical at the time of earthquakes. The positions of the sun and moon seem to influence the movements of the pendulums, but they are especially frequent when the barometer is low.

**A NEW EXPEDITION.**—Prof. Nordenskjöld's great expedition, for which a vessel has already been chartered at the price of 150,000 crowns, is to leave Gothenburg in June, 1878. It is to circumnavigate the whole of Asia through the Polar sea, the Behring straits, along the east and the south coast of Asia, and to return to Europe through the Red sea and the Suez canal in the autumn of 1879. King Oscar has contributed 50,000 crowns towards the expedition. The principal expense of the expedition will be borne by Mr. Dickson, a merchant of Gothenburg.

**A SCHOOL FOR MILLERS.**—At a recent convention of the United States Millers' Association, Mr. Frank Chamberlain, of Albany, N. Y., offered the following resolution: "Resolved, That a committee of three be appointed by the President to take into consideration the subject of establishing, under the patronage and guidance of the Millers' National Association, a school or college for instructing and educating millers, and, if practicable, to report a plan therefor at the next annual meeting of this body." The resolution was adopted.

# MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

### AMADOR.

**HALL CLAIM AT WEST POINT.**—Ledger, July 14: The other day we were shown several specimens of quartz taken from the Hall mine at West Point, in Calaveras county. The ore ranks among the richest we have ever seen. Each piece of rock shown us must have contained from \$10 to \$20 in free gold. The vein from which these rich specimens were taken is 23 inches wide, and the lead is as pregnant with gold as the piece we saw. An effort will be made to take out a solid chunk 2x30 feet, for the purpose of sending it below for exhibition. F. C. Hall, of Jone City, is the sole owner of the property.

**ORAVEL MINING.**—Messrs. Payne and Young, representing San Francisco capitalists, have been around Jackson the past week, with the idea of negotiating for a number of gravel mines, and working them on an extensive scale. The conditions are that the buyer embrace the California claim, at French hill; also the claims of Truab & Bellard, and the Austrians in the neighborhood; also W. Moon's mine and a claim belonging to F. M. Brown, at Stony Creek. The parties contemplating the enterprise are making arrangements to secure the surplus water of the Amador canal, which will amount to nearly 2,000 inches, the company to receive a percentage of the proceeds in payment for water.

**HINCHLEY.**—The lessees, Messrs. Killo & Stribley, started work on their mine last week.

**BONANZA.**—S. S. Manon tells us that the Bonanza is looking exceedingly well. Sinking operations are through with for the present. The mill was started on the rock early this week, and will probably run steadily through the summer if the water holds out.

### CALAVERAS.

**WIN MINN.**—Calaveras Chronicle, July 14: There is no feinting of the remarkable yield of the Gwin mine. The ledge continues as rich as ever, and the output of ore is sufficient to keep the batteries constantly supplied. The rock is exceptionally rich, the yield bordering on the enormous. An average of \$11,000 per week is being cleaned up, which, for 24 stamps, is marvelous. The vein is by far the richest mine in the State. Upwards of \$50,000 has already been taken from the 1300-ft level, and it isn't fairly open yet. The level will unquestionably bring a million. Sinking for the 1400-ft level has been commenced. Additional batteries are to be set at work, and when the stamps are all employed it would be a low estimate to set the yield of the mine at \$30,000 per week.

**TIGER.**—Work has been temporarily suspended on the Tiger mine, at Rich gulch, for the purpose of making extensive improvements. The mine is to be incorporated, and we learn that a strong combination of San Francisco capitalists is prepared to take hold of the property. During the latter part of the coming September a 40-stamp mill is to be erected and the mine furnished with everything that can facilitate its advantageous working. There is no question but that the mine is a good one, although with the limited appliances at present available, it is not largely remunerative. The ledge is an immense one, covered from 10 to 15 feet in width, and it has been uncovered several hundred feet.

**AUSTRIAN.**—We continue to hear the most favorable reports from the Austrian mine, at West Point, the property of the Enterprise Co. M. C. The sinking of the new shaft is being prosecuted vigorously, a depth of 115 feet having already been reached. The ledge is showing magnificently. There is not an ounce of ore in it, so far as uncovered, but what will yield an average of \$20 per ton.

**UPPER COUNTRY ITEMS.**—Smith & Gouldson lately had 13 tons of ore crushed in Henry's mill, near West Point, that paid \$50 to the ton. Arthur & Porteus milled nine tons that paid an average of \$30. Hall's new mill on the Zacatoro—10 stamps—will be ready to start next week. Rich rock has been struck in the mine.

### EL DORADO.

**CENTENNIAL HITES.**—Amador Ledger, July 14: A few weeks back we mentioned that a large quantity of cube sulphur, bearing gold, taken from the Centennial Hites mine, was hauled to the Bonanza mill, at Drytown, for crushing. Forty tons were put through last week, and the result is a matter of astonishment to all, the yield being at the rate of \$20 per ton. It must be remembered that this result is obtained after the ore has undergone a thorough sluicing at the mine, and all the free gold captured.

### INYO.

**EMIGRANT COMPANY.**—Como Mining News, July 14: Peter Taylor, Superintendent of the Emigrant company's mine, came in from Lee last Tuesday, having got their five stamp mill in the finest working order. A greater supply of water has been obtained, and it is thought that the mill will run at a profit. A wonderful development is being made on both the Actus and Valentine mines, particularly in the former, where, at a depth of 45 feet, a 6-ft vein of \$400 ore has been struck in one shaft, while in another, some 30 feet deep, a 4-ft vein of the same kind of ore is encountered.

**MINNETTA BELL CO. COMPANY.**—W. E. Brown, Superintendent, brought in from R. C. Jacob's mill, last Tuesday, 10 tons of bullion, valued at something over \$6,000, which was shipped below the same day.

**NEW COSO.**—Two of their furnaces are now running, but we understand they will shut down in a few days for general repairs. The work on the mines is now done by contract, and consists of sinking to a greater depth and cross-cutting, so as to stop the ore from above. This accomplished, the furnace will again start.

**MONROE.**—A. Strong, Superintendent, says that everything is looking well in the mines; the two furnaces are running, but coal and water are a little short of the required demand.

**DEFIANCE.**—We made a trip up to the old Defiance last Tuesday, being the only one for a long time, for the reason that all labor had been concentrated at one point, for the purpose of running a drift from the main hoisting and Valine back to the second and third levels. A long time was consumed in making the connection with the second ledge, the rock being so hard that only from eight to ten inches per day could be made. The second ledge was reached, where some ore was encountered, but in limited quantities, it being in streaks and small pockets. The ledge itself is one of the strongest we have ever seen at a depth of 300 feet. The walls are perpendicular, and are carrying the scaly clay seam and being quite damp. It is evident that they unfortunately ran into a barren spot where the connection was made, but there is not a doubt but that further exploration, both by drifting and sinking, will develop an immense body of ore. We are confident of this, for the reason that the level directly above the ore was reached in large quantities.

We now proceed to the Hidalgo mine, owned by the Santa Rita M. & S. Co., situated a few hundred yards north from the Defiance. Wednesday last 10 tons of the very best carbonate and galena ore was taken out. They are down a little over 100 feet, and are drifting south from the shaft. There are two fine walls, carrying the scaly clay seam, and found in the Defiance. At a depth of about 75 feet it was at one time thought that the ledge was about to "pet out," but at the present depth it has widened out to nearly four feet and rapidly increasing. We notice that the ore vein in the Hidalgo is pitching directly toward the Defiance, and we hear the same thing of the Cuervo, and as these two mines are situated to the north of the Defiance, and are more elevated, we naturally conclude that the Defiance must go down deeper.

**CHATTANOOGA.**—This splendid property, owned by Say-

lor, Wallace & Riddle, situated some five miles from Darwin, is proving itself worthy the attention of those who desire to invest in big things. It has been developed to a considerable extent, and so far, from the richness of its ore, which have been shipped, and the money received therefor, has been able to pay for all expenses from the start. The ore which has been shipped has averaged a little over \$1,000 per ton, while several tons, averaging \$400 per ton, have been sold here.

**NOR REDDEN.**—Inyo Independent, July 14: The Silver Sprout mine and mill property, not having been redeemed from the Harris & Rhine judgment within legally prescribed time, has passed into the absolute ownership of that firm. It is understood, however, that the flex Month men have purchased the mill.

**CERRO GORDO.**—The Union Co. company took occasion on the Fourth to shut down the Beaudry furnace and overhaul the boiler and water jacket, which will be the work of but a few days. Ore is being extracted from the lowest level, and a raise is being made to connect the new level with the old one, after which a much stronger force will be put into the mine and probably the other furnace started up.

### NEVADA.

**MASSACHUSETTS HILL MINES.**—Grass Valley Union, July 12: The Gold Hill mine, the oldest in the district, is now being dug again, after years of idleness. This ought to cause Massachusetts hill to be put in working condition. We understand that parties interested in the Massachusetts hill properties have lately held a meeting, and that a disposition to resume work there was strongly manifested. Starting up the Massachusetts hill mines would be of incalculable advantage to the business and prosperity of this town, and will result in great gain to the owners of those mines.

**MINING ENTERPRISE.**—The Massachusetts Cong. Yuba River M. Co. own a set of claims six miles long, on the Yuba river, commencing at the mouth of Deer creek and extending up the river. Some of this ground was worked in former years and proved extremely rich. Much of it, however, has not been worked down to bedrock, where the most of the gold is found. The company named will work by sinking an incline on the side of the river bed, and then drift under the channel. Practical and experienced men assert that to be the true way to work the river bed.

**NEW ENGLAND.**—Nevada Transcript, July 14: Work is progressing splendidly at the New England mine. The new hoisting works will be in operation in a few days. The new incline is down about 100 feet, and has reached and passed the present level; it is now being continued on down toward the next level, through a body of exceedingly rich ore of an average thickness of two feet. The California mill is now crushing ore from this mine at the rate of 20 tons per day.

**THE LEE.**—Nevada Gazette, July 14: The tunnel being run by the Deadwood company to tap the ledge being longed to them situated at Willow hill, near Kitter's mill, is now in over 620 feet, and progress is being made at the rate of 10 feet a week. The last 50 feet has been in rock as hard as it is possible for rock to be. The tunnel is substantially timbered about 600 feet. The work has all been done inside three months. It is expected to strike the ledge in less than a month, and the company has a good prospect ahead of them. The ledge of the surface has been very rich and will doubtless be at the point tapped by the tunnel. Another ledge three feet in width was struck while running the tunnel, the rock from which looks well.

**TIGER.**There has been considerable prospecting going on up at Big Canyon creek, Washington township, this spring and the results have been very satisfactory. The extension of the Yuba lead has been thoroughly prospected and the rock, with the exception of a few feet, is all good. S. B. and PERCIVAL DAYTON are running on a ledge located near Deer creek, above the County House, which is said to be of good size and which prospects first-rate. Rock was taken from the same ledge years ago, and when crushed yielded handsomely.

**AT THE BLUE TENT.**Hydraulic gravel mine there will be 900 tons of powder exploded in one of the high banks of the lower river. The Superintendent, Mr. Hughes, informs us that water is plenty and that work will be continued for some weeks yet.

**THE ROMAN QUARTZ LEDGE.**which runs beneath the National hotel, has been purchased recently by the Nevada County Co-operative mining company and the work of development will be pushed ahead as fast as circumstances will permit. There is a tunnel in now between 300 and 400 feet on the ledge and it will be pushed ahead all farther. Rock from this vein when discovered in 1850 was said at the rate of \$250 per ton.

### PLACER.

**YANKEE JUNE.**—Cor. Placer Argus, July 14: Although the dry season has left us nearly all on the bedrock, we still have good reason to hope for better times soon, because the whole Divide is now attracting the attention of capitalists, and there is no better field for such men to operate. I am glad the Divide is now receiving the attention it deserves. Our drift miners are doing well, and the luck is coming their way. There is quite an excellent here now in regard to quartz, and every miner and boy in town has an "extension" on a ledge discovered one mile below here by T. G. Durning, about six weeks since, which is large and well-defined, and prospects well in free gold. The rock is a bluish-gray. Two companies are working on it. One of them, the Mastodon, is composed of T. G. Durning, John S. Mendonza and M. B. Tully. They have sunk a shaft 20 feet deep, and have started a tunnel that will strike the ledge about 150 feet deep. The Live Oak company, the first north extension, is owned by the Gilbert brothers, who are running a tunnel. They will strike the ledge at a depth of about 60 feet. Now is the time for quartz men to invest. We need a mill, and hope to have one, as one of our extensionists has located a mill site.

### PLUMAS.

**THE BLUE ORAVEL COUNTRY.**—Plumas National, July 14: We made a trip on Wednesday to the mines about Nelson point. The Franklin company are sinking slowly, but they have reached the ledge at a depth of 125 feet, and is now down about 125 feet; the lava is of a darker color than that above, and large boulders becoming plenty. Any quantity of small, washed gravel comes up in each tub, and the indications are strong that a few feet more will let them into the lead. Mr. Lacy is at the mine, and seems to think the chances A No. 1. At the Blue Gravel mine we found the work progressing splendidly. The boys are taking out some gravel, which, like all the balance in the claim, prospects well. They have commenced washing, but as yet have made no clean-up. The bedrock is pitching into the mountain—a good indication.

**KEYSTONE.**—We are told that the new mill at this place, near Argentine, has been running for the past three weeks, and the owners, Messrs. Walsh & Dawson, are well satisfied with the result. The ledge looks well as far as developed, and there is no reason to doubt the success of the enterprise. There should be more prospecting done in that section. All of the gulches paid well in quartz gold, and there are certainly some grand old ledges that "feed" them. Massac gulch turned out some of the finest specimen of rough, ragged quartz gold ever seen in the county, and no ledge has yet been developed at or near the head of it.

**THE BELL MINE.**—We took a look at the new quartz mill the other day, and found the work progressing favorably. The work is under the direction of Mr. Pelton. First J. H. Varied, of Camptonville, is also doing some first-class work on the new mill. The boiler is in place, and the work is being pushed up the river. The mine is being put in as fast as possible. Ten stamps will be started and more will be put in when the mine is opened properly. The workmen were taking out some fine looking rock, and we were told that it prospects well. The ledge in the face of the drift looks well, and everything indicates that the first run will prove that the mine is a success. The mill will be started up the next day, and there is a great deal of good quartz in that neighborhood, and the success of this mill will have the effect of starting up several more.

### SIERRA.

**SUPERANDED.**—The Ploocene company has suspended work for a few days, on account of being obliged to put tubing in their shaft, having struck sand. This will necessitate enlarging the bore a trifle. Sinking will be commenced again in about a week.

**RICU AS EVER.**—The North Fork mine continues as rich as ever. Some fine specimens were taken out a few days since.

**GILSONVILLE.**—The mining interests here are prospering, with a bright outlook ahead. The Union Chaledon, and Keifer & Emerson, and Gravel Hill company's claims are still yielding rich returns. Hydraulic mining is closed for the season. Near 100 men are being employed hereabouts, scarcity of water for mining purposes causing a large reduction in the working force of the claims. Most of the gold in this section is rather coarse.

### TRINITY.

**DEADWOOD QUARTZ.**—Trinity Journal, July 14: From developments made to date there seems to be no question as to the richness and great extent of gold quartz on Deadwood, and new and rich discoveries are still being made. George Klein, the original discoverer of the district, first went there from French Gulch, Shasta county, in 1872, erected an astrak in 1873, and has worked there ever since. Klein was in town this week and says that in his last work he crushed 12 tons of rock in 20 days with his astrak, and took out 56 ounces of gold. The quartz is rich at hand, but little work being necessary to get it out, as witness the fact that during 20 days Klein was running the astrak, a single man took out 70 tons of quartz.

### TULARE.

**MINERAL KING.**—Cor. Visalia Delta, July 14: It is now quite probable that the New England smelting company will not attempt to smelt the ore now being roasted until some ore richer in lead is found to use with it. Their Black Wolf tunnel is being pushed ahead as fast as the hardness of the rock will permit. A night shift was put on Sunday night. Two machine drills are expected here in a few days, and will be completed between the mill and the tunnel, and everything is being got in readiness to continue the work in a vigorous manner. A good tunnel has been made to the Empire tunnel, where prospecting is also going on.

## Nevada.

### BRISTOL DISTRICT.

**INUNCTION SUIT.**—Pioche Record, July 14: J. B. Vailancourt has brought suit against Garrison and Ewing, in the District Court of Lincoln county, for a one-third interest in the now discovery claim in Bristol district. The injunction will prevent the mine from being worked until bonds are given or the case decided.

### BULLION DISTRICT.

**THE LEE.**—Eureka Sentinel, July 13: Operations at the Lee mine have been suspended for some time. Mr. Gunnison, the original owner, expended \$80,000 in developing the property and erecting a mill, but notwithstanding that the ore was rich in lead, and the refractory nature baffled all attempts to work it profitably. Mr. Gunnison, after honorably settling all claims against the mine in full, sold the property to a couple of San Francisco capitalists, who, we understand, will renew work in a short time.

### CENTRAL DISTRICT.

**STRIKE.**—Silver State, July 13: From this district comes a report of a rich strike in the Silver Monarch, recently purchased by S. E. Holcomb. A ledge four feet wide, and carrying exceeding rich ore, is said to have been cut a few days ago in the tunnel on this mine.

### CORNUCOPIA DISTRICT.

**NEW CLAIMS.**—Cor. Silver State, July 16: The new finds just north of town are opening out splendidly. In the Athena they are down about 30 feet, with a well defined ledge 5 feet in width, 20 inches of which produces fine ruby silver ore, and assays way up. A lot of unassayed ore are assayed at the Leopard assay office went over \$300 per ton. The boys that own this claim are pushing the work ahead with vigor, and think they have as good a property as the Leopard ever was. The latter company are working more men now than they have at any time this season. There is also a large amount of wood being delivered at the mill, which shows that they mean to continue operations. The other mines are being worked in about the usual way, the Hussey producing a large quantity of good ore.

### ELY DISTRICT.

**RAYMOND & ELY.**—Pioche Record, July 14: There is no change; a little more than the usual quantity of ore is being extracted. The mill finished crushing the ore from the upper levels, and had started to crush the ore from the 1200-ft level, when the ore, which broke, so that nothing could be done in the way of crushing. Hardly enough of the new strike was crushed to take a battery sample, so that under the circumstances Captain Day ordered the mill to run on tailings for the balance of the month, and will start on the 1st of the month on the new ore.

**ALPS.**—The mines are now being placed in good shape, and the work of extracting the ore is satisfactorily progressing. The American Flag mill was started up on Monday last, the 15 stamps having been going ever since, together with 5 pans, running through from 18 to 20 tons of ore daily.

### EUREKA DISTRICT.

**HAMBURG.**—Eureka Sentinel, July 14: The furnace at the Atlas, which has been smelting Hamburg ore, will be run down to-day. An enormous impression prevails that the ore bodies in the Hamburg mine have given out. This is a mistake. They are as large and as rich in gold and silver as ever, but the percentage of lead is very small, so much so as to render the smelting very unprofitable. The Whim shaft, to the north of the main shaft, has furnished some six tons of ore per day, running very high in lead, and this has been mixed with ore from the chambers worked in the Pacific shaft. The ore was extracted from a drift running south 625 feet, bringing it in close proximity to the main shaft, but some 150 feet lower. Work had to be suspended in this shaft and level some three weeks ago on account of the foul air. Since that time the company have been competing with the other furnaces for the purchase of heavy lead ore, and finally come to the conclusion that it was better to shut down the furnace until such time as the proper connections are made. Mr. Powell informs us that they will probably start up again in about a month.

**THE LEMON MILL.**—The Lemon mill will be started by Messrs. Clark and Wallace to-morrow or Thursday. Extensive repairs have been made to the machinery since the gentlemen leased the property. It is expected that it will take a day or two after start-up is applied before the machinery will be in perfect running order, as it has become rusted by long disuse. The pans are not of the same pattern as those used in making the preliminary experiments at Salt Lake, but the gentlemen are confident that they can obtain good results from those now in the mill. The furnace is lessened the property. Consolidated fuel dust, and the process will be watched with great interest by all our mining and smelting experts.

### HUNTER DISTRICT.

**NEW FURNACE.**—Pioche Record, July 14: The pleasure of meeting James Day, just in from Hunter district. A 40-ton furnace is being erected, which will be started to work in September. About 60 men are at work for the Winnemucca company, which is composed of foreign capitalists, they having purchased from Bristol and Daggett. The company have the exclusive privilege of water, bringing it some two miles. A branch line of Oilier & Salisbury's Cherry Creek line stages was being run to Hunter this week. A postoffice has been established.

### MINERAL HILL DISTRICT.

**TO BE STARTED UP.**—Eureka Sentinel, July 14: Captain John Plummer, for a long time connected with the Lake Superior mines, arrived at Mineral Hill on Tuesday last,

and took charge of the English company's mining property at that place. The mine and mill have been the subject of much litigation among the English stockholders and was placed in the Courts of Chancery some time ago, since when no work has been done beyond the crushing of outside ores. Messrs. John Taylor & Co., who originally controlled the mine, have paid up all claims, thus removing it from the jurisdiction of courts. We understand that they do so on the report of a noted expert, and that they will expend a considerable amount of capital to improve the value of the property. Captain Plummer will employ quite a force of men in the various shafts and levels, and the diamond drill will be used to explore and determine the location of the ore bodies. Improved drilling machinery has been purchased and will soon be on the ground and at work.

### RAILROAD DISTRICT.

**PROSPECTS.**—Eureka Sentinel, July 12: Judge Watson, of Railroad district, has been in town since Sunday. The Judge speaks very encouragingly of the mineral wealth of Railroad district. He thinks that with a fair chance, in the way of capital to aid in the work of development, it would soon take rank as one of the very best mining camps in Eastern Nevada. The Judge himself has some splendid mines.

### REESE RIVER DISTRICT.

**EXCITEMENT.**—Reese River Reviville, July 12: For several days past there have been vague rumors of the discovery of rich new mines in the vicinity of Austin. The matter has been kept very quiet, but few beyond those directly interested knowing anything about it. But such things almost invariably leak out, and the departure to the discovery of a party with tools and supplies created a ripple of excitement. From where we could learn a woodchopper recently discovered the croppings of a ledge in the mountains above Silver creek and brought some of the rock into town and had it assayed, the result showing it to contain over \$500 per ton in silver. We have seen some of the croppings which were brought in. It is a porous quartz, carrying black sulphurets of silver and specks of horn silver and looks as if it might contain some gold. It is similar in appearance to the quartz in the croppings of the Comstock as found on the surface of the Gould & Curry mine and at Gold Hill, but does not look as if it would work \$500 per ton in silver, though it is very good croppings.

### SILVER CREEK DISTRICT.

**THE DISCOVERY.**—Reese River Reviville, July 14: From parties who returned from the new mining excitement at Silver creek, we got some particulars regarding the district. From T. W. Triplett we learn that James Heacock & Co. have located a ledge, which crops out for about 30 feet in length and about five feet in width, carrying ore which assays from \$300 to \$500 per ton. Other ledges have been located by other parties. Heacock & Co. have located a townsite near their ledge and also all the water in its immediate vicinity. Charles Richards, who has also visited the new mines, says the big ledge from which came the float which has been found on Silver creek for years past, have undoubtedly been discovered, but he is not prepared to speak as to their value.

### WHITE PINE DISTRICT.

**STRIKE.**—Eureka Sentinel, July 13: B. M. Howland informs us that a splendid development was made in the Stafford mine, on Treasure hill, last week. At a depth of 100 feet a 30-foot body of ore was struck, going from \$150 to \$300 per ton. The owners of the mine are F. M. Shinn, Sam. Paul and Johnny Flynn. They have commenced shipping ore to the mill of the English company at Eberhardt. The Stafford is now the only producing mine on the old mountain. The boys have stuck to it a long time, and are well deserving of the success which they are meeting with.

## Arizona.

**HACKBERRY.**—Arizona Enterprise, July 11: The latest news from the Hackberry in Mohave county, is in that the 430-ft level, south from the main incline, is in about 48 feet and shows a fine body of high grade ore. The character of the quartz and the ore extracted has greatly improved. The assays at present range from \$105 to \$452 per ton.

**FROM MR. HOLMES.**just arrived from Turkey creek, we learn that great activity is displayed in the different camps all over the district.

**THE PECK** continues to produce its usual quantity of high grade ore. On the Prince, Warrior and other claims in the district, steady work is carried on, and the mines are looking well.

**A NEW DISCOVERY** has just been made four miles southeast of town by Messrs. Leighton & Otto. Assays made from the croppings have gone as high as \$7,000 to the ton.

**MINING ON LYNN CREEK.**—This old camp, which in early days attracted thousands of eager gold seekers and produced hundreds of thousands of dollars, has, under the new departure after silver, to resume its ancient activity. The late strikes made in the district are attracting a great deal of attention in the mining world. The Zulu, Miriam, Maryland and other new finds are producing some wonderfully rich ore and giving every assurance of permanency as they are being sunk up.

**HONOLULU DISTRICT.**—On the Tex mine, Thompson & Schaffer are busy at work, and are taking out some very rich ore, which is being sacked ready for shipment. Foy & Co. are working on their claim and bringing to the surface some very high-grade ore. The great want of this district is a mill for the reduction of ores. Hundreds of tons of rock, which will run all the way from \$100 to \$300, is now lying on the surface, and the different mines waiting the coming of reduction works.

**BRADSHAW DISTRICT** has awakened from its long slumber and promises in a short time to regain its pristine glory. Its mines are many, large and rich; its facilities for milling cannot be excelled and its situation is all that could be wished for.

**HASAVATTA DISTRICT.**—The Senator is still yielding large quantities of fine ore, and the different stops and drifts throughout the mine never looked better. The mill keeps at work, steadily turning out its regular amount of bullion. On the Crook, Fiske & Co. are at work, and are getting out rock some of which will equal any ever taken from this very rich gold ledge. Owing to the scarcity of water the mill is not running at present.

**WAXBURG DISTRICT.**—The mining news from this section is of the most cheering character. The five-stamp mill is now at Peoples valley, and will be brought over as soon as the road is completed. In the meantime the claim owners of the district are busily at work getting out ore. Henry & Co. are running astraks, which runs from \$75 to \$100 per ton. To sum up the mining situation, the camps of Yavapai never presented a livelier appearance. From one end of the county to the other general activity prevails.

**FROM MOHAVE COUNTY** we learn that considerable activity is displayed by the miners in Cedar valley and other districts in the southern part of the county. Uroth the McCrackin there are 15 miners at work taking out ore. The dumps are full, and a large quantity of ore is now being shipped to the mill at the mouth of the river. The 10-stamp mill at Greenwood is running night and day and turning out a large quantity of bullion.

## Colorado.

**RED ELEPHANT.**—Colorado Miner, July 14: The miners and prospectors on this mine are still continuing to develop, surprising degree of activity and energy. Prospecting for general results is extensively indulged in, and with that determined persistence which is as necessary for success in the avocation of mining as in any other pursuit. New ground is broken nearly every day, and an earnest desire to become suddenly wealthy is a common characteristic of Red Elephant miners.

**FLAT IRON.**—Messrs. Lang, Arnold and Renwick are

## THE ENGINEER.

### Registering the Gauge of Railways.

It is of course very necessary that the gauge of the rails should be true and uniform under similar conditions. To determine this the track master's gauge is slow of application, and can only be applied to each point of the line at considerable intervals. We read that for controlling and graphically registering the width between the rails, Mr. J. Hochgrassl, assistant engineer of the European Turkish railways, of Usun Kopri, near Constantinople, proposes an apparatus which is by preference fastened to a trolley, and works automatically during the course of the same with great accuracy. The apparatus has two wheels of cast-iron provided with flanges. These wheels move with their axles each in two sockets riveted on an L iron, which is fastened on the said trolley by means of a pole. One wheel is by a projecting piece of the axle and by a pin with a retaining plate held in its place, whilst another wheel by means of the spiral spring slides to and fro according to the width between the rails. In the middle of the horizontal L iron is mounted a T-shaped support on which rests the registering apparatus and writing instrument. The whole frame is by means of small chains suspended on two flat springs, which project from the trolley whereon they are fastened. The suspension is effected in such a manner that the stationary wheel is always pressed against the rail, while the other wheel moves on the rail almost without any friction.

The sliding of the movable wheel corresponds to the actual width between the rails, and is communicated to the writing pen by means of a lever turning round its point. This lever is forked, and is placed with its forked end in a groove of the movable shaft. Between the writing pen and a metal plate moves a paper strap or hand. This strap is moved forward by passing between drums, one of which is turned by means of small wheels and an eccentric. The rolling of the paper strap on the cylinder is effected by means of another wheel; the axle of one wheel has a conical end. On this axle is a cylinder which by means of a screw or screws is pressed in such a manner that the said cylinder can slide on the axle according to the increasing diameter of the paper roll. A drum provided with rows of small pins draws on the paper strap by two parallel dotted lines the normal width between the rails, whilst the deviations from the normal width are drawn by a single line. The beginnings of curves and the like can easily be marked on the paper band by the attendant on the trolley. The aforesaid pressure screws have for their purpose to regulate the rotation of the said cylinder and drum.

### What Has Been Done in the Mississippi.

Chief Engineer James B. Eads has just made a report to the South Pass Company, from which we take a concise statement of what has thus far been done with the jetties: Our works were begun two years ago in an unused outlet of the Mississippi river and have necessarily disturbed the regimen governing the outflow to the sea of an enormous volume of water; but the theories upon which they were based have been fully vindicated by the results produced; and it is now manifest that entire and complete success will reward our labors. Among the prominent results developed by our operations are the following:

1. The concentration of the water flowing across the sand-bar at the mouth of the pass by the jetties created a channel over 200 feet wide, in no place less than 20 feet deep, where only about eight feet previously existed.
2. The concentration of the water flowing over the shoal in the river at the head of the pass created a channel over 400 feet wide, in no part of it less than 20 feet deep, with the central part 30 feet, where but 14 feet previously existed.
3. During the time in which a portion of the flow into the pass was interrupted by the works at its head, and the current consequently slackened, a temporary deposit took place in the pass and between the jetties.
4. The gradual restoration of the normal flow into the pass through the new channel at its head has already begun to enlarge the pass again, and has, since this restored flow commenced, removed from between the jetties within the past three months over half a million cubic yards of deposit, and given through more than half the length of the jetties a much larger and deeper channel than ever previously existed, the size of which is already throughout more than 2,000 feet, 28 feet by 300 feet, or that required to entitle us to the fifth payment from the United States, while many hundred feet of it exceeds 30 by 350 feet.
5. The gulf current athwart the jettied mouth of the pass effectually prevents the re-formation of the bar in advance of the jetties by deepening the outer slope of the bar, and sweeps away any such portion of the discharged sediment as the river current fails to carry to unknown distances seaward.
6. The Mississippi river at the head of the passes, where it has a width of over 9,000 feet, is brought under complete control by our works, which are so designed as to enable us to increase or limit the discharge into our pass,

if hereafter necessary, with but little additional outlay.

7. Finally, I may add with absolute certainty, that this entire system of works is now so far completed that no financial difficulties can intervene to arrest the processes of nature which are constantly operating to enlarge and perfect the desired channel through them.

### A Field for American Enterprise.

A communication from Mr. James V. Thomas in the New York Times presents the following facts bearing on the proposed isthmus canal: "You have perceived that in this communication I address myself to two arguments; the first, that of navigation, and the other what I may call colonial development. A Nicaraguan canal would make New York the central commercial city of the world, and make San Francisco her associate. But it would do more; it would give American planters, mechanics and merchants an immediate and a near field to create another India in place of that which is rapidly forestalling even our domestic productions. Hot and heathen India, as we presume to call it, sent nearly 3,300,000 hundred-weight of wheat to England last year—one-sixth as much as the United States, one-third as much as Russia. No land can compete with the infinitely versatile conquest of England in the East, except tropical America. With a foresight that was almost unparalleled in national economy the British government began, at the close of the American revolution, to compensate in India for the loss of North America. The year of Cornwallis's defeat at Yorktown signaled the final defeat of Hyder Ali, and the Marquis Cornwallis was sent to preside over India before the adoption of our Constitution. In 1853 the East India Company ceased to exist, and 18 years thereafter the queen added to the jewels of her crown that of the 'Great Mogul.' No portion of her dominions is more easily ruled; none gives so extensive a field of investment and return. The British revenue from India is \$250,000,000 a year, or nearly the total cost of operating the United States Government. The British army in India employs and subsists 200,000 of Her Majesty's subjects, and controls 240,000,000 human beings. They make a commerce of \$500,000,000 a year, cotton, jute, rice, tea and indigo leading. They give employment to 19,000 vessels and to 6,500 miles of Indian railroad, in which \$500,000,000 find profitable investment. India at first was a most discouraging region for enterprise, with its terrible climate and dense and fierce population. In Spanish America, which repeats nearly every natural production of India, and adds many others exclusively its own, there are less than 30,000,000 people, more than two-thirds of whom live on the Pacific slope; they are weary of revolutions, ripe for orderly government, hospitable to strangers, and more frugal than ourselves. They lack those things in which we are most redundant—organizing power, machinery, practical purpose and influence over European commerce.

### Suspension Bridges Invented 1,600 Years Ago.

The most remarkable evidence of the mechanical science and skill of the Chinese at this early period is to be found in their suspended bridges, the invention of which is assigned by "Thornton's History of China" to the Han dynasty. According to the concurrent testimony of all their historical and geographical writers, Shang-leang, the commander-in-chief of the army under Kaou-tsoo, the first of the Hans, undertook and completed the formation of roads through the mountainous province of Shen-se, to the west of the capital. Hitherto its lofty hills and deep valleys had rendered communication difficult and circuitous. With a body of 100,000 laborers he cut passages over the mountains, throwing the removed soil into the valleys, and where this was not sufficient to raise the road to the required height he constructed bridges, which rested on pillars or abutments. In other places he conceived and accomplished the daring project of suspending a bridge from one mountain to another across a deep chasm. These bridges, which are called by the Chinese writers, very appropriately, "flying bridges," and represented to be numerous at the present day, are sometimes so high that they cannot be traversed without alarm. One still existing in Shen-se stretches 400 feet from mountain to mountain, over a chasm of 500 feet. Most of these flying bridges are so wide that four horsemen can ride on them abreast, and balustrades are placed on each side to protect travelers. It is by means improbable (as M. Panthier suggests), that as the missionaries in China made known the fact more than a century and a half ago, that the Chinese had suspension bridges, and that many of them were of iron, the hint may have been taken from thence for similar constructions by European engineers.

THE WASHINGTON MONUMENT.—At a recent meeting of the Washington Monument Association, General Meigs submitted a plan to terminate the present structure with a metallic spire 140 feet high, making a total length of 442 feet, and a column resembling the tower in the public square of Venice. The additional weight will be 4,147,000 pounds. General Meigs also approved the plan of Larkin G. Mead, to complete the monument by placing a colossal statue of Washington upon the present structure. This figure of Washington will be 85 feet in height.

### Systematic Mining.

We shall not name examples, as it might be inferred that in our opinion all others were badly managed. But it must be admitted by every candid judge that a considerable portion of our mines are not systematically worked. In many cases this is due to a lack of experience or judgment on the part of the managers, and in others there is a lack of capital to put the mine in proper condition so far as timbering, buildings, hoisting facilities and roads are concerned.

Systematic mining does not necessarily imply an extensive mine, a large force or an expensive administration. A prospector who locates and records before tracing the course of his vein, begins without system and not infrequently loses part of his lode by its passing outside of his side lines. The miner who sinks a small corkscrew shaft from the surface, works without system. If he expects the lode to prove a good one, he should make his shaft a size and shape that will not require any change or enlargement. It costs no more to do it well than to do it badly. If he does not expect the lode to prove valuable he should not waste his time upon it. There should be a well considered plan of working from the very commencement. The custom of working a little here and a little there in a dilatory sort of a way, trusting to luck to "strike it" at some point, or of working first one lode and then another (when there is no annual work to be provided for), with the idea of increasing the number of chances, has frittered away many a man's means or time and left him poorer than he began. The better and more successful way is to choose the best lode and stick to that. (If the writer had learned the foregoing some years earlier than he did, he would not now in all probability be writing this article. He learned, and at some cost, "how not to do it.") By this course, so it has been proved by observation and experience, the miner of moderate means has more chances in his favor than by scattering his means and time in many places.

There is no little unsystematic and therefore unprofitable management in large mines. The most prominent instances are those where the manager in endeavoring to shirk the expense of the dead work, incurs a larger expense before he proceeds far. For instance, instead of sinking his main shaft after it passes out of the ore course and running levels to develop the ore, he goes out to the center of the ore course in the level and sinks a windlass shaft, through which he works, running levels from that and hoisting all the ore from levels and stopes below the upper level, then wheels or trams to the shaft, thus requiring two or three times as much handling as if the shaft had been sunk and the level run in a systematic way. Then before he can proceed far the water or depth of the windlass shaft will compel him to sink his main shaft and connect with the workings. This is one of several ways of making a temporary raise, losing more in the end than is gained by the makeshift.—Georgetown Courier.

### The South Pacific Coast Railroad.

A correspondent of the Alameda Independent says: I went down to Newark to gather what news I could in regard to the new railroad. I saw the leading man there, who said he had not given any news to any paper, and did not wish the affairs of the road to appear in print, but he said he would give me a few items of interest. He stated that the rails of the road were laid from Dumbarton point to Los Gatos, a distance of 30 miles, and that the road was in running order from Newark to Los Gatos, the remainder of the road to the point having to be ballasted. They have got a force of 140 Chinamen, besides the bosses, instead of the 300, which statement appeared in the columns of your last issue. On the main road from Newark to Alameda the work is being pushed forward as rapidly as possible by 100 Chinamen, who are doing the grading. They have got it graded a little over a mile from Newark, and they expect to have the rails laid in five or six weeks to Alvarado if they have no bother about the right of way. The road will run between Alvarado and the county bridge, across the creek about a quarter of a mile from the town. The road is one of the strongest ever built for a narrow-gauge. The ties are set about 20 inches apart on coarse gravel, and when the rails are laid thereon it makes a very fine road. The rails of this road are iron, and are the heaviest of any narrow-gauge road, weighing 50 pounds to the yard. The rolling stock of the road consists of four passenger coaches, two baggage, 70 platform, and ten box cars, together with hand and section cars, also three locomotives, weighing from 16 to 22 tons respectively, and all of the Baldwin build. They were made at Philadelphia, Pa., are next to the largest narrow-gauge engines that are made, and are all supplied with the Westinghouse air-brakes of the latest patent. They have had two of these locomotives running for about a year, and they have given perfect satisfaction in every respect.

#### Newark

Is destined to be the headquarters of the road, for at this place the shops are situated. The dimensions of the shops are as follows: car-shop, 54x150; machine-shop, 42x150; blacksmith-shop, 22x34, and the round-house is large enough to hold seven locomotives. The car and machine shops are just having the machinery put in, which is of the most improved pattern. The motive power for running these shops is a

large stationary engine in one corner of the machine-shop. It was built by Chas. W. Ewien & Bros., Philadelphia, for the road. The cylinder is 14 inches in diameter and 24-inch stroke; the fly-wheel is nine feet in diameter with 20-inch face, and weighs 3,000 pounds; the total weight when in working order is 8,000 pounds, and was purchased at a cost of \$1,350. These shops will be in running order in a week or ten days, when Messrs. Carter Bros., who manufacture the cars for the road, will put their workmen at work making the passenger coaches, which will be finished off inside with black walnut, primavera and tomana, the last two being brought from South America. The seats are iron, with nickel-plated arms and strips over the back, and are finely upholstered in green and crimson velvet. The cars are eight feet broad and 36 long, with capacity for holding 48 passengers. The road will be open for business on or about the first of next year.

### New Mines at the North End.

For a long time many of our mining experts have been skeptical as to the continuity of the great Comstock ore channel beyond the Sierra Nevada mine. That matter has, however, been definitely settled beyond all further doubt by the late developments on the 1150-foot level of the Utah. The ore vein on the level has been proven to be 139 feet in width of solid quartz of the best mineral-bearing character. The clay walls are heavy, and the entire ledge is as finely developed, well defined and perfect as at any point on the lode.

This proves that, although there may be now and then a partial break in the great vein, it still continues in all its strength still farther to the northwest than it has ever yet been developed. Our mining men are quick to discern and appreciate the prospective value of mines whose locations are likely to be enhanced by these discoveries, and already preparations are getting under way to start the work of development on claims that, although really valuable, have lain idle for years past, for the want of capital to work them. Among these is the North Union, which comprises the original claims of the North Utah, Utah Consolidated, North Alamosa, and the old I. O. O. F. These mines lie to the northward of the Utah, and are now consolidated under the name of the North Union. Considerable surface work has been done on each claim. The North Alamosa has a tunnel run a distance of 40 feet into the mountain side, which cuts a ledge 25 feet in width, which assays from \$15 to \$20 per ton. Another tunnel, run in the North Utah ground a distance of 100 feet, shows the vein matter to be over 100 feet in width, from which assays were obtained ranging from \$10 to \$140 per ton. We hope these companies will soon succeed in getting well to work, that we may be able to know more of the north end of the great Comstock silver cleft. Every mine on the Comstock was once a mere prospecting claim, and many of those that have since developed rich bonanzas had in the beginning no better surface prospects than these claims.—Gold Hill News.

MUD SPRINGS DISTRICT.—A new mining district has just been organized, concerning which the *Tuscarora Review* has the following: "F. L. Perkins, Tom Parker, John Walker and Henry Miller returned from the new camp, which has created some excitement in this place during the last ten days, and from them we glean the following information: The camp is located eight miles west from Simon's ranch, on the Carlin road and across the line in Eureka county. The ore on top is principally base and requires roasting, and consists of copper-glance and antimonial silver, but assays very high for surface ore. The camp was named Mud Springs, and Tom Parker elected Recorder. The Mineral Point, located by F. L. Perkins, Tom Parker and others, is 6 feet wide; the Stanwix, by John Walker and Wm. Hampson, is 24 feet wide; the Colorado, by Henry Miller, is 24 feet wide. Jack Pearson and H. McCann are there and have several good locations."

THE NEVADA TRIBUNE says negotiations are now pending by Wm. M. Lent, on account of some San Francisco capitalists, for the purchase of 4,200 feet of mining ground on Last Chance Hill, Aurora, Esmeralda county. This ground was formerly worked by the Rio Del Monte, Pond and other companies, to the depth of about 150 feet, and large quantities of bullion taken out. The successful development of the mines on Bodie hill, of which the Standard has found ore fully as rich in the 550-foot level as it had on the 200-foot level, makes the chances almost certain that the mine on Last Chance hill will prove the same. The price paid has not transpired, but we learn that it is in the neighborhood of \$100 per foot.

THE JACARILLA MINES.—A genuine excitement has begun over the Jacarilla placer mines, in New Mexico. There is no water whatever on the ground, and all operations must be carried on by dry washing, as it is called. The top ground of these diggings yields from 10 to 25 cents to the pan. The deposits are very deep and have been known for some years, but the complete absence of water has prevented their exploration. Several parties of miners from Southern Colorado have recently started for the new camp. A new process for working the gravel, by means of a machine known as Ginn's patent dry washer, has lately been tested on the ground, and is reported to have given great satisfaction.

## Where Iron and Where Steel?

"What is iron and what is steel?" we might have said in the above head, with the same application of reply. In all the tests of iron and steel, their character and constitutions, there seem to have been facts of what each specimen contains in the way of ingredients, but only in a small way has any attempt been made to discover what and how much of each ingredient is necessary for the production of certain kinds of metals. If the metallurgist will preface all his experiments with mixing the different ingredients found in steel and iron, and thus discover what is necessary to and what is not necessary or injurious to, then his further operations will be intelligible to himself and others. The questions, what is steel and what is iron? are not yet answered. It may be known what certain specimens contain by way of mineral characteristics, but while we know the character thus far, there is something else lacking to enable a uniform production, except by using such and such native-found ingredients in proportions found to produce, without being able to eliminate from or add to other ingredients differing in a small degree. To knowingly produce uniform iron and of a desired character is not yet possible. When will it be?

To know where and how far to use iron and how far steel, or both, is in the same unknown future as the production of these perfectly adapted metals. If their characteristics, as related to heat and cold, hardness and softness, strength or brittleness, were perfectly known, then the use of either or both would be readily determined. The only definition yet to be given to iron is that it is one of the metallic elements, and which exists under various circumstances and in connection with various chemical ingredients, some beneficial and some hurtful. The term steel indicates that this metallic element has lost or taken on some additional ingredients better adapting it to mechanical uses. All steel is iron, but not all iron is steel. There are no chemical ingredients in steel not found in iron, but many in iron not good in steel.

The only knowledge thus far is the slow one of experience. A bridge falls, but the reason is hard to discover. An iron or steel boiler or fire-box burns and corrodes and bulges and crystallizes, and years of time, and perhaps fortunes and lives are lost to learn that the iron or steel was not of a character to stand the labor against it. Direct tests for direct knowledge is postponed year by year, when all the expense of such tests would be regained in a short time were the tests known. It is a simple matter to construct a boiler of a part of two or three kinds of iron, two or three kinds of steel, and steel and iron variously combined, and at once apply the test. If iron is better than steel, or steel better than iron, or steel outside or inside of iron better than either alone, then let us have the knowledge.

If high or low steel or iron of different character for structures will best resist the action of a jarring burden, and the heat and cold of climate, and fierce compression or tensile strain, then let us know it. The St. Louis bridge is built to resist compression, as the spans are arches; the Brooklyn bridge is built to resist tensile strain, as the spans are suspension. It has been proved that the finer the metal the greater the resistance from compression, but it can hardly be true that the hardest steel will better resist strain than a finer quality of homogeneous iron. The Niagara bridge is of iron, and aside from a slight corrosion is in perfect condition.

These tests are the coming points to be established, and the fact that certain uses are made of certain metals of unknown characteristics, and certain results produced from such use, is no definite idea of what would result at another time or in another way. Good and bad usage, and unknown characteristics, are thus leaving the true knowledge of iron and steel in doubt. Experiments by private individuals are always attended with delay and distrust, for the feeling of conservatism and jealousy is still abroad.—*Age of Steel.*

**THE MAICHE BATTERY.**—The inventor states that when his platinized carbon battery is charged with water acidulated with 10 per cent. of sulphuric acid, a zinc surface of 25 square centimeters is sufficient for the production of electric light. The electromotive force is, however, only about two-thirds as great as Bunsen's. By charging with bichromate of potash, he makes his battery the most intense of all, for the two forces are combined, and it possesses an electromotive force superior to that of the bichromate, while furnishing a double quantity of electricity. His battery has, therefore, the advantage of either being charged with simple acidulated water, or with the addition of the bichromate, which makes it the most powerful known electro-generator.

**PRICES PAID FOR DIGGING COAL.**—The *Coal Trade Journal* says: Wilkinsburg, Pa., two and a half cents per bushel. Saltsburg, Pa., two and three-quarters cents per bushel. Saw Mill Run, Pa., 48 cents per ton. Vienna, O., 50 cents a ton, cutting three feet of coal, and move half as much slate free. Neshannock, Pa., one place reported as working at \$1.25 per day. Sewickley, Pa., two and a quarter cents per bushel.

## USEFUL INFORMATION.

**CONVERTING COTTON INTO WOOL AND LINEN.** The system of parchmenting paper is now applied to cotton, and according to the *Age of Steel*, promises a very important result. 1. Parchmented cotton as a substitute for wool. The raw cotton, well cleaned, is left for 24 hours in a solution of one part concentrated sulphuric acid, one part of sulphate of glycerine, and three parts water, at a temperature of 63½° F. It is then wrung between glass rollers until the test paper goes no longer red. After drying the fibers will be found to have acquired most of the qualities of sheep's wool, and for using this cotton for spinning, weaving, or dyeing, it has only to be wrapped (beaten into?) in felt. When fabrics are made exclusively with the transformed material, and finally have been animalized in the usual way by milk, ammonia, oil, and lime, the fabric cannot be distinguished from genuine woolen goods, except by the smell given off in burning them, since the lanified cotton smells just like the natural one. The super properties acquired by the cotton through this process justify the expectation that it will supersede all the ingredients hitherto used for producing half-woolen goods. 2. Cotton parchment as a substitute for linen. Cotton yarns which have been steeped for 24 hours in a mixture of two parts concentrated sulphuric acid, and three parts water at 63½° F., is then pressed and dried as above, and will not only have acquired every property of linen yarn, but it is also stronger and less corruptible than the latter. The difference in price, especially in fine numbers such as used for cambrics, being very considerable, the process would also prove commercially successful in this branch of industry.

**MANUFACTURE OF PORTLAND CEMENT.**—An English exchange says that an important improvement in the manufacture of portland cement has been patented by Messrs. White, of Swancombe, by which a better quality of material is obtained and the cost of manufacture is considerably reduced. For this purpose they take chalk and clay in the natural state in which they are found, and without the admixture of water they obtain an intimate mixture of these materials by placing them together into a hopper, from which they pass to a series of pairs of crushing rollers. The materials as they leave the hopper have first to pass through a pair of pairs of fluted crushing rollers, from which they pass to other pairs of plain rollers, placed closer and closer together, and running at increased surface speeds. By this means the materials are reduced to a thin sheet, the chalk within which is in a thoroughly disintegrated state and mixed with the clay. After the materials have thus been crushed and mixed together by means of rollers they may be molded into bricks to be burnt in any ordinary manner, no fuel being mixed up with the materials of which the cement is composed.

**VALUE OF THE EUCALYPTUS.**—We learn from the *Meteorological Magazine* that, at the Easter reunion at the Sorbonne, some information was given by Dr. de Pietra Santra, a delegate from the Climatological Society of Algiers, as to the results of an investigation made in Algeria to ascertain the importance and value of the *Eucalyptus globulus* in relation to public health. It appears that reports were received from 50 localities where the aggregate number of blue gum trees is nearly 1,000,000, and from these reports the following conclusions have been drawn: 1. It is incontestably proved that the eucalyptus possesses sanitary influence; for 2, wherever it has been cultivated intermittent fever has considerably decreased both in intensity and in frequency; and 3, marshy and uncultivated lands have thus been rendered healthy and quite transformed. Similar results have been obtained in Corsica, where it is computed that in the present year there will be upwards of 600,000 plants of eucalyptus in full growth.

**WHAT A MAN CARRIES UP-STAIRS.**—In the course of an article on elevators the *Polytechnic Review* remarks: Few consider that stair-climbing necessitates an actual lifting of the whole weight through a vertical distance equal to the height of the stairs. A man weighing 160 pounds in walking up a flight of 16 steps, each with an eight-inch rise (corresponding to a 12-foot ceiling), in a time of 20 seconds has lifted 1,920 pounds a foot high in that time—nearly a ton weight. To climb to the top of a four-story building—say 52 feet vertically to the fourth floor—in 90 seconds represents the lifting of 8,300 pounds a foot high in that time. Reduced to minute foot-pounds, this equals 5,533 pounds lifted a foot high in a minute, or one-sixth horse-power.

**ARTIFICIAL FUEL.**—An improved fuel has been proposed, consisting of peat dust, 125 parts; slimy deposits of rivers, 10 parts; anthracite dust, 1,000 parts; schist oil waste, 100 parts; and dry coal slack, 120 parts. Another improved fuel is suggested by Mr. Mallee, consisting of pulverized charcoal waste, 80 parts, with 20 parts of pulverized charcoal, which are mixed together, and he then adds five parts of nitric acid, two parts of nitrate of potash, and five parts of gum arabic. The product is considered to be specially adapted for cooking stoves, as it causes neither smoke nor smell. It can be lighted with a match like touchwood, and covered with the other portions of the fuel the combustion continues.

## Notes for Metal Workers.

From the pages of a recent issue of the *American Jeweler and Silversmith* we collect the following hints of practice:

**Silver alloys.**—No. 1. Silver, 11 ounces, two pennyweights; copper, 18 pennyweights. No. 2. Silver, one ounce; copper, one pennyweight, 12 grains. No. 3. Silver, one ounce; copper, five pennyweights. A solder for the above is as follows: Silver, 16 pennyweights; copper, 12 grains; pin-brass three pennyweights, 12 grains.

**Silver solder, for enameling.**—Silver, 14 pennyweights; copper, eight pennyweights.

**Quicksilver solder.**—Silver, one ounce; pin-brass, 10 pennyweights; bar tin, two pennyweights.

**Common silver, for chains.**—Silver, six ounces; copper, four ounces.

A bright gold tinge may be given to silver by steeping for a suitable length of time in a weak solution of sulphuric acid water, strongly impregnated with iron rust.

**Polishing tortoiseshell and ivory.**—Putty powder (oxide of tin) will put a beautiful polish on ivory, and would possibly do for tortoiseshell. Apply the putty powder on a piece of flannel with water or methylated spirits and elbow grease, and finish off with dry powder.

As nickeling is replacing silvering in certain cases, so there are cases where nickeling may be itself replaced for many articles of small value. The manipulation is very simple. Coarse, rasped, or granulated zinc is boiled for some time in a mixture of three parts, by weight, of sal ammoniac and 10 of water. The object immersed and stirred up with a zinc rod. The deposit is silvery bright, and resists mechanical action as well as a coating of nickel. This process can be recommended for goods that are meant for second coating of some other metal, since any other is easily deposited upon zinc.

A gold lac, remarkable for its great hardness and beautiful color, on being analyzed by Dr. R. Kayser, Nuremberg, gave as its constituents picric acid and boric acid. Thereupon a clear shellac solution was mixed with picric acid and half per cent. of crystallized boric acid, each being previously dissolved in alcohol, and the resulting lac possessed all the advantages of the former one.

**TO REMOVE RUST.**—To extract rust from steel, immerse the article to be cleaned in a solution of one-half ounce cyanide of potassium to a wine glass full of water until the rust and dirt disappear. Then clean by means of a tooth brush with a paste composed of cyanide of potassium, castile soap, whitening, and water.

**BELGIAN METAL.**—Belgian anti-friction metal is composed of copper 20, tin four, antimony one-half, lead one-fourth parts. Mix all the other ingredients before adding the copper.

## GOOD HEALTH.

## Care of the Eyes.

Do not read or write before sun-up or after sun-down. Let the light fall upon the page from behind. Never read while lying down. Those whose eyes are weak should never read or sew by candle or gas light, nor by twilight. Suffer nothing to be applied to them unless by the special advice of an experienced physician. If the lids stick together in the morning on waking up, moisten them with the saliva, it softens and dissolves the matter sooner than any liquid known. The best and safest treatment for most affections of the eyes is rest, especially if weak or inflamed, rest from reading, writing or sewing, from every use of them which requires close observation, spending a large portion of the time out of doors, as then, large objects are mostly viewed. Persevere in this for weeks and months if necessary, and if not then relieved, consult a physician.

Avoid reading on horseback or in rail cars or any wheeled vehicle while in motion. Many persons will find that in reading before breakfast an effort is required to keep the sight clear, but after breakfast no such difficulty is experienced; the reason is, the eye under such circumstances is more or less inflamed, that is, has too much blood about it, but nature calls that excess of blood away to the stomach after eating, to enable it to perform its work more thoroughly. Therefore, persons with weak eyes should not read or write or do fine sewing on an empty stomach. Our preceptor, Professor Dudley, who is among the very first of living surgeons, used often say, "Young gentleman, never let anything touch the eye or ear stronger than lukewarm water." We have but one sight to lose, its preservation merits all our care, and it is unwise to tamper with, or experiment upon an organ so indispensable to our comfort, happiness and usefulness.—*Hall's Journal.*

**A SMOKER'S DISEASE.**—M. Mauriac, Surgeon of the Hospital du Midi, has just added another to the special diseases of smokers. He has described, under the title of *plaque des fumeurs*, a morbid change of mucous membrane of the tongue and mouth, a special psoriasis. This lesion may degenerate into epithelioma; and according to M. Mauriac, cancer of the lips and tongue has often no other origin than this. Both are common among men, and very rare, as might be supposed, among women.

**WHAT IS FEVER?**—Dr. H. F. A. Goodridge, in a very interesting sketch in the *British Medical Journal*, of fever pathology, sums up our positive knowledge as follows: The characteristic elevation of temperature of the body in fever is mainly due to increased production of heat. Besides the increased production of heat there is a disorder of nutrition, an abnormal disintegration of the body, and particularly of the muscular tissue, evinced, on the one hand, by increased excretion of urea and potash salts, of carbonic acid, and perhaps also by water; and on the other by progressive loss of body weight. The increased production of heat occurring at a time when a principal source of normal heat production, viz.: the food ingested, is all but completely cut off, must have its origin in the abnormal disintegration of tissue. The converse may also hold good to a greater or less extent, there being thus action and re-action. However probable may be the hypothesis of the intervention of the nervous system, the connecting link between the entrance into the organism of the fever excitant, the pyrogenic matter (be this *contagium febrile*, or what it may be,) and the onset of the characteristic phenomena, have not yet been demonstrated. In short, the proximate cause of fever remains undetermined.

**DEATH FROM POISON OAK.**—A young man named George Kelley died yesterday under peculiar circumstances. On Sunday last he drove a party out to Alum Rock, and while there it is said drank two or three glasses of beer and wandered around for some time at the Rock. The next day he complained of soreness of the face, and Mrs. Sikes, the wife of the hackman, in whose family he was employed as hostler gave him some ammonia to apply upon it. Becoming worse physicians were called, though he soon became insensible and continued to fail until yesterday, when death ensued. Deceased was about eighteen years old, and bore a good reputation. The funeral will take place from the residence of his father, James Kelley, on the Alameda, at 2 P. M. to-day. The case is spoken of by physicians as an extraordinary one, poison oak seldom causing more than a few days' inconvenience. However, some are more susceptible to its influence than others. It is thought Kelley's system was out of order else the poison would not have resulted fatally.—*San Jose Mercury.*

**MOTHERS, STUDY HYGIENE.**—Writes Mrs. Diaz in her charming little volume of "A Domestic Problem": "Will not you who know the inevitable influence of the mother upon her children—will you see to it that some portion of the time devoted to her education is spent in preparing for her life-work? Suppose the young women of 30 years ago had been thoroughly instructed in hygienic laws, would not the effects of such instruction be perceptible in our present health rates and death rates? Let us begin now to affect the health rates and death rates of 30 years hence, and it will do no harm to instruct young men in these matters. Even now there comes to me a report from the State Board of Health, in which it is shown, by facts and figures, how our death rates are affected by ignorance—ignorance as exhibited in the locating, building and ventilating of dwelling-houses, drainage, situation of wells, planting of trees, choice of food and cooking of the same, as well as the management of children. Can any subjects compare in importance with these? For humanity's sake, let our young people take time enough from their Latin dictionaries to learn how to keep themselves alive."

**BURNING KITCHEN REFUSE.**—In the city where the dweller is dependent upon the dilatory swill carrier to come for the refuse, it is better to burn the refuse in the kitchen stove or range than to allow it to lie around the area a source of pests and pestilence. We have for some time practiced burning, and find much truth in the following from the *Sanitarian*: "Among the internal rules and regulations of our kitchen, one of the most preceptory is the absolute prohibition of *swill tubs* and *swill gath-ers*, and instead thereof, *daily burning* all peashucks, corn-cobs, potato-peelings, fruit-parings and the like, together with all greasy table and kitchen scraps, which render the mixture readily combustible. The odors are all carried off with the smoke up the chimney, and with ordinary care for a good fire in the range, and daily combustion—so as never to have large accumulations—ashes only are the convenient result."

**DISEASE AMONG POTTERS.**—The statement is made that on incinerating the lungs of a potter, it was found that there was present in the ashes left, the great amount of 45% of silica, 18% of alumina and 5% of the oxide of iron, thus showing to what an enormous extent finely divided clay is being constantly breathed by potters, a circumstance causing premature death. It is also stated that in Wales and England the number of persons engaged in the manufacture of pottery is about 45,000. Among the males the census shows the mortality to have been no less than 38% higher than the average death rate for the males of the whole community above the age of 15, this increase relating principally to those in the very prime of life.

**LAUGHTER.**—A good laugh occasionally is better than a whole apothecary's shop of medicine. It is an act of wisdom; it shakes the cobwebs out of a man's brains and hypochondria from his ribs far more effectually than either champagne or blue pills.

# MINING SCIENTIFIC PRESS

W. B. EWER..... SENIOR EDITOR.

DEWEY & CO., Publishers,  
A. T. DEWEY, GEO. H. STRONG,  
W. B. EWER, JNO. L. BOONE.

Office, No. 224 Sansome Street, S. E. Corner of California Street, San Francisco.

## Subscription and Advertising Rates:

ADVERTISING RATES.	1 week.	1 month.	3 mos.	12 mos.
Per line.....	.25	.80	\$ 2.00	\$ 5.00
Half inch (1 square).	\$1.00	\$3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Four insertions are rated in a month.  
SUBSCRIPTION IN ADVANCE—Postage paid—one year, \$4; six months, \$2.25; three months, \$1.25. Remittances by registered letters or P. O. orders at our risk.

WRITE FOR THE MINING AND SCIENTIFIC PRESS. We invite not only professional men, but practical miners and mechanics to contribute to our columns. All communications will be kindly treated. Authors, as well as readers, will be benefited by corresponding.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, July 21, 1877.

## TABLE OF CONTENTS.

GENERAL EDITORIALS.—A Hydraulic Gravel Elevator, 33. The Week: Prospecting; Primitive Smelting Operations; Items of Interest from the Mines; Sanitary Cellars, 43. Temperature and Organic Remains in Ponds and Echo Lakes; Manufacture of Lamps and Lanterns; An Indian Fishery; The Yellow Jacket Mine; The Coming Exhibition, 41. National Immigration Bureau, 44.

ILLUSTRATIONS.—Cranston's Hydraulic Elevator for Gravel Mining, 33. Indians Fishing in Walker River; Bosch's Hydraulic Mining Lamp, 41.

CORRESPONDENCE.—El Dorado Mines; Mining in Amador Co., 34.

MECHANICAL PROGRESS.—Our Mechanical Triumphs: A Problem for Inventors; A Substitute for Brass; Loss From Oxidation; The Cost of Lubrication; Iron in France, 35.

SCIENTIFIC PROGRESS.—Questions for California Botanists; Russians and Turks; Comets in the Spectroscope; Relics in a New York Cave; Microseismic Observations; A New Expedition; A School for Millers, 35.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 33.

MINING SUMMARY.—From the Various Counties of California, Nevada, Arizona, Colorado, Idaho, Oregon, and Utah, pages 37, 42.

THE ENGINEER.—Registering the Gauge of Railways; What has been done in the Mississippi; A Field for American enterprise; Suspension Bridges Invented 1,000 Years Ago, 38.

USEFUL INFORMATION.—Converting Cotton into Wool and Linen; Manufacture of Portland Cement; Value of the Eucliptus; What a Man Carries; Upstairs; Artificial Fuel; Notes for Metal Workers; To Remove Rust; Belgian Metal, 39.

GOOD HEALTH.—Care of the Eyes; A Smokers' Disease; What is Fever; Death from Poison Oak; Mothers, Study Hygiene; Burning Kitchen Refuse; Disease Among Pottery; Laughter, 39.

GENERAL NEWS ITEMS on page 44 and other pages.

MISCELLANEOUS.—Tybo District; Studying Mining; Silver King Products; Petroleum Discoveries, 34. Systematic Mining; The South Pacific Coast Railroad; New Mines at the North End; Mud Springs District; The Jacarilla Mines, 38. Where Iron and Where Steel; The Maiche Battery; Prices Paid for Digging Coal, 39; Jablockhoff's Electric Candle, 42.

## NEW ADVERTISEMENTS.

National Drill and Compressor Co., 97 Liberty St., New York; Hyatt's Life Balsam, 246 Grand St., N. Y.; John Wiley & Sons, 15 Astor Place, N. Y.; John L. Boone, S. F.; Corporation Notices—South Comstock O. and S. Mining Co.; Nevada Land and Mining Co. Mariposa Land and Mining Co.

## The Week.

We give in another column the statement of the bonanza mines for the first half of the fiscal year, the publication of which is the principal feature in connection with mining operations. The bullion shipment for the present month is not included in the statement. The total expense of ore production, milling, etc., is under \$30 per ton. We are without our usual summary from the Comstock this week, owing to the delay on the railroad, caused by the fire at Cisco. News from the scene of the Indian war in Idaho is more favorable than of late, Joseph being represented as in retreat with his band before the troops. It is expected that the chief will shortly surrender. The railroad strike trouble in West Virginia has assumed somewhat unusual dimensions. The President has issued a proclamation calling on all good citizens not to take part in the unlawful proceedings. U. S. troops have been sent to preserve peace, but the "strikers" seem desperate, and there will be further trouble before it is all over. The men claim that the wages offered are not sufficient to support themselves and families.

COPPER is selling in Liverpool as follows: Good ordinary brands of bars, £68 15s to £69; special brands, £69 10s to £70; ore, 13s 6d to 13s 9d per unit.

## Prospecting.

The city is full of idle people looking for work; and other cities and towns on the coast are similarly afflicted. Times are hard and these men profess to be willing to take hold of anything they can find to do. We can suggest to some of these idle persons, without families, that there is a splendid field for their exertions in the interior mining counties, for sober men, in the line of prospecting. It does not need an expert to prospect, as some suppose, although it requires experience to properly work a mine. If a man has some experience, so much the better, although some miners believe that a new hand has better luck in finding claims than the old hands. "Greenhorn's luck" is proverbial among the miners, and a good many instances of the kind have occurred of late.

It does not require much money to prospect. Rough clothes and plain food are not expensive, and men will spend more of their savings in a month looking for work than they will in three months in the mountains while prospecting. They must have food while idle as well as while at work. It looks, moreover, as affairs are in this city at present, as if they had as good a chance to find a claim in the mines as to find a situation in towns. At all events it is worth trying, and there is a chance to make as much in six months as they might here in as many years.

There are many districts where there are good chances for prospectors. In Nevada county there have been several strikes of late, and concerning prospecting there the Nevada Gazette says: "The success which has been met with in this district by those who have been engaged in prospecting during the past two years ought to encourage others who have the time or means, to go to work. It is true that many have worked long and discovered nothing. Probably all who hunt for gold-bearing leads will not find them, but the proportion of lucky men engaged in the business is as great as in any occupation. There have been several valuable mines opened here during the past 18 months. Any one of them would pay for all the labor that has been expended in the district during that time in prospecting, at regular rates of wages. That there are many other paying ledges undiscovered is past dispute. The frequent discoveries recently made prove it. There is a perfect network of veins traversing the whole section. Many of them, if worked upon in the right place, will be found to contain rich ore. All ledges have pay shutters if they can be found. A failure to strike it in one place will not prove that good rock does not exist in the same lead at another place. Perseverance will reward the prospector in the end. Work was about to be suspended in several of the discoveries a few days before rich rock was found. All this section needs is the opening of a few more paying mines to make everything prosperous. The only way to have them opened is to diligently search for them. Business men should lend every assistance in their power to the industrious prospector. Their success means success for business houses. It is better to trust a hard working man who is penniless than the man about town who has no occupation, but it is not always done. The man who is willing to spend his time and labor in search of gold, ought at least to be supplied with what he wants to eat by those who will, if he succeeds, be indirectly benefited by his discoveries. Prospecting companies consisting of half a dozen persons can be formed and kept up with but little expense to each individual composing them, with a good prospect of reaping a rich reward thereby. Idle men, if any are here, ought to be kept at work when their labor will, after awhile, bring about what all so much desire."

## Primitive Smelting Operations.

The trite old saying about necessity being the maternal parent of those things which the Patent Office was created to take charge of, is nowhere more frequently verified than in the mining regions. There men are thrown on their own resources to a greater extent than elsewhere, and have to make things answer more purposes than they were intended for. They have to improvise all sorts of contrivances out of rude materials, make metal answer for wood, and wood for metal, and exercise their ingenuity in many ways. A glance through any of the books treating of mines and mining appliances will show numerous useful inventions which were the results of these conditions.

In metallurgical operations, where capital is required, the miners try all sorts of dodges to get the money out of the ore in a small way. One of the latest of which we have heard is being applied at the Mineral King mines, in Tulare county. The miners facetiously term it the "Fryer process," because a frying pan is the principal appliance. It seems to succeed better than that from which it takes its name. A correspondent of the Visalia Delta describes in detail the operation: First, a common blacksmith forge is obtained, and second, a common iron frying pan is luted on the inside an inch or more thick with clay, and then placed about three inches below the nozzle of the bellows; around said frying pan are laid common rock to the height of eight or ten inches; the hollow, or chimney, is then filled with charcoal, fire being placed at the bottom, the wind blast turned on, and the smelting commences by lay-

ing on the top of coal the pulverized ores. In this way much of the lead and some of the silver is carried off by volatilization. Notwithstanding this, however, the fact remains that the ores of this district are easily reduced to rich merchantable bullion, and several bars of metal, weighing about a pound each, composed of about 70% of pure silver, have been made here from the following ores: White Chief, Chihuahua, Dolly Varden, and Grecian Bend, each of them with a little iron ore to neutralize the sulphur, and a little lime rock to thin the slag, (both of which ingredients are found in great abundance in the mines). The ore was easily reduced to a rich marketable bullion, and were it not for the fact that this process can be carried on for a short time only, owing to the molten slag having no place through which it can be drawn off, but soon chills above and around the blast, we, as miners, would soon be shipping bullion.

## Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective Superintendents on file at the offices in this city:

The water in the Savage is 102 feet below the 1900-foot level.

In the Justice mine, the general run of the ground in face of east drift 1150-foot level is of a much softer nature than any heretofore discovered on this level, being no less than pure birdseye porphyry. Upraise on 1000-foot level continues to develop the same uniform grade ore it has passed through for a height of forty feet; the stopes from each end of the upraise are looking well.

The Winfield mill is running steadily on Ophir ore.

In the Ophir the stopes on the 1400 and 1500-foot levels still continue to look and yield well. The old fillings on the 1500-foot level are giving some ore which will pay \$30 per ton. Both inclines are progressing rapidly.

At the Golden Chariot (Idaho), they have started sinking the bottom of the shaft.

There is in the last few days an increase of quartz in the face of the south winze of the Con. Imperial, which gives low assays. The formation in face of cross-cut in centre of mine is looking well. The mine is very much hotter since the hot weather set in; it has increased about 4 degrees in the last week.

Chollar turned out 679 tons of ore last week, averaging \$23 per ton.

The Eureka Consolidated mine is looking splendid throughout all the different workings where ore is in sight. The 5th level ore body seems to increase in extent, showing no diminution notwithstanding the large quantities of ore extracted. The 6th level ore body looks first-rate. The furnaces are turning out from twelve to thirteen bars each of bullion daily.

The 1900-foot station of the Hale & Norcross has been enlarged and entirely retimbered.

The Superintendent of "Solid Silver" writes under great excitement that the ledge at the bottom of the winze shows the finest prospect on the Comstock.

At the Eureka (Grass Valley), which has closed down permanently, they are burning the blanket tables, riffle boxes and floors to get the gold out. A gold bar weighing 612 ounces was shipped last week.

In level No. 3, south of the Empire (Grass Valley), the ledge is very small and the ground hard.

In the Overman the drift being run north on 1400-level has been extended 28 feet during the week; a distance of 33 feet to run yet before a connection will be made with the Belcher south drift on 1600-foot level. When this connection is completed it will furnish a good circulation of air, and greatly facilitate the work.

They have 200 tons of good ore on the dumps of the Coso Con.

They have struck the ledge in cross-cut on the fifth level of the Empire (Idaho), running 40 feet north of the furthest workings on the sixth level. It is very rich in free gold.

The ore from the Andes is averaging about \$20 per ton.

The new Grand Prize mill has been started up.

THE Bank of California statement for July 1st, as required by law, has been published: The gross assets are given at \$9,583,522, of which \$5,000,000 is due to stockholders for capital stock paid in, \$4,547,705 to depositors, \$19,053 to sundry Eastern banks and bankers, and \$26,763 to profit and loss account. The cash and bullion assets on the 1st of January were \$2,878,792, and on July 1st \$2,116,649. The comparison shows a loss of \$762,000, though as compared with July 1st, 1876, the loss is only \$123,000. The line of deposits is \$1,390,850 less than it was six months ago. The assets of the bank are regarded as being in a more healthful condition than they have been at any time in over two years.

FOUR Chinamen, who have been working in the mines at Smartsville, passed through Wheatland last Wednesday with \$18,000 in their possession as the result of their labors. They brought with them two shotguns and three revolvers as a protection against robbery.

AUSTIN has got a mining excitement. Some ore assaying \$500 to the ton was lately discovered near Silver Creek, and a grand rush is the result.

## Sanitary Cellars.

The fact is fast coming to be realized that humanity is responsible for much of its own sickness and premature death, and it is no longer necessary to offer an apology for presenting to public consideration a subject in which, more than any other, the general public is vitally interested. Proper foundation for human habitations is one of the greatest needs of the age. It is not enough that we build our houses on healthful sites and where we have pure air and water; we must make provisions for preventing these sites from becoming foul, as every unprotected house site invariably must. The house we live in should be so carefully constructed in all its parts that the health of the occupants can only be assailed from outside causes and cannot be endangered from any imperfect interior construction in ventilation, heating, draining, etc.

Although in California, from the nature of the climate, cellars are not considered as essential as in the Eastern States and most of the houses here are constructed without them, it is nevertheless the fact that under such houses there is a great deal of dampness, producing miasmatic exhalations. It is a well established fact that the principal cause of fever is a humid miasmatic state of the atmosphere, produced by the presence of an excess of moisture in the ground, from which poisonous exhalations constantly arise, and carrying into the system of those who inhale it a virus, which, if not sufficiently intense to produce fever, has such a disturbing effect on the functions of some organs as to weaken the general system.

In many large cities fine residences are made unhealthy by the escape from leaky sewers. In this city, where so many buildings are constructed on made ground, sufficient attention has not been paid to this important matter. The usual cemented cellar is little protection, the cement concrete having had from 10 to 20% of its bulk composed of water when laid. As it dries out, the space occupied by the water is gradually occupied by air until the entire concrete is porous and offers little resistance to the passage of air or gases. Impossible as it may seem, it is an easily demonstrated fact that through even the heat of concrete when dry, air can be blown readily by the ordinary power of the lungs. Water is a ready solvent and absorbent of most all dead matter, and in connection with heat soon putrefies animal and vegetable matter. As a solvent it distributes it through the soil which becomes saturated in time with the foul accumulations of fetid matter. Many epidemics have been solely traced to this saturation of the soil on which the city is built. The saturation from privies in the yards is a very serious matter. Pettenkoffer in his investigations found that in removing the contents of privy vaults about 1-10th of the refuse matter was carried away, and 9-10ths was absorbed by the ground.

The nature of the soil on which a building stands has more or less to do with the health of the residents. The connection of fever and ague with soil and moisture and with the obstructed decomposition of vegetable matter in saturated ground or in moist air are almost universally recognized. Many houses in cities are built in a hole in the rock 10 feet or more below the level of the street or upon ground filled in to meet the street grades. In the first the surface water naturally flows down between the walls of the houses and saturates the walls and the cellar bottom and become a producer of malaria. In the other the vegetable matter buried up is constantly sending up gases as fast as they are evolved by the vegetable decomposition, so that no cellar is in any fair sense healthy until made absolutely impervious to the penetration of moisture and gas through the bottoms and side-walls. As an evidence of the unhealthfulness of ordinary cellars, several large cities have laws restricting their use as places of abode. In this city and others, in the business portions, where space is very valuable, modern architects have seen fit to construct the lower stories several feet below the street, and in such places people spend half their lives. If proper precautions to keep out the dampness are not taken, such buildings cannot by any means be healthy, and are as injurious as poorly constructed cellars in dwelling houses. Mr. T. New, of 32 John street, New York, has a method of constructing cellars which is superior to those commonly in vogue, and which secures them against water and dampness, and those interested in the question will do well to correspond with him. This cellar is constructed with a water and air-tight lining of alternate layers of felt (saturated with bitumen) and asphaltic cement, which is protected by artificial stone and other materials. We shall probably describe this improvement more in detail, with the aid of an engraving, shortly.

THE Nevada Bank, of San Francisco, has the largest paid up capital of any bank in the United States. The capital stock is owned by five persons, Jas. C. Flood, Wm. S. O'Brien, Jas. G. Fair and John W. Mackay owning 23,750 shares each. These lots are valued at \$2,375,000 each. Louis McLane owns 5,000 shares, valued at \$500,000, making the total capital \$10,000,000. The reserve fund is \$2,000,000. Most, if not all, of this money, came from the "bonanza mines" on the Comstock—the Consolidated Virginia and California.

## Temperature and Organic Remains in Tahoe and Echo Lakes.

At the regular meeting of the California Academy of Sciences held on Monday evening last, Dr. James Blake, of Napa county, read the following paper "On the Temperature and Organic Remains in Lake Tahoe and Echo lake."

During my stay in the vicinity of these mountain lakes, I took the opportunity of ascertaining their temperature at different depths, by means of a Cassell's deep sea thermometer and also of using the two net and dredge in both lakes. Owing to the overturning of the water in which I was descending from the mountains, I unfortunately lost the note book containing the record of my observations, so that I can now only relate from memory the principal facts observed. As regards the temperature, I found the surface water of Lake Tahoe at the temperature of 62°. This was in the middle of July, at a time when the temperature of the air was ranging from 36° to 76°. Near the south shore the temperature of the water would rise 4° or 5° during the hotter part of the day, but would be again 62° at sunrise, although the air was 36°. This higher temperature was found only in the shallower water at the south end of the lake, where the depth for half a mile from the shore gradually increases to about 160 feet. Beyond the edge of this bank the depth suddenly increases so that the next sounding, at not more than 300 yards from the edge of the bank, gave a depth of 560 feet, with a bottom temperature of 39.7°, the temperature at the surface being 62°. Owing to the sounding machine getting out of order, I was unable to ascertain the temperature at greater depths, but as 39.4° is the temperature at which water attains its greatest density, it is probable that no lower temperature would be found even at the deepest part of the lake.

In Echo lake, which is at an elevation of 1,000 feet above Lake Tahoe, and about 150 feet deep in the deepest part, the temperature of the water at the bottom at a depth of 145 feet was 41.3°. This was in the month of July, at a time when snow was still found in spots at a few feet from the shores of the lake. The surface temperature was from 56° to 62°, the temperature of air ranging from 30° to 70°. At the time the soundings were taken the temperature of the water at the surface was 62°, of the air 68°.

In using the tow net I found, both in Lake Tahoe and in Echo lake, the surface of the water swarming with cirripeds, although the number in Lake Tahoe far exceeded that in Echo lake. The net when towed near the surface only contained the perfect insect, but at a depth of 20 feet from the surface nothing but the ova in different phases of development were obtained, and not a perfect insect. This fact probably explains the absence of these insects in running water, as it would seem that the nva only meet with the conditions favorable for their development in water where they can remain at a depth from the surface, a condition that cannot be secured in running water. Owing to an accident I met with shortly after my return from the mountains, the objects collected from the dredge were not examined and have since been mislaid.

At the depth of 560 feet I found the bottom of Lake Tahoe covered with the same deposit of disintegrated granite which is found so extensively at the south end of the valley and at other points on the shores of the lake. The larger part of the bed of the lake is formed probably of the same material, and not, as in Echo lakes, of a hard, rocky bottom, although at many points near the shore the bottom can be seen to be formed by boulders. There is, however, this difference between the two lakes, that whilst the basins of Echo lakes were evidently ground out by ice action, Lake Tahoe for ages before the ice epoch had been the receptacle of the washings from the mountain masses that surround it, and during the ice period I believe glaciers had little to do in modifying it. Even as regards Emerald bay and Fallen Leaf lake, I cannot agree with Prof. LeConte in considering them as formed by ice action. There can be no doubt but that the shores of these lakes are formed to a great extent of moraine matter and also the bars that separate them from the main lake, but that ice should scoop out these basins at a depth of from 1,000 to 2,000 feet beneath the surface of the water, I think very improbable. I believe both Fallen Leaf lake and Emerald bay to be deep mountain fissures, modified by ice action. I would also here correct another mistake into which Prof. LeConte seems to have fallen, by regarding these smaller lakes as the result of ice action. He observes that the scooping action of the ice is in these lakes at the upper end, whilst the glacial deposits are at the lower end. In Echo lake, which has undoubtedly been scooped out by ice action, the upper end of the lake is quite shallow and slopes off very gradually, with a perfectly smooth bottom, the greatest depth in the lake being reached at two-thirds of the distance from the upper end.

The Martin White company has received its first shipment of fine bullion, amounting to \$10,000. The run of the cupel furnace for ten days yielded \$15,000.

The Dayton mine has \$140,000 worth of machinery, etc., and at the last quotations of the stock the mine was only valued at \$25,000.

## Manufacture of Lamps and Lanterns.

Among the manufacturing industries of this city which ministers to the comfort and convenience of the people, and cheapens the price of articles of necessity, is that of lamp and lantern making. At first sight it would seem that this industry must be limited in extent and the products of few varieties. This is by no means the case, however, as there are so many uses to which these articles are put, and so many styles needed to suit the demand for different purposes, that their manufacture has to be carried on by skilled workmen and on a large scale. The only large manufactory in this line in the city is that of Emile Boesch, No. 569 Mission street, and from this place are supplied the numberless kinds of lamps, lanterns, reflectors, etc., used by the wholesale and retail trade.

Mr. Boesch is himself a practical workman and understands the business in all its details, having been in it here for some nine years, besides being previously engaged in it in France. When he started business first in this city he began on a small scale, but has gradually extended his operations until now he occupies a commodious factory, employing improved machinery for saving labor and time. He has a fine steam engine, which enables him to do work promptly and at prices which only a large house, having every facility, can afford. Mr.

These works are also supplied with machinery for metal spinning. This department has lately been extended so as to make copper halls, bar room boilers, shower hats, etc., to order. Mr. Boesch now does all his own work in this line, and does it also for the trade to order. At this factory a great variety of other styles of lamps are made. The sign lamps made are peculiar and in extensive use. They are turned out in a variety of forms for various purposes. There are also a variety of forms of patent silvered corrugated glass reflectors for lighting up show windows, halls, etc. In fact, every possible style of lamp and lantern as made for hotels, residences, churches, ships, railroads, cars, mills, etc. Mr. Boesch has created the business here, and has succeeded in stopping the importation of this class of articles, showing a most successful home industry.

## An Indian Fishery.

Our illustration shows the style of fishing practiced some years ago by the Piute Indians in Nevada. A tourist of a score of years ago gives the following account: As we rounded a little knoll we discovered the entire rancheria of Indians in a bend of the river making preparations to catch fish, and we at once rode down to witness the sport, which proved to be a novel scene. Stretching nearly across the stream was a rocky bar, over which a very little of the water rippled, while the main body of it made

INDIANS FISHING IN WALKER RIVER.

Boesch has, since he was established in business here, perfected nine different patents on articles in his line, besides introducing many minor improvements.

One of the most important of these improvements designed by Mr. Boesch is that relating to the lanterns used in hydraulic mining operations. Owing to the fact that the miners are compelled to take advantage of every inch of water that flows, they work night and day during the mining season. At night, of course, they must have light for their operations. The old fashioned way was to have brush fires, which, however, have long been superseded by lamps. Ordinary lamps, no matter how large or well made, did not fill the requirements, and Mr. Boesch has succeeded in perfected one now

a sudden bend around, keeping close to the opposite bank. Just above the bar was a deep eddy, and above this the stream was broad, shallow and rapid, and skirted on each side with a thick growth of low, withy willow. Here of this willow the Indians made a drag about two feet in diameter and in length sufficient to reach across the stream. On the bar they had built a slight wall of the small rock in the form of a half circle, at the lower side of which was a willow fish-trap, the water being only a few inches or a foot deep inside the circle. When all was ready they swung the drag out across the stream and let it sweep down to the eddy when they all gathered in above it and keeping it near the bottom swept it through to the shallow bar, bringing the two ends to join the wall, when they had all the fish "corralled" within the circle, then pressing their knees upon the drag to keep it firmly to the bottom, they commenced the exciting sport of pulling out the fish, which as a matter of course tried to find a place of egress at the upper side. The suckers, which constituted a greater portion of the fish, were easily taken in this way; but the trout, more wily, flipped lightly over the drag and away upstream again. The scene they presented as they knelt over the drag, men and squaws, old and young mixed up indiscriminately, and carried the fish to their mouths as they caught them to hit their heads, frequently holding them in their teeth for some minutes, the poor suckers twisting themselves spasmodically in their death agonies, was truly ludicrous and amusing. A few of the fish entered the trap, and at the last, one big fellow seemed to have got an idea of the danger that awaited him on either hand, and flipped about in the center of the pool, foiling for a long time all their efforts to catch him, they in the meantime getting highly excited, but finally a squaw pounced upon him and held him up in triumph.

BOESCH'S HYDRAULIC MINING LAMP.

almost universally used. An engraving of this is shown on this page.

This is similar in appearance to a locomotive head-light, but is superior to it. The reflector is the same in both, but the burner for the mining lamp is better than in the other case. Mr. Boesch has made several styles of the lamp, but the engraving shows the most improved. The reflector is of furnished silver-plated metal. The lamp will effectually and clearly light up a gravel bank at a distance of 200 or 300 feet, which is the distance required. It is so arranged that while the lamp is stationary the reflector may be moved so as to throw the light up or down, and send it to any particular part of the bank to which the nozzle is directed. The small staple shown at the bottom of the reflector serves to keep the reflector in the desired position. This appliance is now deemed indispensable in all the large gravel mines, and Mr. Boesch makes numbers of them.

## The Yellow Jacket Mine.

The receipts of the Yellow Jacket mine for the fiscal year ending June 30th, were \$403,258, of which \$36,000 was from assessments. The disbursements include \$125,510 for labor, \$54,000 for wood, \$46,000 for mine supplies, \$118,000 for the new shaft, etc.

The following is a summary of work done in the mine during the past year: Drifts run, 2,212 feet; winzes sunk, 665 feet; re-timbered, 550 feet of old drifts, 130 feet of winzes and re-timbered 1130-foot station and 100 feet of main shaft between the 1020 and 1130-foot levels; cribbed it with 12x12 timber. Have also bored 1,337 feet of holes with the diamond drill for prospect purposes, thereby saving the cost of many feet of drifts. The machinery and workings of the old mine are, and have been, kept in good repair. The Superintendent's report says: Most of our prospecting work has been done on the 1930, 2030 and 2200-foot levels, and there still remains 300 feet south from the north line which has not been prospected below the 1940-foot level, and 250 feet north of the south end that has not been prospected below the 1740-foot level. The fear of cutting water has prevented the latter. We find on the 2030-foot level, the ledge fully 466 feet wide without reaching the east wall. The whole vein is filled with metal-bearing porphyry and quartz, all of it showing by assay the presence of gold and silver. On the 1930 and 2030-foot levels we found seams of ore varying in size (though ton narrow and mixed to pay to extract) assaying from \$10 to \$400 per ton. On the 2200-foot level we have not yet drifted sufficiently far from the winze to find the same. On the 2200-foot level we find the vein almost perfectly dry and quite easy to work, and through having good ventilation we find no difficulty from the heat of the ground, which by test is fully 140° Fahrenheit.

The new shaft is down 800 feet and new hoisting machinery is on the ground. They are also erecting a 40,000-gallon tank to supply the boilers and for protection from fire. Concerning the new shaft, Mr. Taylor, the Superintendent, says: When it reaches the present working levels of the mine, I feel confident that we can accomplish as much work as at present for less than 60% of the present cost, and our neighbors on the north will all be able to considerably lessen their expenses by working through the same. Though our disbursements seem large, the utmost economy has been observed, and I am in hopes, judging from the favorable appearance of the vein, that the stockholders will soon be rewarded by the discovery of a paying body of ore.

## The Coming Exhibition.

The managers of the Twelfth Industrial Exhibition, under the auspices of the Mechanics' Institute, are very busy arranging the details of the different departments. They are now at work appointing the committees on awards. The exposition building is being cleared out and arranged for the reception of goods. The horticultural garden will have many new features this year, and will be of special interest. A large landscape painting, covering the whole of one end of this building, is to be put up. A number of rockeries are being built also, which will be very handsome.

Those persons who intend to exhibit and who have not applied for space, had better do so immediately or they will lose their chance. The applications for space have exceeded those of any previous exhibition, already. A number of persons who made displays at the Centennial intend bringing their goods out here, so it behooves our local manufacturers and agents to put the best foot forward and get up as creditable displays as possible. Our citizens should do all in their power to extend the interest of our local exposition, which really represents a greater area of territory than any of the State exhibitions, or any except an international one. The managers of the fair are confident that the coming exposition will excel any previous efforts in every respect, and those persons who should exhibit and fail to apply for space in time, will be disappointed if they make any further delay. The exhibition will open without fail on the 7th of August.

**THE CHOLLAR-POTOSI.**—This mine produced last year \$710,941 in bullion and \$192,202 was received from assessments. The total receipts, including \$100,000 borrowed money, were \$1,042,684. The average yield of the ore was \$18.69 per ton. The cost of mining and milling was \$14.99, leaving a profit of \$3.70 per ton on the ore. The expenses of prospecting were, however, \$3.16 per ton on this ore, while the disbursements on account of the new combination shaft were \$4.72 per ton, which added to the expenses, show a loss of \$4.18 per ton. Twenty per cent. of the assay value of the ore was lost in the tailings. The mine has produced in twelve years 553,000 tons of ore, producing \$13,839,600 in bullion, about 38 per cent. of which was gold and 62 silver. For the past eleven years the mine has paid 44 dividends, aggregating \$3,079,925, and levied eleven assessments, aggregating \$1,358,502, leaving a balance in favor of stockholders of \$1,721,323. Of the gross bullion, 25 per cent. have been paid in dividends.

The North Fork mining company of Forest City have sent a ton of sulphurets to Nevada City to be worked by Oscar Maltman. The rock from this mine is very rich.

### Jablochkoff's Electric Candle.

Most of our readers are doubtless aware of the waste that goes on at the surface of many of our mines and collieries, where large heaps of coal, sometimes containing over three tons, are often burnt nightly, in order to afford light to the men engaged in loading into trucks the contents of the trams as they are brought up from below, and this because no cheap and trustworthy light could be found as a substitute for the above-named wasteful arrangement. The electric light was long ago proposed as a means of illuminating large spaces, but difficulties of detail have hitherto prevented its general application. The light obtained by passing the electric current through two carbon points kept at a certain distance apart, was indeed brilliant enough; but, owing to its being concentrated at one point, the very intensity was sometimes embarrassing, and also caused the projection of dark shadows that much impaired the efficiency of the light for manual operations. Again, owing to the difficulty of keeping the carbon points at the proper distance apart for preserving constant the luminous voltaic arc, the light was subject to variations of intensity, or even to total extinction, that raised a serious objection to its common use. Nor was it every found possible, with an electric lamp of the ordinary form, to maintain more than one light in the same electric circuit and with the same dynamo machine.

It was reserved for M. Paul Jablochkoff, an officer in the Russian engineering service, to introduce that element of simplicity into electric illumination which has made it easily and practically applicable to the purposes of every day commerce and industry. In previous electric lights, the carbon points were placed in a vertical line, and a complicated arrangement of clock-work was necessary to keep them at the proper distance apart. In the new electric candle, however, the carbons are placed side by side, with a non-conducting substance between them, which not only keeps constant the length of the voltaic arc but also causes a diffusion of light, owing to the insulating substance throwing out a flame instead of being merely a luminous point. The light is also rendered soft and pleasant to the eye by means of a shade of ground glass, so that the shadows of surrounding objects are not so marked as with other electric lights. This arrangement also enables several lights to be kept going in the same electrical circuit and by one induction machine. In this way the light is better distributed, so as thoroughly to illuminate a given area. The electric candle consists of two rods of carbon, circular in section, held by brass tubes joined together with cement, and having between them a non-conducting substance of which kaolin is the base. There is also a switch arrangement whereby one candle can be drawn out of the circuit when nearly exhausted and a fresh one substituted in its place without stopping the induction machine or more than momentarily intercepting the light.

We were invited last Friday evening to witness some experiments in illumination with these new electric candles at the West India Dock; and may say at once they were highly satisfactory, notwithstanding the temporary arrangements necessarily adopted for driving the magneto-electrical machine. Under a canvas stretched over an open court-yard were erected four standards, each carrying one of the candles, and together forming a parallelogram 45 by 20 feet. The electricity was produced by an induction machine of the Alliance Company, Paris, driven by a small portable engine. At a few minutes after 9 P. M. the electric current was passed through the circuit, which included the four candles. The whole space was thereupon lighted up with a beautifully soft and subdued light, of such power that, notwithstanding a loss of 50 per cent. owing to the shades, small print could be read with ease at twenty paces outside the parallelogram. If, at first, there were slight irregularities, which would be called flickering in a lamp or ordinary candle, these were doubtless due to the fact that the electrical current was not of uniform intensity, owing to the difficulty of keeping the portable engine, fitted only with an ordinary governor, at a constant speed. After remaining in action for a quarter of an hour, contact was broken; and four gas lamps, with four burners each, provided with silvered reflectors, were lighted, in order to show the contrast, which was very marked.

The party then ascended to the top of one of the warehouses, which was illuminated sufficiently for all practical purposes, with three electric lights, each equal to about sixty normal candles. They then proceeded on board a vessel lying alongside, which was thoroughly lighted up by a portable lamp on the quarter deck, and a fixed light on shore. It was manifest that the operations of loading and unloading could be carried on with this form of electric light, as well by night as by day, thus saving many a pound in demurrage. The glasses in the warehouse and on board were not frosted, but had a slightly blue tint.

The last demonstration was given with a modified lamp composed of a slip of kaolin suitably prepared, and put in connection with the secondary coil of the dynamo machine. This light, though not so intense as that previously described is, of course, more cheaply produced, and, it is believed, will be more suitable for office and domestic illumination.

About three hundred persons, including Mr. Warren Delarue, F. R. S., Sir J. McGarel Hogg, M. P., Captain Sale, R. E., Mr. E. J. Reid, M. P., Major de Winton, and a large number of

scientific men were present, and all appeared thoroughly satisfied with the successful issue of the demonstration. We believe these will be repeated, as far as practicable, at the South Kensington museum on an early occasion, when the general public will have an opportunity of witnessing them.

Some data will naturally be expected with regard to the cost of this new light. The four electric candles burning in the yard require an engine power equal to that of two horses, which in London costs about 4d. an hour. In addition to this, four lights consume about 1/4 yard of candle per hour, which may be valued at 1s.; therefore the whole cost in steam power and candles may be reckoned at 1s. 4d. per hour for the four electric lights. As these lights are equal to 400 gas jets, which in London would cost about 6s., a considerable saving is effected in current expenditure.

M. Jablochkoff's invention has been taken up by the *Société Anonyme des spécialités mécaniques réunies*, Paris, the director of which is M. Denayrouze, the inventor of the well-known mine respirator and lamp.—*Colliery Guardian*.

**SETTING A WATCH.**—If you want to be very accurate and are setting your watch by the stroke of the city clock bell, you must allow one second for every 1,100 feet the sound has to traverse from the bell to your ear.

### Contents of Pamphlet on Public Lands of California, U. S. Land Laws, Map of California and Nevada, Etc.

**Map of California and Nevada:** The Public Lands; The Land Districts; Table of Rainfall in California; Counties and Their Products; Statistics of the State at Large.

**Instructions of the U. S. Land Commissioners.**—Different Classes of Public Lands; How Lands may be Acquired; Fees of Land Office at Location; Agricultural College Scrip; Pre-emptions; Extending the Homestead Privilege; But One Homestead Allowed; Proof of Actual Settlement Necessary; Adjoining Farm Homesteads; Lands for Soldiers and Sailors; Lands for Indians; Fees of Land Office and Commissions; Laws to Promote Timber Culture; Concerning Appeals; Returns of the Register and Receiver; Concerning Mining Claims; Second Pre-emption Benefit.

**Abstract From the U. S. Statutes.**—The Law Concerning Pre-emption; Concerning Homesteads; Amendment Act Concerning Timber; Miscellaneous Provisions; Additional Surveys; Land for Pre-emption; List of California Post Offices. Price, post paid, 60 cts.

### Questions of the Times.

Which are the most reliable watches?

American watches, they are driving those of foreign make out of the market.

Which is the best American watch?

The New York watch, made at Springfield, Mass.

Why is it the best watch?

Because it is substantial in all its parts, constructed on the best principles and embodies those improvements which experience has shown to be the most desirable.

Why is the New York Watch so popular?

Because in buying one you are sure of getting a good time-keeper. While purchasing a watch of most other makes is like investing in a lottery—a great many blanks to one prize.

Which is the cheapest watch?

The most economical is the New York watch. For you can get one of these excellent time-keepers for less than it costs in a short time to patch up a poor watch, which benefits no one but the repairer.

Where can I get a New York Watch?

By addressing the long established, practical Watchmakers and Jewelers, DEWEY & JORDAN, 433 Montgomery St., San Francisco, who will send you a descriptive price list, including the following styles of movements: "John Hancock," "Geo. Sam. Rice," "Chas. E. Hayward," "Aaron Bagg," "Theo. E. Studley," "Chester Woolworth," "Frederick Billings," "Railway," "John L. King," "E. W. Bond."

**APPRECIATION ABROAD.**—We copy the following from the *Mining and Monetary Gazette*, of London, England: "We deemed it advisable, as affording valuable information to our readers, to publish in recent issues of *The Gazette*, the full text of the 'United States Mining Laws and Instructions,' by the Commissioner of General Land Office," taken from our talented contemporary, *THE MINING AND SCIENTIFIC PRESS*, of San Francisco. The documents have now been issued in a handsomely bound volume by Messrs. Dewey & Co., the publishers of our transatlantic contemporary, and it will be found very useful to those already interested in American mines, and to others who may be tempted to embark in that enterprise in the States."

SAN FRANCISCO, CAL., Jan. 23d, 1877.  
Messrs. DEWEY & Co.—Gentlemen: I received to-day my patent papers for my improved feed-boxes, which you have so kindly worked through for me, and I wish to add my testimony to that of your many other patrons as to your promptness and fair dealing in every respect. Thanking you for prompt attention to business in my case, I heartily recommend you to those in need of a patent solicitor, in preference to the many Eastern firms who flood this coast with their circulars and representations of cheap fees, etc. Again thanking you, I remain respectfully yours,  
J. O. JOHNSON.

WOODLAND, CAL., Aug. 8th, 1876.  
Messrs. DEWEY & Co.—Gentlemen: Your letter containing my patent for my Improved churn has come duly to hand, and you will please accept my many thanks for the prompt manner in which you attended to the business entrusted to your care, and I will take great pleasure in recommending you to any one having anything to attend to in your line. I am having a number of the churns put up, which will be ready for sale in a few weeks.  
Yours truly,  
JAMES ROOT.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us against the acts and mistakes of others.

### DEWEY & CO.

#### American & Foreign Patent Agents

OFFICE, 324 SANSOME STREET, S. F.

**PATENTS** obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

#### Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

#### Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

#### Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

#### Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

#### DEWEY & CO.

United States and Foreign Patent Agents, publishers Mining and Scientific Press and the Pacific Rural Press, 224 Sansome St., S. F.

### Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,  
MINING ENGINEER AND METALLURGIST.

**Roasting of Gold and Silver Ores**, and the Extraction of their respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$2.50 coin, or \$3 currency, postage free.

**Concentration of Ores** (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniures, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers as infallible. It does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

#### OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.

B. W. CROWELL—Amador, Placer, Calaveras and Tuolumne counties.

G. W. McGREW—United States.

A. C. KNOX—Plumas, Sierra, Lassen, Placer and Nevada counties.

C. N. WEST—Santa Cruz, Monterey and San Benito counties.

A. C. CHAMPTION—Sonoma, Marin and Mendocino counties.

A. U. STRONG—Lake, Napa and Solano counties.

ED. T. PLANK—Dakota Territory (Black Hills).

JOSEPH DIMMICK—Mendocino, Humboldt and Del Norte counties.

W. D. WHITE—San Bernardino and Los Angeles counties.

There are many persons who do not know how to stop a newspaper. They are more awkward about it than a country boy stealing his first kiss. The way to do it with satisfaction to both sides is to address the publisher by letter if you do not live near enough to call at his office. It is no way to notify the postmaster or some one else. Four postmasters in three will fail to notify the office of publication. They look upon it as your business more than theirs. The right way is as genteel and pleasant as the other is suspicious and shabby. If you owe for a few weeks or months over time, tender the amount due. It is a little thing, but it will be a great satisfaction to your conscience, as every one is presumed to have one of some kind. Stop your newspaper like a man, and your own self-respect and the esteem of the publisher is maintained. Then you can always look him in the eye or take him by the hand, and he will feel proud to think you were once one of his most gentlemanly patrons, and wish you would subscribe again.—*Exchange*.

### CALIFORNIA

### MILITARY ACADEMY.

## Steam Engines &amp; Boilers.

## NEW AND SECOND-HAND.

One Patent Straw-Burning, Portable Engine, (new,) fire box boiler, the best Portable Engine on the coast; built by Ransom, Sims & Head, Ipswich, England.

One Steam Fire Engine, second-hand, in excellent condition, with 200 feet leather hose, very cheap, just the thing for a small town. Button & Blake, builders, Waterford, N. Y.

One second-hand Stationary Engine, 14x30 inches, link motion, with or without hoist gear.

One second-hand Stationary Engine, 8x20 inch, with or without hoist gear.

One Upright Boiler, Horizontal Engine on wheels, Eastern make, 7x12.

One Upright Boiler, Horizontal Engine, San Francisco make, 6x12.

One small Stationary Engine, 3½x7 inch.

One Steam Boiler, 40 inches diameter, 16 feet long.

One 8x10 Straw-Burning Portable Engine.

One Traction Engine, three wheels, rubber tires, double cylinder, 6x10 inch; Thompson's patent, D. D. Williamson, builder, New Jersey.

One Stationary Engine, 10x20, just had a thorough repair, almost as good as new.

One Stationary Engine, new, 12x24, independent cut-off.

One 6x12 Engine and Boiler, can be mounted if required. Very cheap.

Various other second-hand Engines and Boilers for sale cheap.

J. W. RILEY,

P. O. Box 2361.

San Francisco.

## Buy the Best.

Before purchasing an American Watch, examine the different styles manufactured by the NEW YORK WATCH COMPANY, at Springfield, Mass. They are the latest and best improved manufacture. You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in fact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

One pack (20 styles) Acquaintance Cards, 10c. Sample for 3c. stamp.  
M. DOWD & CO., Bristol, Ct.

## \$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

CAUTION  
TO HYDRAULIC MINERS.

All persons, excepting those having the right by purchase from me, are hereby cautioned against using, or making, or selling any device for turning the discharge pipes of hydraulic machines which uses the deflecting force of the stream of water.

Any such device is an infringement of United States Letters Patent, granted to me on the 16th of May, 1876, and re-issued September 19th, 1876.

I have commenced suit against Richard Hoskin for infringing my said patent, and intend to prosecute all parties using such Deflectors without license from me, there being no other way to protect my rights.

Any parties wishing to purchase the right to use this device can do so by making application to me.

HENRY C. PERKINS,

North Bloomfield, Nevada County, Cal.

MINING ENGINEER and METALLURGIST.

P. O. Address: ALAMEDA, CAL.

Continued from Page 37.

running an adit on the lode from the gulch, and are in 90 feet. On Tuesday they struck a nice vein of ore, of good grade, some of it showing native silver.

**FREE AMERICA.**—At this time the mine furnishes employment for forty to forty-five men. Two parties of lessees, Messrs. McNamara and Myers, are working the west end. A flume sixty rods long bringing water from the Young America gulch for the use of the engine, &c., will soon be completed. The new fifteen horse power hoisting engine is in place; and the combined engine house and ore house, measuring 124x40 feet, is nearly finished. The engine shaft, which is sunk but to the first level, is a little over one hundred feet deep. It is heavily cribbed from top to bottom, is 8x3½ feet in the clear, and follows the dip of the vein, which inclines at an angle of about thirty degrees from the perpendicular, and ranges south thirty degrees.

**THE WHITE LODGE.**—This lode is situated on the east side of the Young America gulch and was discovered in February of the present year. It is improving with every fathom of development, and the mill runs average about 400 tons. A drift is run east 40 feet on the lode, and a shaft of a like depth is sunk near the breast of the drift. This is intended to be sunk about ten feet further, when a drift will be run in the vein.

This lode matter is clear white quartz, and the ore carries gray copper, antimony, copper pyrites, black sulphurets, and native silver. The dip of the vein is not less than forty-five degrees.

## Idaho.

**EMPIRE.**—Owyhee *Adalanche*, July 14: The developments in the Empire continue to be quite satisfactory. In the progress of operations on the ledge, from which so much fine rock has been extracted, the prospects have been such as to justify the belief that the richest portion of the ore body here is yet to be encountered. There are two large ledges in this mine, the old or main ledge having a straight course from the surface of the vicinity down. The other ledge inclines toward the old one at an angle of about 45°, and the junction is believed by practical men to be effected at a point about 700 feet below the surface. The slopes are yielding a fine supply of good ore, and there seems to be plenty of it in almost every direction. We visited the mine recently in company with Superintendent Crutcher, and were astonished to witness the ease displayed in chipping off rich seams, which seemed to abound at various points along the ledge known as the Hidden Treasure. This ledge seems to be nowhere less than two feet in width, and at many points branches three feet deep, being so liberally streaked with gold in some places as to give the lead the appearance of a most remarkable development.

**GOLDEN CHARIOT.**—At the Golden Chariot sinking operations commenced on Monday morning. The works are now in thorough condition for business, and the enterprising men will go forward with the least possible delay. The Superintendent has not a large but has a very efficient corps of workmen to aid him in this undertaking, on the final success of the developments connected with which the future welfare of the camp to a very considerable extent depends.

**SINKING** operations are now in progress in the Potosi. Much of the rock recently taken out will average 300 to the ton. There is a quantity of material ready for crushing, which will be forwarded to the mill next week.

A good supply of rich ore has been taken from the Belle Peck recently, and in every part of the mine where work is in progress, the indications are equally favorable. Some inconvenience has been experienced recently among the workmen in consequence of the existence of foul air in the mine. The trouble is about to be remedied.

The Henrietta mine, at Wagontown, has been turning out some very rich rock recently. It is looking better than ever.

**FRANK LEPLLEY** recently crushed two tons of rock from his mine in Wagontown, which yielded \$1,000. There is said to be abundance of good rock left in that mine, as well as other mines in that locality.

## Oregon.

**NEW GOLD MINES.**—*Mountaineer*, June 7: New gold mines have lately been opened by a party of miners, called the Grand Ronde Beaver Creek ditch and mining company, situated on Beaver creek, in the Blue mountains, about 20 miles west of Ore Dell, in Union county. From Mr. E. R. Horner, the foreman of the mine, who was in town on Thursday, we learn that the gravel is extensive, and that it prospects from 40 to 50 colors to the pan, with plenty of water and sufficient fall for erecting hydraulic apparatus. While in town, he purchased a hydraulic pipe from T. W. Miller, the tin and copper smith of The Dalles, and also made arrangements for getting a large amount of iron pipe made to be used instead of hose. The company is now engaged in completing a ditch to Ronde river, which will give them water during the entire year.

## Utah.

**SHAUNTEE.**—*Cor. Salt Lake Tribune*, July 14: The Frisco furnace is running finely and making plenty of bullion. The new Godde smelter is nearing completion and will be started to start up on the 1st of August. It is to be of the latest pattern, and will make our old furnaces look like Dutch ovens in comparison. The Shauntee furnace still remains idle. The miners are indignant at the idea of cutting wages down in this part, when the price of provisions is double what it is in Salt Lake. They say bring down the price of goods and then wages will follow. The mines are all looking about the same, and it is expected that four furnaces will start on the 1st of August, and run steadily from that on in Beaver county.

## Meetings and Elections.

**OVERMAN M. Co.**—July 13th. Directors—President, Geo. W. Beyer; Vice-President, R. F. Morrow; Trustees, Jos. Clark, J. H. Dohinson, R. Wegener; Secretary, Geo. D. Edwards; Superintendent, Chas. Forman.

**UNION CO.**—July 10th. Trustees—John W. Coleman, Robert Sherwood (President), R. M. Graves, L. T. Lazure, J. B. Russell, J. M. Buffington (Secretary). The receipts for the year were \$64,615, and expenses, \$51,263; balance on hand, \$13,346.

**NEWARK S. M. Co.**—July 16th. Trustees—A. H. Yazzell (President), Geo. F. Reeves, Jr., E. L. Wagner, Wm. Ashman, J. A. Fairweather. Officers—W. H. Allen, Jr., Secretary.

**YELLOW JACKET S. M. Co.**—July 16th. Trustees—J. G. Fair, Geo. Wallace, F. A. Trille, A. King and T. J. Taylor. The shareholders have chosen President and Superintendent, Vice-President, Geo. Wallace; Secretary, P. Ennes; Transfer Secretary, Jas. Newlands; Treasurer, Bank of Nevada.

**ROCK ISLAND M. Co.**—July 17th. Trustees—E. F. Stone, R. N. Graves, W. S. Lyle, J. M. Walker, W. F. Myers; President, E. F. Stone; Secretary, J. W. Clark.

**YOLGANO G. M. Co.**—July 10th. Trustees: Geo. Muck, A. Peck, Lucius Smith, John Eckart, Albert Heath. Officers—Secretary, E. A. Peck.

The hoisting works of the Sundermier mine, Calaveras county, were destroyed by fire last week. A candle in a miner's candlestick fell down and set the place on fire. The watchman was asleep and came near being burned up. The loss of the hoisting works will fall heavily upon the owners of the mine, who can ill afford to replace them. The works were entirely new, having been in operation but a few weeks, and very favorable progress was being made in the development of the mine.

## General News Items.

The rinderpest has broken out at Bethnal Green, England.

**GEN. McDOWELL** has telegraphed the War Department a strong defense of Gen. Kautz against the reports of the Arizona agents of the Indian Office.

**NICOPOLIS** has surrendered to the Russian army. The Cossacks have succeeded in crossing the Balkans and getting within 200 miles of Constantinople.

An effort is being made to obtain money in England at a low rate of interest for rebuilding St. Johns, New Brunswick. Two millions are wanted.

The State Department has ordered a thorough investigation of the reported Spanish outrage on the schooner *Rising Sun*, with a view to obtain full reparation, should the published statements be verified.

**SECRETARY McCARY** is reported as saying that, in case Mexico alleges the fact of invasion and protests or demands reparation, she has already furnished us a precedent, and therefore we have equal cause of complaint.

The training ship *Jamestown* went to sea Monday morning. The ship will proceed to Hilo, where the boys will be given an opportunity to visit the volcanoes, Mauna Loa and Mauna Kea, and will not return to port till November.

The Choctaw and Chickasaw Indian nations have brought suit against the Missouri, Kansas and Texas railroad on a claim of \$700,000 for ties, timber, masonry, coal, etc., used in the construction of that road. Plaintiffs claim that the property belongs to the nations in common, and not to individuals, who have no right to dispose of it in any way.

The Treasury Department has issued the 51st call for the redemption of 5-20 bonds of 1865 and consols of 1865. The call is for \$10,000,000, of which \$7,000,000 are coupon and \$3,000,000 registered bonds. Principal and interest will be paid at the Treasury Department on and after the 16th of October next and interest will cease on that day.

## EXTENSION OF THE SIGNAL SERVICE.

The Eastern people are calling for the extension of the signal service. And no wonder, for this is what a local paper says was done in a Pennsylvania town: "A man was blown two miles; a cow was carried 200 yards and dashed to death; the roof of a barn wound like a cord around a tree a quarter of a mile distant; osage hedges torn up; a tree two feet in diameter cut off as though it had been sawed; a heavy axle torn from a wagon and shot like an arrow through an adjoining house, and a number of other freaks were performed almost as startling." The paper from which we quote draws from these frightful instances the conclusion that the signal service of the country should be so extended that we would be able to announce the hurricane hours beforehand, so that people could anchor things down. It says: Signal stations should be increased, more scientific men should be employed, and by Government expense, the conclusions reached by these savants be daily telegraphed to the press. In nothing is the steady advance of this age better exemplified than in this matter of deciding from the atmospheric conditions surrounding a district what is going on in other districts, and what may be expected in the near future. It partakes of the marvelous, if not of the infinite, when man has reached conclusions in science which enable him to look out upon a clear sky and say with certainty: "A hurricane is on the march; it is yet a thousand miles away, but it will be here to-morrow at noon, accompanied with rain and hail and measureless destruction." Such a triumph of science should be held as divine, as something given in mercy to mankind, and the governments of the earth should build to it temples on every mountain top and on every ocean's shore.

## RAILROADS MUST COMPLY WITH THE LAW.

We read a decision by Judge McKee to the effect that the railroads must comply with the request of the railway commission, created two years ago, and furnish them with correct reports of their business, so that the reports may be laid before the Legislature and serve as a basis for whatever legislation the facts may seem to warrant. This is one more link in the chain which will bring the railways to a realization that they are creatures of the State and cannot rise higher than their Creator. Judge McKee decides wisely that because the State wants this information there is no reason to infer it means to use it unconstitutionally. The people are decided that they will know more about the management of railroads and how it is that peerless fortunes can be built up by individuals and yet the railroads be pronounced unprofitable.

**GOOD WORK.**—During the thirty days of the fiscal month of the Consolidated Virginia the California mill crushed 9,524 tons of ore, being an average of over 317 tons per day. The *News* says this is not only the largest amount ever reduced by any of the Comstock mills during a like number of days, but is the best average per stamp yet recorded, being over five tons per day for each stamp run.

## National Immigration Bureau.

The Fairmount Park Commissioners, who represent the city of Philadelphia, have given to Mr. Lee Crandall the use of Machinery hall, in Fairmount park—a building which covers over 14 acres—for the establishment of a National Immigration Bureau.

In this building there will be exhibited, free of charge, all contributions the different States and Territories may see fit to make. These are expected to embrace specimens of minerals, vegetable products, manufactures, works of art; the laws, statistics and rates of taxation of the different States; maps, charts and full descriptions of lands for sale, together with an abstract of titles, and specimens of all kinds that will represent the resources of each State and Territory, so as to enable the Manager of the bureau to answer any question emigrants may want to ask. Everything contributed will be thoroughly exhibited, free of charge, and without partiality or favoritism.

The object of this bureau is to foster and encourage immigration in all the States and Territories that desire it. Hence they should all be represented. Specimens of their resources should be on exhibition for the enlightenment of emigrants who are selecting new homes.

Every route by sea and by land, to and from all the States, individually and collectively, will here be presented to view as fast as received, and the rates of fare and other particulars given when required.

Parties having inducements to offer immigrants, should be full and explicit in their descriptions, so as to be readily comprehended. Those who have lands to offer cannot be too particular in giving locations, descriptions, titles, prices, character of soil, &c.

The authorities in all the States and Territories will readily see the importance of being represented in this Bureau, and of placing on exhibition specimens of their resources. There is abundant room for all exhibits, and all will be shown to the best advantage. Newspapers and periodicals, when received, are carefully filed for inspection.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: Modoc Con. July 10th, \$4,340, total to date, \$16,638; Grand Prize, 11th, \$3,100; Raymond & Ely, 9th, \$13,332; California, 12th, \$193,353.91; total to date, \$259,740; Con. Virginia, 12th, \$313,850.03; total for June, \$1,394,678.03; Northern Belle, 10th, \$6,303.34; Tybo Con., 10th, \$4,005.03; Tybo Con., 12th, \$4,230; Northern Belle, 12th, \$6,264; California, 14th, \$119,600; total to date, \$379,340; Con. Virginia, 14th, \$45,389, first shipment for July; Standard, 14th, \$17,363.33; Tybo Con., 14th, \$7,992.32; total this month, \$33,718.88; Leopard, 17th, \$3,700; Ophir, 13th, \$8,865.81; Modoc, 16th, \$3,819, total to date, \$24,550.48; Chollar, 17th, \$5,521.89.

**JOHN H. LICK**, administrator of the estate of James Lick, has been notified that Sarah A. Gibson, Mollie E. Hewett, John H. Sidebottoms and Susan L. Harris claim to be the immediate descendants of Jacob Lick, a brother of James Lick, and as such descendants and heirs-at-law are entitled to a distributive portion of his estate. And further, the administrator is notified to contest the various conveyances of property made by said James Lick for benevolent, public and charitable purposes, on the ground that when he made such conveyances he was of unsound mind.

**ASBESTOS.**—We have received a magnificent specimen of asbestos from the mine of R. R. Craig & Son. The fiber is about a foot and a half long and as soft as silk. It is by far the finest specimen of this mineral we have yet seen.

The Monterey coal mine is being opened and developed thoroughly. There are now about 125 men employed in opening the mine, building walls, etc.

LEAD has fallen in Liverpool to £20 5s to £20 10s per ton for good ordinary brands.

FIVE hundred men have lately joined the Miners' Union in Virginia City.

## Signal Service Meteorological Report.

Week Ending July 17, 1877.

HIGHEST AND LOWEST BAROMETER.

"More than Pleased."

OCEOLA MINE, NEVADA CO., CAL., April 19th, 1877. MESSRS. DEWEY & Co.—Gentlemen:—We are more than pleased with your professional ability in the management of our application, and will always recommend your competency as Patent Attorneys, and your honorable and gentlemanly dealings with clients. Truly and respectfully yours, LOUIE R. TULLOCH. THOMAS D. TULLOCH.

## 202 Sansome Street.

DEWEY & Co.'s PATENT OFFICES, MINING AND SCIENTIFIC PRESS AND PACIFIC RURAL PRESS newspaper offices, and the SCIENTIFIC PRESS ENGRAVING establishment will be found at the above place, (No. 202 Sansome Street, N. E. Corner of Pine, opposite the Pacific Bank), after July 21st, 1877. Just three-fourths of a block south of our old location.

## MINERALOGY AND ASSAYING.

1. Bodemann on Assaying—Lead, Silver, Gold, etc., 12mo. \$2.50
2. Brush—Manual of Determinative Mineralogy, 1 vol. 8vo., 2d Edition. 3.00
3. Dana—Descriptive Mineralogy, 900 pages, 8vo., 5th Ed. 10.00
4. Dana—Text-book of Mineralogy and Crystallography, new work, 800 wood cuts and colored plate. 5.00
5. Kert's Metallurgy—Gold, Silver, Lead, Copper, Zinc, etc., 3 vols., 8vo., separately. 10.00
6. Mitchell's Assaying—by Wm. Crookall, 8vo., 10.00
7. Rickett's Assaying Laboratory Processes (new). 2.50

Orders for Foreign Books, etc., forwarded Semi-Monthly.

Send for Circulars and Catalogues.

JOHN WILEY & SONS, 15 Astor Place, N. Y.

JOHN L. BOONE,

Attorney and Counsellor at Law,

PATENT LAW A SPECIALTY.

Office, 202 Sansome St., Cor. Sansome and Pine Sts., San Francisco.

Ridiculous ideas are entertained about purgatives. It is dangerous to scourge the stomach, to rasp the bowels, to prostrate the nervous system with furious evacuations. Nature has given a sample, in the famous Seltzer Spring, of what the bilious, constipated, or dyspeptic system needs for its relief, and so.

Tarrant's Effervescent Seltzer Aperient Science has improved on nature by combining all the valuable ingredients of the German Fountain in a portable form, and uniting those which have no medicinal virtues. This agreeable and potent saline alterative changes the condition of the blood and purifies all the fluids of the body. Sold by all druggists.

## W. T. GARRATT'S BRASS and BELL FOUNDRY SAN FRANCISCO.

MANUFACTURER AND IMPORTER OF  
Church and Steamboat BELLS and GONGS,  
BRASS CASTINGS of all kinds,  
WATER GATES, GAS GATES,  
FIRE HYDRANTS,  
DOCK HYDRANTS,  
GARDEN HYDRANTS

A General Assortment of Engineers' Findings.

For Ventilating Mines and for Smelting Works.  
HYDRAULIC PIPES AND NOZZLES,  
For Mining Purposes.  
Garratt's Improved Journal Metal.  
IMPORTER OF  
IRON PIPE AND MALLEABLE IRON FITTINGS.  
ALL KINDS OF  
WORK AND COMPOSITION NAILS,  
AT LOWEST RATES.

PATENT DETACHABLE TOOTH SAWS  
Manufacture, 17 & 19 Fremont St., S. F.

## Mining and Assaying Offices, 504 Washington St., SAN FRANCISCO.

Author of the Explorers', Miners' & Metallurgists' Companion  
672 pages, 63 Illustrations (Second Edition). Price, \$10.50  
The Prospector's Patent "Wes. P. T." Assayer..... 100.00  
The Testing machine for Gold, Silver, Lead, Etc..... 40.00  
CHARGES FOR ASSAYING.—Gold and Silver, \$3;  
Gold and Silver with Lead or Copper, 5; Copper, Iron, Lead  
or Antimony, \$3; and all other metals, \$5 each.  
Qualitative or Quantitative Analysis of Ores, \$10 or \$25;  
Copper, \$10 or \$20; Water, \$25 or \$75; Soils, \$25 or \$50.  
Minerals tested at \$2 per Metal.

HYATT'S LIFE BALSAM.  
As a conqueror of Rheumatism, Gout, Neuralgia, and  
all the diseases arising from impurity of  
blood, the old and reliable Family Medicine, Hyatt's Life  
Balsam, stands unequalled, as proven by over 300,000 great  
cures during the past 30 years. It is a radical vegetable  
compound of Sarsaparilla, Dock, Quinaquina, etc., and a  
permanent cure. Sold by all druggists and country gro-  
cers. Take nothing else, and if they haven't it we will  
send by express, boxed, everywhere, at \$1 and \$1.25 per  
bottle; \$5 and \$6.50 half doz. HYATT & HYATT, 240 Grand  
Street, New York.

## MINING CLAIMS IN MONTANA.

Some good mining claims near Sheridan, Montana  
Territory, can be purchased at present on very favorable  
terms. Positive information can be obtained by address-  
ing  
D. B. NOBLE,  
Sheridan, M. T.

## Dewey & Co. { 224 Sansome St. } Patent Ag'ts.

## Mining and Other Companies.

Persons interested in incorporated shares  
will do well to recommend the publication  
of the official notices of their companies  
in this paper, as the cheapest appropriate  
medium for the same.

### Bella Union Quicksilver Mining Com- pany.—Location of principal place of business, San Fran- cisco, California. Location of works, Napa County, Cal- ifornia.

Notice is hereby given that at a meeting of the Board of  
Directors, held on the twenty-eighth day of June, 1877, an as-  
sessment, (No. 2), of ten cents per share was levied upon the  
capital stock of the corporation, payable immediately in U. S.  
gold coin, to the Secretary, at the office of the company,  
No. 312 Montgomery Street, San Francisco, Cal.

Any stock upon which this assessment shall remain unpaid  
on the third day of July, 1877, will be delinquent, and ad-  
vertised for sale at public auction, and unless payment is  
made before, will be sold on Saturday, the twenty-fifth day  
of August, 1877, to pay the delinquent assessment, together  
with costs of advertising and expenses of sale. By order of  
the Board of Directors, ABRAHAM HALSEY, Sec'y.

### California Fruit Growing Associat-on.—

Principal place of business, San Francisco. Location of  
property, El Dorado county, Cal.

Notice is hereby given, that at a meeting of the Board of  
Directors, held on the second day of July, 1877, an as-  
sessment of \$1.50 per share was levied upon the capital stock  
of the corporation, payable immediately in U. S. gold coin, to  
the Secretary, at 331 Sansome Street, S. F.

Any stock upon which this assessment shall remain unpaid  
on the fourth day of July, 1877, will be delinquent, and ad-  
vertised for sale at public auction, and unless payment is  
made before, will be sold on Monday, the twentieth day of  
August, 1877, to pay the delinquent assessment, together  
with costs of advertising and expenses of sale.

Office, 331 Sansome Street.

### Consolidated Bonanza Gold and Silver

Mining Company.—Location of principal place of busi-  
ness, San Francisco, California. Location of works, in  
El Dorado and Washoe Valley Mining District, Ormsby  
County, Nevada.

Notice.—There is delinquent upon the following de-  
scribed stock, on account of assessment No. 1, levied on  
the fourth day of June, 1877, the several amounts set  
opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Hobbs, C. S.	1	100	10 00
Hobbs, J. K. C.	2	50	5 00
Carpenter, D. A.	5	50	5 00
Hobbs, C. S., Trustee.	6	5000	500 00
Hobbs, C. S., Trustee.	8	250	25 00
Hobbs, C. S., Trustee.	10	20	2 00
Hobbs, C. S., Trustee.	11	5	50
Hobbs, C. S., Trustee.	12	20	2 00
Hobbs, C. S., Trustee.	15	100	10 00
Hobbs, C. S., Trustee.	18	1000	100 00
Hobbs, C. S., Trustee.	10	100	10 00
Hobbs, C. S., Trustee.	20	300	30 00
Hobbs, C. S., Trustee.	21	200	20 00
Hobbs, C. S., Trustee.	22	1000	100 00
Hobbs, C. S., Trustee.	23	9250	925 00
Hobbs, C. S., Trustee.	24	25	2 50
Hobbs, C. S., Trustee.	27	25	2 50
Hobbs, C. S., Trustee.	28	250	25 00
Hobbs, C. S., Trustee.	30	50	5 00
Hobbs, C. S., Trustee.	31	200	20 00
Huber, Joseph.	34	55	5 50

And in accordance with law and an order of the Board  
of Trustees, made on the fourth day of June, 1877, so many  
shares of each parcel of such stock as may be necessary  
will be sold at public auction, at the office of the company,  
No. 10 First Street, San Francisco, California, on Tuesday,  
the thirty-first day of July, 1877, at the hour of 3 o'clock  
p. m., of said day, to pay said delinquent assessment  
thereon, together with costs of advertising and expenses  
of sale.

Office, No. 10 First Street, San Francisco, Cal.

### Excelsior Silver Mining Company.—Loca- tion of principal place of business, San Francisco, Califor- nia. Location of works, Potosi District, Lincoln County, Nevada.

Notice is hereby given that at a meeting of the Board of  
Directors, held on the tenth day of July, 1877, an as-  
sessment of ten cents per share was levied upon the cap-  
ital stock of the corporation, payable immediately in U. S.  
gold and silver coin, to the Secretary, at the office of the  
company, 306 Post Street.

Any stock upon which this assessment shall remain unpaid  
on the tenth day of August, 1877, will be delinquent  
and advertised for sale at public auction, and unless payment  
is made before, will be sold on Monday, the twenty-seventh  
day of August, 1877, to pay the delinquent assessment, to-  
gether with costs of advertising and expenses of sale.

Office, 306 Post Street, San Francisco.

### Mariposa Land and Mining Company of California.—Location of principal place of business, San Fran- cisco, California. Location of works, Mariposa County, California.

Notice.—There is delinquent upon the following de-  
scribed stock, on account of assessment No. 11, levied on  
the sixth day of June, 1877, the several amounts set  
opposite the names of the respective shareholders, as follows:

## Iron and Machine Works.

### PACIFIC ROLLING MILL COMPANY,

SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON

### Every Variety of Shafting,

Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames,

### Hammered Iron of Every Description and Size.

Orders addressed to PACIFIC ROLLING MILL COMPANY, P. O. Box 2032, San Francisco, Cal., will receive prompt attention. Office: 16 First Street.  
The highest price paid for Scrap Iron.

### THE RISDON Iron and Locomotive Works,

INCORPORATED.....APRIL 30, 1868  
CAPITAL.....\$1,000,000.

#### LOCATION OF WORKS:

Corner of Beale and Howard Streets,

SAN FRANCISCO.

Manufacturers of Steam Engines, Quartz and Flour Mill Machinery, Steam Boilers (Marine, Locomotive and Stationary), Marine Engines (High and Low Pressure). All kinds of light and heavy Castings at lowest prices. Cams and Tappets, with chilled faces, guaranteed 40 per cent. more durable than ordinary iron.

#### Directors:

Joseph Moore, Jesse Holladay, C. E. McLane,

### ÆTNA IRON WORKS,

MANUFACTURERS OF .

### IRON CASTINGS

### and MACHINERY

OF ALL KINDS.

Fremont Street, Bet. Howard and Folsom

SAN FRANCISCO.

### SHEET IRON PIPE.

### Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle and box introduced by this company, and guaranteed to outlast any other wheels made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

### SACRAMENTO BOILER WORKS,

37 Fremont St., cor. Mission, S. F.

### HALL & KELSHAW,

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks, Hydraulic Pipe, Oil or Water Tanks, Ore and Water Buckets, Gasometers, Girder, Bridges and Iron Ship Building.

### ALL KINDS OF SHEET IRON WORK.

Repairing promptly attended to at the lowest possible terms.

### STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

### Miners' Foundry and Machine Works,

CO-OPERATIVE,

First Street, bet. Howard and Folsom, San Francisco

Machinery and Castings of all kinds.

### McAFEE, SPIERS & CO.,

BOILER MAKERS AND GENERAL MACHINISTS,

Howard between Fremont and Beale Sts., San Francisco

## PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,  
RANKIN, BRAYTON & CO.,

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY, INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, Etc., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agente for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster Rock Drills and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

## IMPROVED PORTABLE Hoisting Engines,

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery.

## PHELPS MANUFACTURING COMPANY,

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle Work, Car Frames and Bolts, Machine Bolts, Set Screws and Tap Bolts, Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS. HOT AND COLD PRESSED HEXAGONAL AND SQUARE NUTS, WASHERS, BOLT ENDS, TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,

SAN FRANCISCO, CAL.

## THOMPSON BROTHERS, EUREKA FOUNDRY,

Light and Heavy Castings of Every Description Manufactured.

Sole Proprietors and Manufacturers of

Lynch's Ventilating and Illuminating Tile, The Only Illuminating Tile Manufactured for Lighting Cellars, Basements and Dark Rooms which provides proper ventilation for such places.

129 and 131 Beale Street,  
BET. MISSION & HOWARD, SAN FRANCISCO

## CALIFORNIA BRASS FOUNDRY,

No. 125 First Street, Opposite Minna,  
SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE.

J. H. WEED.

V. KINGWELL.

## California Machine Works,

119 BEALE STREET, SAN FRANCISCO.

## Machinery.

### The Ingersoll Rock Drill

Is Extensively Used in the East and

### TAKES THE PLACE OF ALL OTHERS,

Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other Drill in the market. It has but few parts, is easily handled, being light, and has AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

(Room 10,) 320 Sansome Street

## The Gardner Automatic Safety-Stop Governor.

MORE THAN TEN THOUSAND NOW IN USE.  
EVERY ONE WARRANTED.

SEND FOR DESCRIPTIVE CIRCULAR AND PRICE LIST.

When all others fail, buy a "Gardner." We have all sizes of these celebrated Steam Governors on hand at all times.

BERRY & PLACE,

Selling Agents for the Pacific States,  
Cor. Market & Fremont Sts., S. F.

## THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—23 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 25 cents.....	40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 61

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in Peavine District, Nev., and at the Eschequer mill, Alpine Co., Cal. For further information, apply to

D. J. O'HARRA,  
Reno, Nevada.

## BAKER'S ROTARY PRESSURE BLOWER (FORCED BLAST.)

WARRANTED SUPERIOR TO ANY OTHER.

These goods are specially adapted for the use of FARMERS, MECHANICS, MINERS, and WORKING MEN in general. They are manufactured of the Best Material, and in a Superior Manner. A trial will convince everybody of this fact.

Patented May 12, 1873.

USE NO OTHER, AND INQUIRE FOR THESE GOODS ONLY.

MINERS, write for your paper.

# AVERILL MIXED PAINT,

Was awarded the Highest

## MEDAL AND DIPLOMA

AT THE CENTENNIAL EXHIBITION FOR A READY MIXED PAINT

THIS CELEBRATED PAINT IS MANUFACTURED BY THE

## CALIFORNIA PAINT COMPANY.

THIS PAINT IS MIXED READY FOR USE.

THE PUREST WHITE, AND OF ANY DESIRED SHADE OR COLOR.

It will not peel, crack, nor chalk off, and will last twice as long as the best white lead, prepared in the ordinary way. Is cheaper, handsomer, more durable and elastic than the best of any other paint.

Extract From the REPORT OF THE CENTENNIAL COMMISSIONERS.

"This Paint is quite different from paints in general use. \* \* \* Work which has been done with it, some of it exposed for years to the moist atmosphere of the sea-shore, establishes its great durability. \* \* \* It is mixed ready for use, easily applied, of great beauty, and economical."

Extract From the REPORT OF THE FRENCH (CENTENNIAL) COMMISSION.

"It possesses merits unattainable by the old method of combining paint. \* \* \* It can be applied with great facility and perfect regularity; dries with a rich, glossy surface, and will not chalk or crack off. \* \* \* It never separates, is always ready for use, and will not spoil when exposed to the air. \* \* \* It can be applied by any one whether a practical painter or not."

For Sample Cards and Circulars, Address CALIFORNIA PAINT COMPANY, 27 Stevenson Street, S. F.

## PATENTED CAST STEEL SHOES AND DIES.

Guaranteed Cheaper than the Best Iron.

IMPORTANT NOTICE.

Reduction in Price from 16 Cents  
to 12 Cents Per Pound.

Owing to our largely increased business, the present low price of iron from which our Steel is manufactured, and the improved facilities for casting and forging, we take great pleasure in announcing that from and after this date we will supply our IMPROVED CAST AND FORGED STEEL SHOES AND DIES FOR QUARTZ MILLS at twelve cents per pound, delivered at San Francisco or Sacramento, instead of sixteen cents, as heretofore.

We also furnish Steel Plates for Blake and other Ore Crushers, Steel Gut Gearing, etc., for Mills and Hoisting Works, Steel Pan Shoes, Battery Cams and Tappets, etc., etc.

Address all orders, with dimensions or drawings, to

CAST STEEL SHOE & DIE CO.,

## NATIONAL DRILL AND COMPRESSOR CO.,

97 LIBERTY STREET, NEW YORK CITY,

MANUFACTURE AND ERECT

All Kinds of Mining Machinery, Mine Locomotives, Diamond Drills, Stamp Mills and Furnaces of All Kinds,

### HOISTING AND PUMPING ENGINES,

The latter a specialty up to ten foot bore cylinder, with Differential Valve Motion, superior to the Davy. Also their celebrated **Air Compressors and Rock Drill**, the victor of every Field—more work and Greater Durability Guaranteed than any other Machine built.

TRIALS ASKED AGAINST ALL COMPETITORS!

Specifications and Information Furnished at their PACIFIC COAST AGENCY, office with

**BERRY & PLACE, San Francisco, California.**

MACHINERY OF ALL KINDS BUILT FROM DRAWINGS AND SPECIFICATIONS WITHOUT COST FOR PATTERNS.

## TWELFTH INDUSTRIAL EXHIBITION,

UNDER THE AUSPICES OF THE

**MECHANICS' INSTITUTE, SAN FRANCISCO, AUGUST 7th, 1877.**

The Board of Managers have the honor to announce that the TWELFTH EXHIBITION will be opened to the public on TUESDAY, AUGUST 7th, 1877, and continue open for at least 30 days thereafter. The Exhibition will be held in

### THE GRAND PAVILION,

Market, Eighth and Mission Streets, and easily accessible by six lines of City cars.

### THE EXHIBITION BUILDING---EXOTIC GARDEN---MECHANICAL ANNEX.

The BUILDING is 200 feet wide, 550 feet long, and 100 feet high, with a gallery around the inside 50 feet wide, beside a promenade 16 feet wide and 1,000 feet in length, from which an unobstructed view of the interior is obtained.

In addition to the above space there will be an EXOTIC GARDEN, 70 by 220 feet, for the display of the Fruits and Flowers of this Coast. Also, A MECHANICAL ANNEX, 200 by 50 feet, for the display of special Machinery.

A large and powerful engine will furnish the motive power for all machinery required to be in motion, while steam and water will be supplied in ample quantities to such machines or appliances as require them. The main line of shafting is 500 feet in length, with sufficient pulleys for all requirements.

### THE ART GALLERY

Is 400 feet in length and 50 feet wide, well lighted by skylights during the day and at night by the most improved reflectors. It will be made specially attractive, both in Pictures and Statuary. Many noted works of art are already promised, and it is confidently expected this department will excel anything ever before seen on this coast.

Over 6,000 gas lights will be used to illuminate the building during the evening. Four thousand seats will be provided for visitors. Also, a first-class restaurant, where refreshments of all kinds can be obtained at moderate prices.

### A GRAND INSTRUMENTAL CONCERT

Will be given each afternoon and evening by an orchestra composed of the best musical talent on this coast, and under the leadership of an experienced and popular conductor.

### PREMIUMS.

In accordance with the general request of exhibitors, the management have decided to offer liberal premiums at this Exhibition, consisting of medals and cash, all to be for the first degree of merit only. The medals will be of a new design, three and one-half inches in diameter, and similar to those awarded at the late Centennial exhibition.

A carefully prepared classified list of premiums will shortly be published.

Articles may be entered for competition or for exhibition only; if for the former they must be so designated when placed in position.

It is important that all parties intending to contribute to this Exhibition should give early notice of the amount and kind of space required.

A copy of the premium list, blank applications for space, rules and regulations, and any information regarding the Exhibition will promptly be given or sent by addressing the Secretary of the Twelfth Industrial Exhibition, San Francisco, Cal.

# MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.,  
Patent Solicitors.

SAN FRANCISCO, SATURDAY, JULY 28, 1877.

VOLUME XXXV.  
Number 4.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

**COAL ELEVATOR.**—John A. Woodward, S. F. This invention relates to an improved machine for unloading cargoes of coal and other similar substances from the holds of ships and at the same time screening the coal and delivering it into carts upon the wharf. The machine is constructed upon the elevator plan and is made in two parts, each of which is portable, so that the machine can be easily moved from place to place and adjusted to the location and peculiar surroundings of the vessel. One of these parts is supported on the vessel which is to be unloaded, and consists of the frame work around which the endless chain travels, while the other part supported upon the wharf consists of the reservoir or hopper into which the screened coal is dumped by the elevator buckets and from which it is delivered into the carts. The operation of the machine is as follows: The upright frame is lowered down the hatchway of the vessel by means of a shaft, pinions, and rack until a semi-circular box or trough rests upon the coal in the ship's hold, where it is held by a ratchet and pawl. Power is then applied to the driving shaft and the endless belt with its buckets is set in motion. The coal is shoveled into the box or trough, from which it is taken by the buckets and carried up over the frame and cast upon the screen. The screenings or fine coal pass through the perforations in the plate and are directed by an apron or chute over the side of the box upon the wharf, while the merchantable pieces of coal fall into a box or reservoir provided for them.

**AQUARIUM.**—Mathew Palen and Daniel Sexton, San Bernardino. This invention consists in constructing aquariums in such a manner that a portion of the water can be raised into a chamber which extends above the level of the water in the main tank and sustained there by atmospheric pressure so that the fish in the aquarium can pass from the main tank into this elevated chamber and back again at will. This invention can be applied in a variety of ways, so as to produce mysterious and illusory effects.

## The Mechanics' Institute Fair.

Arrangements are being perfected in all the departments of the Mechanics' Institute Exhibition. Workmen are overhauling the building and goods are coming in rapidly. Unusual demands for space have been made. To relieve the pressure an addition of 100x100 feet will be made on the east side of the Market street end of the structure. Workmen are now engaged in taking the seats out of the pavilion and otherwise preparing it for the reception of goods. The garden will be adorned with new features, principally in the matter of rockeries and a waterfall. An addition will be made to the large fountain in the center of the main building, and in the tank or basin thus added will float working models of monitors and other vessels of war. These will be from Mare Island. The exhibits from the Eastern States will be much larger than usual, and will include several that attracted attention at the Centennial.

Ira H. Chapman, for many years an engineer of the fire department, has been appointed Superintendent of the engine department.

Superintendent Gilmore is at the pavilion locating the different exhibits. The large painting for the south end of the garden has been completed and is spoken of as very handsome. Altogether the prospect is good for a much better exhibition than ever before.

An advance edition of the MECHANICS' FAIR DAILY, to be published by Dewey & Co. during the fair, will be issued next week.

The latest war news is to the effect that England is becoming very restive on account of Russian success, and intervention is threatened.

## Diagonal Planing and Polishing Machine.

In establishments where cottage and chamber furniture is made there are several kinds of planing required. First, common surfacing or thickening of lumber for inside work. Second, smooth planing of panels, and other outside surfaces. Third, smoothing of door and similar frame work parts, after they are made up.

In carpenters' and joiners' shops the same classes of work have to be done; so, also, in

planing, tooth planing, scraping and sand-papering, in the cases referred to, and produces the best quality of surface for about the same amount as common machine surfacing costs. Several months of successful use in the best walnut furniture factories in New York City, has decided that it is perfect for the uses for which it is intended.

A glance at the cuts will show that in its entirety, it is a diagonal planing and polishing machine, the component parts of which are, a Woodworth planer of ordinary type, with the cylinder so constructed that its position may be

ultaneously with the polisher; in this case, stuff enters with rough, uneven surfaces, to emerge planed and polished ready for oil, filling, varnish or paint.

For planing and polishing wide walnut and other hard wood boards, a reciprocating polisher, or cylinder polisher, is used after it passes the disk. (It is not shown in these cuts). In ordinary doors and frame work the disk works with the grain. The cost of common surfacing is the same as with ordinary planers, that of smooth planing panels and frame work and planing and polishing, from fifty to one hundred per cent. greater.

The machine is the invention of Mr. Wm. R. Norris, of Fort Ann, N. Y., well known for several years past as the introducer and manufacturer of the diagonal planer and diagonal planing and polishing machines, to be found in nearly all the important door, sash and blind factories of the East. What the latter machines do for door, sash and blind manufacturers the new machine is surpassing in the case of furniture factories and the other trades mentioned. Further information can be obtained by addressing the inventor and manufacturer, as above.

## Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective Superintendents on file at the offices in this city:

In the Overman the drift which was being run north on the 1400-foot level was extended 21 feet, at which point a connection was made with the Belcher south drift on the 1600-foot level. The current of air is very strong, but hot; temperature, 105°.

The Crown Point company are cleaning out some of the old drifts on the 160 and 300-foot levels, but have not yet reached the point at which it is believed considerable ore may be found. They have rented the company's mill, the Rhode Island, to Mackay & Fair, at \$1,500 per month.

The north drift of the Andes is still turning out some low grade ore, but not enough to keep the mill running, so it was compelled to shut down for the present.

North drift 1600-foot level of the Mexican shows a decided improvement, being all in nice vein matter, with stringers of quartz coming in.

The Superintendent of the New Coso says: There has been marked improvement in the quality and width of ledge in stopes. Since I wrote last I am taking out ore superior to any yet extracted, with every prospect of continuance. The north drift from foot of winze is now in good pay ore, and the quality is improving.

They have had to put a blower in the Panther mine, as the air has been quite bad.

Men have been compelled to stop sinking main shaft at the Tybo Con. mine and timber the same, the ground growing very hocky and soft and dangerous, and they thought it better and cheaper to timber to the 7th level at once than to partly timber it.

The Chollar-Potosi turned out last week 521 tons of ore, assaying \$22 per ton.

An improvement has taken place in the face of south lateral drift 1000-foot level of the Justice; the width of the vein which produces the ore is three feet; the whole vein has a more lively aspect. The upraise and stopes from each end continue to develop a body of fair milling ore.

The Ophir is hoisting and shipping the usual amount of ore to the Winfield mill.

The Eureka Consolidated letter is as follows: The mine shows decided improvement at all points at which work is being done; the fifth and sixth levels showing great improvement during the past week. The third level is still in hard limestone, but with good indications for ore in face of drift. Connections have been made from 70 feet above the fifth level to 100 feet below the ninth level, a distance of 580 feet, all the way in ore of about the same grade as that smelted during the last six weeks. The furnaces have been running well, having produced 328,379 pounds of hullion from 759 tons of ore during the past week. Everything working well at mines and furnaces.

NORRIS DIAGONAL PLANER FOR HEAVY SURFACING.

the manufacture of cabinet organs; in building railroad and street passenger cars; the inside finish of vessels; some agricultural implements; wagons and a large list of other articles.

The common planing is usually done with ordinary planing machines; the smooth planing with panel planers and hand planes; the smoothing of doors and frames with hand

changed at will, from its usual one of square across, to diagonally, or vice versa; and a revolving disk sand-paper polishing machine, all constructed so as to be worked separately or conjointly, as necessity requires. It has various rates of feed adapted to the different kinds of work it does, i. e., heavy fast surfacing, smooth planing, planing and polishing, or planing alone.

NORRIS DIAGONAL PLANER FOR FINISHING AND POLISHING.

planes, tooth planes, scrapers and sand-paper.

The two latter methods involve hard labor, skill, time, and consequently great expense, proportioned to the nicety of the surface obtained, but in all cases great, even when the work is poorly done.

We illustrate herewith a new machine which, while it is one of the best standard surfacers, also does away with the necessity for hand

For surfacing of rough lumber the cylinder is used square across, the polisher disconnected, and the machine used exactly like ordinary planers.

For smooth planing and planing of framed articles, the cylinder is used diagonally, with the appropriate rate of feed.

For planing or polishing of lumber or frame work, the cylinder is used diagonally and sim-

## The Metric System.

[By HENRY G. HANKS.]

The metric system has been accepted by scientific men of all nations, and especially by the chemists. The English are conservative, and long after American chemists and those of other countries had laid aside all other weights and measures in their laboratory operations, the English still clung to the old system; yet, seeing the advantage of decimal divisions, they divided the imperial gallon of seventy thousand grains into decimals, and accepted the grain as the unit of a set of decimal weights, doing this rather than to set aside their prejudices and introduce the French system; but of late years their scientific men as strongly advocate the metric system as their neighbors.

Some system of weights and measures must have been one of the earliest inventions of man advancing in civilization. No sooner did he begin to exchange with his fellow man, than the necessity of some means of measuring quantities began to be felt.

At first common and easily obtained objects were selected as standards, such as "the stone," "the yard," "the foot," "the finger's length," the hand's breadth and at the present day the height of horses is estimated by the number of "hands" required to measure the space.

It is more natural to divide and subdivide the unit of measure or of weight into halves, quarters, eighths and sixteenths, and for this reason the pound was divided into 16 ounces and the foot into 12 inches. It is only men of education who can be induced to use the decimal system.

The idea of making a standard of weights and measures perfect in itself and upon which both weights and measures should be based, is as ancient as history. Philosophers and thoughtful men of every age have seen the advantage of such a standard, but have not agreed as to its character.

An attempt was made to standardize the inch by laying three barleycorns in a line, as we were taught in our early lessons in arithmetic. Such a standard may have satisfied the age in which it originated, but it would hardly meet the views of the present. No person can realize, if they have not given the subject careful study, how difficult it is to find a perfect standard. Let a standard be defined as a space between two points which is unchangeable, and which if lost or destroyed can be reproduced with mathematical accuracy. Take for an example a rod of brass, wood, gold, platinum or any other metal or alloy. Let it be as perfect as the best mechanic can make it. Let it be placed in an engine lathe and the ends perfectly squared by machinery. Assume, also, that a long micrometer screw, with an exceedingly fine thread, moves a needle point which under a microscope marks the end. Imagine on the end of the screw a wheel with ten faces, by means of which the needle point may be placed in any desired position by counting the revolutions of the decimal wheel. Here would seem to be a perfect means of ascertaining the exact length of the standard, and it would also seem that another rod of equal length might be made, but it is not so. In the first place, the rod itself does not remain of the same length. Each change of temperature either lengthens or contracts it, and moreover, the micrometer screw changes also, but as it is not the same metal, the change is not the same. To correct this error, let us always measure the rod in a room of the same temperature. By this device we shall partially succeed, but not wholly, as it is impossible to keep the temperature of a room the same.

Let another example be a pendulum which vibrates once in a second of time. The same difficulty of maintaining the length of the metallic rod of the pendulum arises as in the first example, besides which there are other sources of error, as the state of the barometer, the altitude above the sea-level, and even the difference of latitude and longitude, which errors can scarcely be overcome.

These examples are given to show the difficulty of reaching perfection. Others might be stated, but it will be unnecessary. In seeking this perfection, so much to be desired, the nature of all the metals and alloys has been carefully studied, and the full force of mathematics called into requisition, as will be shown.

It may be thought that such absolute accuracy is unnecessary, but when it is remembered that the standard must be divided and multiplied almost without limit, and that the smallest error becomes enormous in calculating such distances as the diameter of the earth's orbit, it may be understood why scientific men have expended so much time and expense in the search for a perfect standard.

The present unit of measure accepted as the standard, both by England and the United States, is the *yard*. It is said to have originated with King Henry I of England, who ordered a measure to be made which should be the exact length of his arm. The old standard, known as the "ulna," or ancient "ell," had been long in use. This measure had been the length of some other person's arm who is unknown.

This standard has been retained since, and is the identical yard now in use in the United States. By special act of Parliament, in June, 1824, it was made the standard of linear meas-

ure in Great Britain. It was to be reproduced, if lost, by computing the length of a pendulum vibrating seconds in the latitude of London, in a vacuum and at the level of the sea. The standard yard is described in the Parliamentary enactment as the distance between two points in the gold studs on the straight brass bar in the custody of the Clerk of the House of Commons, whereon the words "Standard Yard, 1760," are engraved, said brass rod being maintained at a temperature of 62° F., and it is to be known as the "imperial yard."

The act provides also that one-third of the standard yard shall be a standard foot, and the twelfth of a foot the standard inch; that the pole or perch shall be five and one-half such yards, the furlong 220 such yards and the mile 1,760 such yards.

In 1834 a fire destroyed the Parliament house and with it the standard yard. An attempt was made to restore it by measuring a pendulum, according to act of Parliament on that subject, when it was found that it could not be done with any degree of certainty. A commission was appointed in 1838, which recommended the construction of a new standard yard and four Parliamentary copies from the best authenticated copies that could be obtained. The commission also recommended that the copies should be placed in the custody of officials in different parts of the kingdom. The restored standard was legalized by act of Parliament July 30th, 1855.

The standard of linear measure in the United States is a brass scale 82 inches in length, made for the Coast Survey in 1813 by Fraughton, of London. The temperature, when measured, is 62° Fah. The measure is taken between the 27th and the 63d inches. No Congressional action has ever made it a legal standard.

I believe it is not generally known that the Congress of the United States have passed a law legalizing the French metric system of weights and measures, and I may to-day legally sell you a kilogram of potatoes or a liter of cod liver oil.

The following are the acts bearing on this subject:

*An act to authorize the use of the metric system of weights and measures.*

SEC. 1. Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that from and after the passage of this act, it shall be lawful throughout the United States of America to employ the metric system, and no contract or pleading in any court shall be deemed invalid or liable to objection, because the weights or measures expressed or referred to therein, are weights or measures of the metric system.

SEC. 2. And be it further enacted, that the tables in the schedule hereto annexed shall be recognized in the construction of contracts and in all legal proceedings, as establishing in the terms of the weights and measures now in use in the United States, the equivalent of the weights and measures expressed therein in terms of the metric system, and said tables may be lawfully used for computing, determining and expressing in customary weights and measures, the weights and measures of the metric system.

*An act to enable the Secretary of the Treasury to furnish to each State one set of the standard weights and measures of the metric system.*

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that the Secretary of the Treasury be and is hereby authorized and instructed to furnish each State, to be delivered to the governors thereof, one set of the standard weights and measures of the metric system for the use of the States respectively.

*An act to authorize the use in post-offices of weights of the denomination of grams.*

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, that the Postmaster General be, and he is hereby, authorized and directed to furnish the post-offices exchanging mails with foreign countries, and to such other officers as he may think expedient, postal balances denominated in grams of the metric system, and until otherwise authorized by law, one-half ounce avoirdupois shall be deemed and shall be taken for postal purposes as the equivalent of 15 grams of the metric weight, and so adopted in progression, and the rates of postage shall be applied accordingly.

The French metric system originated during the revolution. Public attention was first called to the chaotic state of weights and measures in France in the year 1790 by Talleyrand. On the eighth day of May, 1790, the government of France sent a formal proposal to England, asking that nation to appoint a committee of scientific men, members of the Royal Society, to meet the same number of members of the Academy of Sciences of France, to determine the length of a pendulum vibrating seconds, in latitude 45°, at the level of the sea, to form the basis of a mutual standard. The English government failing to respond, the French government appointed the following members of the Academy as commissioners: Borda, Lagrange, Monge, Laplace and Condorcet. These savans proposed for the standard the ten-millionth of a quarter of a meridian of the earth. The name proposed for this standard was the meter. They proposed to have all the multiples and subdivisions divided in decimals.

The commission had under consideration during their sessions three standards: length of a pendulum, one-quarter of the equator, and one-quarter of a meridian.

In their report they advised the measurement

of that portion of the meridian extending from Dunkirk to Barcelona, six and one-half degrees north and three degrees south of the parallel of 45°. By reference to a map of Europe it will be seen that this line extends through France in its longest direction and through a small portion of Spain.

It was also proposed that the weight of a cubic decimeter of water at the melting point of ice should be determined and taken as the standard of weight. The report of this commission was made to a committee of 20 of the most scientific men of the age, nine (9) of whom were French and the others of different nationalities. The report was accepted and immediately carried into execution. DeGambre and Mechain were appointed to measure the arc, and the determination of the weight of water was made by Lefevre-Gineau and Fabbini. The measurement was finished in 1796, after much difficulty on account of the revolution. The meter was found to be 39.3707004 English inches.

It was discovered, while experimenting on the weight of water at different temperatures, that it did not attain its maximum density at zero of the centigrade thermometer, which is melting point of ice, but at six degrees higher on the scale. The commissioners, therefore, determined the weight of a cubic decimeter of water at that temperature, calling the weight a kilogram, thus basing a standard of weight on the tenth of the meter. The quantity of water so determined was called liter, which supplied the unit of a measure of capacity. The standards were legally sanctioned Nov. 2d, 1801.

It would naturally be supposed that when such great care had been taken and so much expense incurred that great accuracy might be expected to result, but, strange to say, such was not the case. In 1838, Puissant, who was engaged in making a map of France, announced the discovery of an error in the calculation of the length of the standard meter, equal to the 1-2,590 of the whole, and that the provisional meter, hastily adopted in 1793, from calculations made by Lacaille, was really more correct than that established by the great commission. Subsequent calculations showed that the error was the mean of two greater errors which had escaped the notice of the commission.

Prof. Miller, of Cambridge, has shown that the weight of a standard kilogram is less than that of a liter of water at its maximum density, having been calculated before the maximum density had been determined with accuracy. After much discussion, it has been decided to adopt the standard meter before mentioned in the archives of Paris, until the errors of former calculations could be corrected. The length of the standard meter is to be taken at the freezing point of water, and the copies to be furnished to foreign nations are to be platinum mixed with iridium. Each meter is to be furnished with a delicate thermometer and all the divisions are to be made by a ruling engine in the most perfect manner.

As far as we are concerned, the metric system is perfect, although the standard is not so. By perfection, I would be understood to mean practical perfection, or if this is a misnomer, I can at least say that the system is better than any other known system, and I doubt if it can be improved.

One of the greatest advantages of the metric system is the facility with which weights and measures can be reproduced and, in case of necessity, can be improvised, as will be shown.

It has been urged as an objection to the introduction of the metric system, that its adoption would render useless all the scales, weights and measures and a great part of the literature now in use. The same may be said of the new system of notation in chemistry. Yet nothing is more certain than that the new will eventually supplant the old. I hardly think that the warmest advocate of the metric system would propose to compel the instantaneous adoption of the new system of weights and measures, but, by showing its advantages, would encourage its gradual introduction. If every photographer would accept this system in his laboratory operations and in his calculations, as the chemists have done, he would be greatly benefited.

The multiples and sub-divisions of the meter are in decimals. The names of the multiples are derived from the Greek numerals, while those of the sub-divisions are of Latin origin.

The measures of length are the meter; the decimeter = 10 meters; the hectometer = 100 meters; the kilometer = 1,000 meters; the myriameter = 10,000 meters; the decimeter = 10th of a meter = 0.10; the centimeter = 100th of a meter = 0.01; the millimeter = 1,000th of a meter = 0.001.

The measures of the surface are: centiare, 1 square meter; are, 100 square meters; hectare, 10,000 square meters.

The measures of capacity are: the liter, 1 cubic decimeter; the decaliter, 10 liters; the hectoliter, 100 liters; the kiloliter, 1,000 liters.

This measure is also called the stère, and is used in France for measuring bulky articles, as for example, fire-wood.

The liter is sub-divided into the deciliter = 1-10th of a liter; the centiliter = 1-100th of a liter; the milliliter = 1-1,000th of a liter.

In practice some of these divisions are set aside, as for instance, in speaking of the sub-divisions of the liter it is customary to say so many cubic centimeters, each of which is the 1-1,000th of a liter. Three centiliters would be written 300 cubic centimeters, or 300 C. C.

In speaking of great quantities it is usual to speak of the number of hectoliters. So also in

using the weights. In usual operations we calculate in grams and milligrams, and in dealing with larger quantities the kilogram and decimals are taken. Any computation made in grams can be stated in kilograms simply by moving the decimal point and vice versa.

In almost all scientific work tables will be found for converting all other weights into the French system. They are easy to understand and simple in application. The best that I know of were calculated to accompany the acts of Congress quoted in the first part of this paper. They may be found in the Smithsonian Report for the year 1865. I would advise all who are specially interested in this subject to obtain this volume for reference. If time would allow I would explain the use of these tables, but I think no person would find any difficulty in applying them after a little study.

## Preparing to Work Flue Dust.

We paid a visit to the Lemmon mill yesterday afternoon and by the courtesy of Mr. Clark, were shown through the institution. The mill was built a number of years ago, for the purpose of reducing the free ores in this vicinity, but for some reason, probably because it failed to pay, has been idle for a long time. Messrs. Clark & Wallace effected a lease of the mill about a month ago, and since that time have been busily engaged in renovating and repairing the machinery, and getting it in order to work the flue dust purchased by them of the Consolidated company. We have given an account of the discovery of the process by Messrs. Clark & Wallace and the wonderful results obtained in experiments at Salt Lake. They concluded that the dust could be worked at this point more profitably, saving, as it would, the items of sacking and freight. The Lemmon mill is a dry crusher, provided with a White roasting furnace, a battery of 15 stamps, pans, concentrators, agitators, etc. Several modifications and improvements have been introduced by the lessees, notably in the battery, the speed of the stamps having been increased from 70 to 90 drops per minute, and the drop reduced from nine to six inches. The stamps will not be used in the working of the flue dust, but it is the intention of the owners to crush any free ores that may be offered to them. A large bin at the rear end of the mill receives the dust and conveys it to the drying floor, where all of the moisture is evaporated. It is then received in a sheet-iron receptacle, where it is mixed with salt and conveyed to a series of belts that carry it to the hopper over the furnace. As above stated, the roaster is of the White pattern, a system that is generally used in Nevada county, California. It would occupy too much space to attempt to give the workings of the furnace; suffice it to say that by the time the charge reaches the delivery floor it is thoroughly roasted and ready for the pan amalgamation. The pans in the mill are of the Horn pattern, and are not adapted to give the best results, but will be used for the present. Their concentrators are also old-fashioned but their defects will be remedied by careful manipulation. Larger pulley blocks have been placed on this part of the shafting, increasing the speed of the millers. The engine has been overhauled and put in good order, and also the retorts. The old swimming bath south of the mill has been repaired and will be used as a source of water supply for the present. The tank on the hill has been caked and the pumps were at work yesterday filling it. Negotiations are pending with Major McCoy, looking to the extension of the main to the mill tank on the hillside. The mill will start up on Monday for a permanent run. Messrs. Clark & Wallace are not given to boasting, but it is easy to see by their actions that they are convinced of the future success of their enterprise—a good fortune that we heartily wish them. The town, as well as the owners, will benefit by the profitable workings of the dust. —*Eureka Sentinel*.

**HUNTER DISTRICT.**—We learn from C. L. Broy, who has just returned from Hunter district, the following facts in regard to that flourishing locality: A number of promising mines are being worked, among the principal of which are the Vulcan and Crown Point, both owned by the Hunter company. At the Vulcan the company have erected hoisting works and the machinery is nearly set. The main shaft has been sunk to a depth of 300 feet. The mine is developing well and some very high grade ore has been met with in the various drifts and levels. There is about 300 tons of ore on the dump awaiting reduction. They have let a contract for a large amount of coal to be used in the company's works. The works will be supplied with water from a large spring, some three miles distant, and will be brought in as soon as the pipe, which is now on the road, arrives. The furnace for the reduction of the company's ore is in course of construction and will be finished and running in six weeks from the present date. The furnaces are situated about a mile from the mine, and the ore will be hauled by teams that distance. The company's affairs are intelligently directed by Ellsworth Daggett, a thoroughly competent Superintendent. Quite a camp has sprung up in the district, some 40 houses having been built, including two stores, one lively stable, three restaurants, six saloons and two lodging houses. Gilmer & Salisbury contemplate establishing a stage route from the town to Toano, the nearest point on the C. P. R. R. The prospects of the district are very flattering. —*Eureka Sentinel*.

## MECHANICAL PROGRESS.

## Returning to Wood for Safety.

It is not a little interesting to note that inventors of impenetrable war vessels are turning their attention from iron back again to the material of the raft, the canoe and the merchantman. We read in an English exchange of the unsinkable vessel of war proposed by Mr. W. M. Pollexfen. The principle of the invention can be very briefly explained; it consists in making the ship as near as practicable a solid mass of timber, the only deviation from solidity being the construction of an impregnable compartment in the center for carrying the armament and machinery. The rectangular bold or space is, of course, arranged to be of suitable size, and Mr. Pollexfen even proposes to provide that the ship shall continue to float although the reserved compartment shall be completely filled with water, and still have buoyancy to spare. He points out that such a ship would be invincible, for though completely swamped and the engine or other rooms flooded for a time, she could be managed with her sails and remain as formidable as any sailing war vessel until her damage was repaired. But this is not all; the whole of the exposed portion of the hull being constructed of solid timbers, Mr. Pollexfen suggests, with much show of plausibility, that not even a torpedo would disable his ship, since the most it would in all probability do is to rend away, without detaching, one or two of the outside timbers, so that no less than a whole succession of torpedo attacks would render the vessel unseaworthy. He remarks that timber can be prepared so as to resist fire to a great extent, and if this preparation were found to interfere with the required weight of the timber in any particular instance, another method can be resorted to—that of rendering the exposed timbers fireproof.

## Progress in Pacific Coast Lumbering.

Year by year, says a writer in the *Post*, the lumber industry of the Pacific coast is growing in larger and larger proportions, and until recently the demand has increased in like proportion. The lumber which is shipped to San Francisco from Puget sound consists in the main of Oregon pine, although there is a good deal of spruce, rough and dressed, some rough cedar and some maple. The redwood comes from California ports. Just at present lumber enters our port from the south, Crescent City, Coos bay, the Columbia river and all along the coast to Victoria. The rapid increase in the lumber trade within the past few years will be seen by the following figures, kindly furnished to the writer by Mr. Earle, of the Lumber Exchange: In 1874 there was received in San Francisco 139,856,486 feet of Oregon pine, 11,866,163 feet of rough spruce, 765,690 feet of dressed spruce, 3,444,343 feet of rough cedar, 188,856 feet of maple and 1,019,646 feet of redwood. In addition there was received some 10,000,000 feet in all of rough sugar pine pickets, railroad ties and telegraph poles, making in all a grand total of 253,250,564 feet. In 1875 we received 163,695,426 feet of Oregon pine, an increase of 23,836,940 feet over the previous year. The increased production in the other kinds of lumber was in nearly the same ratio, and the total increase was equal to 53,073,634 feet. In the year 1876 the total number of feet received reached 309,159,972, equal to 2,835,774 feet over the amount received in 1875. As showing how rapidly lumber is coming into the market, it may be mentioned that last month no less than 31,073,203 feet was received, against 23,610,423 feet in June of last year. The average for the month of June for the past five years has been 22,000,000 to 25,000,000 feet. The July of 1876 was a remarkable month, about 33,000,000 feet having been discharged. The estimate for the present July is about 25,000,000 feet.

## Welding Wire.

In manufacturing guides for coal and other pits, colliery ropes, telegraph wire, telegraph cables and fencing, and in other manufactures, it is often necessary in order to obtain wires of the required length to join two or more lengths of wire together, end to end, and this is ordinarily done by the process of welding. But in welding together wire of iron or steel the metal is frequently so injured during the welding process that the junction formed is very weak, and the wire is liable to break at the welded part. The object of the invention of Mr. W. Hibell, of Birmingham, as described in the *London Mining Journal*, is to produce wires of iron and steel of any required length, having at the joined part a strength equal to any other part. He cuts away a portion of the end of each wire, so as to give it a semi-cylindrical figure, the said cut-away portion extending about one inch from the end of the wire. The extreme ends of the wires may terminate in planes at right angles to the axis of the wire, but he prefers to incline each end so as to give it a wedge shape, the thin end of the wedge terminating in the axis of the wire. When he thus inclines the ends of the wire, he makes the shoulders terminating the cut-away parts of an under-cut figure, so that the wedge-shaped end of one wire when the ends of the two wires are fitted together shall engage with the under-cut shoulder of the other wire. The ends of the wires thus shaped he connects together by the process of brazing or

hard soldering, and the junction formed has a strength equal to that of any other portion of the wire. In wires of small diameter he prefers to give to the ends to be joined an inclined figure simply—that is, he cuts or otherwise forms on each of the ends to be joined a plane, making but a small angle with the plane in which the axis of the wire is situated. The two plane inclined ends are joined by hard soldering or brazing.

## Measuring Cylinders.

Experts in the machine shop, says the *Manufacturer and Builder*, commence to see that the common way of measuring circular cylinders, such as shafts, by means of callipers, is very inaccurate. Different individuals will always find different dimensions, because they judge by the feeling of resistance when the points of the callipers pass over the diameter; and this is the most uncertain of all impressions. The touch may be more accurate than the eye when passing the hand over a level surface to find inequalities escaping the eye, but in case of the use of callipers this sense is not so reliable. The eye is much more so, and therefore it is better to measure cylinders by passing a flattened wire around them (copper is best, as it adapts itself to the curvature better than steel.) Make marks where the two ends overlap, and then measure the distance of the marks to find the circumference, which being more than three times the diameter, will for this reason alone have a chance to be more than three times as correct, even if the more accurate eyeght did not supersede the touch with the callipers.

This of course applies only to large cylinders; for small ones the measuring of the circumference would be very inconvenient and impractical for those of the diameter of an inch or less; then of course a good gauge plate is the thing needed, and universally used, being much more reliable than mere measuring of the diameter.

THE WORLD'S MACHINERY.—The effect of machinery upon the industrial interests of the world generally, is a subject that frequently engages the attention of the economist. In this connection the following estimates of the labor-saving effects of steam motive-power, made by Dr. Engel, the head of the statistical bureau at Berlin, Germany, will be interesting. According to Dr. Engel, as noted by the *Polytechnic Review*, the aggregate steam motive-power at present in use in the world is 3,500,000 horsepower, employed in stationary engines, and 10,000,000 horsepower in locomotive engines, making a total of 13,500,000 horsepower. This force is maintained without the use of animal food, except by the miners who dig the coal and provide the fuel, and the force maintained in the muscles is to the force generated by the product labor as about one to 1,000. This steam-power is equal to the working force of 25,000,000 horses, and one horse consumes three times as much food as one man. The steam-power, therefore, is equivalent to the saving of food for 75,000,000 human beings. Again, three power-looms, attended by one man, produce daily 78 pieces of cotton fabric against four pieces produced by one hand-loom worked by one man in the year 1800. Again, a carpenter's planing machine does the work of 20 men. This, of course, is but the merest outline of what is accomplished by the use of steam-power and labor-saving machinery.

NEW LOCK FOR FREIGHT CARS.—Railways have been not a little troubled by tramps and thieves entering freight cars while attached to trains or while standing on sidings. We read in the *Utica, New York, Observer* that Mr. E. F. Hotchkiss, acting upon a hint of Superintendent Priest, has got up a lock for the freight car which promises to prove very effectual. The lock does not show on the car, because it is under. It cannot be reached when the car is in motion, and when the car is at a standstill in the yard it would be dangerous to go under to unlock it unless with a certainty that the car would not be moved. The lock is operated by a wrench and left-hand screw, which acts as a key and starts an inch bolt of iron which fastens both doors securely. The lock can be easily applied to railroad trains. This lock seems to be a settler on the thieves, inasmuch as it has been their practice to break off the common locks and then enter the car—all this while the car was in motion. This lock they cannot get at. The lock is now on trial on a car running between Utica and Albany. When it first arrived in Albany no directions as to opening it had been received, having miscarried. The freight-house men went to work with a bar and sledge to open it. They succeeded in forcing the door back but five inches, and gave up the task as a bad job.

LOCOMOTIVE FIRE-BOXES.—On the form and proportion of the fire-boxes, the committee of the Master Mechanics' Association recommend no changes excepting to suggest an increase in the number or length of tubes. With the present form of construction of locomotives, any material change in the boiler is impossible, but the question is now being considered by many persons whether some very material changes in the plan of constructing engines are not desirable, in order to get a larger boiler and especially a larger fire-box. When locomotives did not exceed from 20 to 28 tons in weight, the available width between the frames was quite sufficient for the fire-box, but with the rapid increase in size of engines from 30 up to 36 and 38 tons weight, the case is quite different,

## SCIENTIFIC PROGRESS.

## Catastrophism.

Mr. Clarence King is the author of the scientific sensation of the year. For the subject of his address before the alumni of the Sheffield scientific school at New Haven, Conn., he chose "Catastrophism, or the Evolution of Environment." In his geological researches Mr. King has found disturbances which can apparently be accounted for only upon the ground of catastrophe or complete overturning of existing conditions. Thus he brings himself at direct issue with the evolutionists, who put continued, gradual and uniform growth and change at the basis of their theories of development. Mr. King's address was very long. We can but note a few of the points made. He first established the reality of physical disturbances at several epochs in the history of the Cordilleras region, which has been his field of labor. Between the catastrophes intervened the long periods of quiet action, such as is claimed for universal time by the uniformitarians. The same amount of energy would be required to elevate mountainous districts upon either view. The effects of the cataclysms upon life are claimed to be partly extermination; partly destruction of biological equilibrium, thus violating natural selection; and partly the production of morphological changes in plastic species. Marked changes of species are noted in connection with these catastrophes. An illustration is afforded by the supposed genealogy of the American horse, as set forth by Huxley and Marsh, and regarded as demonstration of evolution, or the descent of the several genera from each other. King asserts that in the Cordilleras country, where these relics occur, there has been a catastrophe intervening between each two successive forms of the horse.

After criticizing the opinions of Huxley, Lyell, Hutton, Darwin, and others, he recurred to the effects of sudden terrestrial or cosmical changes, and conceived that the effects of these changes would be, first, extermination; secondly, destruction of the biological equilibrium; and thirdly, rapid morphological change on the part of plastic species. When catastrophic change burst in upon the ages of uniformity, and sounded in the ears of every living thing the words "change or die!" plasticity became the sole principle of salvation. And plasticity is the key to survival and prosperity. Mr. King remarked in conclusion of his address: "He who brought to bear that mysterious energy we call life upon primeval matter bestowed at the same time a power of development by change, arranging that the interaction of energy and matter, which make up environment should, from time to time, burst in upon the current of life and sweep it onward and upward to ever higher and better manifestations. Moments of great catastrophe, thus translated into the language of life, become moments of creation, when out of plastic organisms something newer and nobler is called into being."

A TRULY ARTIFICIAL EYE.—Dr. William Siemens has constructed, by an ingenious adaptation of selenium to the purpose, an artificial eye that is sensitive to light and to difference in color, which gives signs of fatigue when it is submitted to the prolonged action of light, and regains its strength after resting with closed lids, and which by an electro-magnet attachment may be made to close itself involuntarily, as does the human eye, on the occurrence of a vivid flash. In its construction a hollow sphere, suitably supported, is provided with two openings, in one of which is placed a converging lens and in the other a selenium plate, the latter in communication with an electric current and galvanometer. The lens being covered with two movable screens, the whole is comparable to an eye, in which the screens represent the lids and the selenium plate the retina. Whenever the screens are removed the galvanometer is seen to deviate and the degree of deviation depends on the color of the light which converges upon the selenium; it is very slight if the light is blue, more if the light is red and still more if white light is transmitted.

TYNDALL'S SWISS COTTAGE.—The *London World* says: "By next season Professor Tyndall will have built himself a mountain home among his beloved peaks and glaciers. The spot he has selected is in the center of a region of unrivaled beauty and interest. From the Bel Alp, hard by the upper valley of the Rhone, and not far from the spot where the Simplon road bends southwards, he will enjoy on the one side a magnificent view of the Matterhorn, the Weisshorn, and Dom, rearing their proud crests above an army of ice peaks; on the other side is the great Aletsch glacier, bounded and fed by the giants of the Bernese Oberland, the snowy axe-edge of the Jungfrau, the savage pinnacle of the Finsteraarhorn, and the great central dome of the Aletschhorn. It was to the summit of the latter magnificent peaks, springing from enormous glaciers, that Professor Tyndall last summer conducted his bride, to the great delight of that lady, whose skill as a cragswoman is a source of infinite pride to her husband."

SIR WILLIAM THOMSON.—The Italian Society of Sciences has awarded Sir William Thomson, of Glasgow, the Matteucci prize for the investigator who has contributed most to the advancement of science during the past year.

## What Underlies Sacramento.

The boring of an artesian well at Sacramento shows the character of the underlying strata. The *Record-Union* says:

After passing through strata of loose sand, gravel, clay, boulders, etc., the tools at a depth of 886 feet struck soapstone, then passed into cemented sand, and at 1,090 feet struck wood, which was met with at intervals until a depth of 1,108 feet was reached. This wood is black, but in a good state of preservation, looks like pine or redwood, and remains solid after exposure to the air. Soapstone followed the cemented sand, and was in turn followed by cemented sand at a depth of 1,160 feet, and the boring tools have been in that substance ever since. The tubing is full of water to within about 50 feet of the surface of the ground. About the time a depth of 1,075 feet was attained gas commenced bubbling up through the water, and one night when a candle was lowered down to look at the water there was quite a little explosion. Last Sunday the hole in the tubing was covered over at the top, leaving an opening in the center through which a piece of half-inch gas pipe was passed. The gas escaping through this pipe was ignited and blazed up to a height of two feet and a half, burning with a bluish flame, but neither when burning nor otherwise did it emit any odor. Monday forenoon the gas would not ignite, but that afternoon it burned freely again. Wood has been found at several depths besides that mentioned above, the lowest being 1,320 feet, when some of the pieces taken out had a coating of cemented sand, showing that the stick of timber from which it was taken was lying in that species of deposit.

A WONDERFUL MUSEUM.—A great advance, as far as effect is concerned, on existing methods of exhibiting the remains of extinct animals has recently been made in Germany. M. Martin, a distinguished naturalist and taxidermist, has organized, near Stuttgart, a most remarkable museum, in which the various species long since extinct are attempted to be reproduced as they appeared during life. The pieces are models constituted according to fossil skeletons in the most celebrated museums of the civilized world. The collection already contains the gigantic saurians of the trias, the ichthyosaurus, the plesiosaurus, the pterodactyl, the cave bear, the dinomys and many others, all reproduced with great skill. M. Martin has, however, lately completed a work which eclipses his previous efforts, and may be regarded as his *chef d'œuvre*. It represents a mammoth of the quaternary epoch, and is formed according to documents furnished by Pallas, and numerous remains of this fossil elephant are to be found in the rich cabinet of natural history in Stuttgart and other collections. The hair is copied from that of the celebrated mammoth found in Siberia. The height of the object is five meters, its length eight meters. It is hollow inside; four posts pass through its legs. The contour of the body is made with bent laths connected by metallic sheeting. The whole is covered with thick papier mache, on which the hair (made with the fibers of a species of Indian palm) is gummed. This fine object has been bought by Prof. Ward for his museum of comparative anatomy in Rochester, N. Y.

THE PANTHER AS A SEED-DISTRIBUTOR.—An English journal says: The many unlikely methods by which the seeds of plants are diffused over land and sea till they at length find a congenial spot for development, form an interesting and curious study. It is well known that bees carry pollen from flower to flower, and thus act not only as sowers of seed, but also as fertilizers for the female plants. A curious instance of this kind has recently been communicated by a well-known scientific man, who states that attached to the skin of a panther recently shot in India were found numerous seeds, each of which had two hooks, manifestly designated to attach themselves to foreign bodies. As the panther moved about it collected the seeds on the skin and carried them about wherever it went; but when it rubbed against the shrubs, it of necessity brushed some off, and thus distributed them. One of the seeds produced a handsome plant, and beautiful clusters of tubular flowers. It was immediately recognized to be the *Martynia diandra*, a plant which, although introduced into England as far back as 1731, has scarcely ever been cultivated, although it has been commented on by botanists.

NORTH AMERICAN ALGÆ.—We find in the *American Journal of Science* the announcement of the appearance of "Algæ Exsiccatae Americæ Borealis; Curantibus W. G. Farlow, C. L. Anderson, D. C. Eaton, Editæ. Fasciculus I. Boston, 1877." Two editors of the volume are of Harvard and Yale and Dr. Anderson will be recognized as a resident of Santa Cruz and a contributor to the *PRESS*. The specimens of Algæ which are thus presented to the public are fifty in number and Dr. Gray pronounces them "all of real interest and many of them new or next to new, at least in collections." Algæ from California have been unobtainable until the present effort made them available.

THE HISTORY OF THE FLAG.—The July number of the *Magazine of American History* (A. S. Barnes & Co.), has for a leading article a careful and exhaustive sketch of "Our National Flag—its History in a Century," by Major-General Schuyler Hamilton, the first historian of the American flag.

## The Forest Hill Divide as a Mining Section.

We have often spoken of the almost limitless deposits of auriferous gravel lying in Placer county, and particularly of the immense formations of this character lying between the north and middle forks of the American river, known as the Forest Hill divide. This ridge, says the *Placer Herald*, varying in width from two to 10 miles, is, from the region of Todd's valley to above the Secret house, a distance of some 20 miles, underlain, in a comparative sense, with one solid bed of washed gravel, and there is not a shovelful of that gravel scarcely but contains more or less gold. Where this ridge has been cut by modern channels the gravel has been washed out, and it is the gold from these deposits mainly that supplied the river beds which remunerated the miners here so liberally in early days. This alone is evidence that the untouched deposits are rich, but if further evidence were wanting we find it in the developments made by the miners, for in not a single instance that we have heard of has this gravel been struck and the opening fitted up for working by the drift process, or for hydraulic mining where more convenient, but it has yielded fair remuneration for the money and labor expended.

"If this is so," says the stranger, "why don't everybody around there go to mining that gravel and get rich; why don't those running off to the Black Hills and to Arizona come here instead, and why don't those who have been putting their money in Washoe wildcats develop these mines where the investment is more sure and where the outlay would tend to build up our own State?"

These queries very naturally suggest themselves to the stranger's mind, and on a clear answer to the same much depends.

In the first place, therefore, the people residing in this part of the country do not all go to mining these gravel deposits because they have not all got the means. To open and fit up either a hydraulic or a drift claim requires large expenditures before a dollar can be realized, and therefore many who see the opportunity and would fain take hold of the work are deterred from doing so for want of capital. There are cases, to be sure, on this same divide, where poor miners have combined together, and doing the work themselves, have succeeded in opening up a mine that has made them rich. There is one case we call to mind, that of Mr. Weske, where the projector, without scarcely any capital but his hands, succeeded in opening up a rich mine in these gravel beds. But the privations and hardships he underwent required pluck that few men possess. Spending all the money he could get hold of he next resorted to credit, and when his money and his credit were both exhausted, he did not quit, as many would have done, but, nourished by lager beer and crackers, he kept digging away until the goal was reached. In a short time after striking gravel he was able to pay off all his debts and have enough left to make him independent. Other local miners have associated their capital, and in this way most of the mines now opened on that divide have been developed, and there are many of them, though few, indeed, to what there might be.

The Hidden Treasure, opened but little more than a year ago, was developed and fitted up by a combination of sturdy, industrious, and enterprising local miners, and, as is proved from its appearance and its monthly clean-ups, it is now one of the best drift claims in California. Numerous are the instances we might refer to to demonstrate the result of local enterprise. These agencies are doing well in their way, they are doing all they have power to do, but when they have done their best the work is trifling compared to the extent of the field that is there inviting enterprise and labor. So much for that.

Now, as to why those running off to the Black Hills and Arizona do not come here, where work is sure and investment comparatively safe, instead of running off to those desert wilds where all is uncertainty and starvation a probability, we cannot answer. The reason to us has always been a profound mystery. It is one of those peculiarities in the manenverings of mankind, which has characterized every age, and for which metaphysicians have never been able to account. For years miners have been leaving California and going thousands of miles for the chance of striking worse diggings than they left. They will continue to do it in spite of the dictates of sense and the teachings of the press, until experience, dear and hard to acquire, convinces them of their error, and then a reaction will take place, and California, that has done so much for mankind, and that still stands with outstretched hands offering golden opportunities to all who will have them on her terms, which are application, enterprise and industry, will get her just dues and again astonish the world with her mineral wealth.

As to why those who have been putting their money in Washoe wildcats do not stop it and turn here for safer investment, is owing largely to that peculiar faculty of human nature which causes man, regardless of the future, to seek excitement rather than stability. So long as the Washoe mines could be made the base of excitement and a fortune could occasionally be made by one out of a thousand dealers in the

stocks of those concerns, men would invest their money in Washoe to the great exclusion of the large fields inviting honest and safe investment at home.

In these conditions, however, a change is taking place. The tendency to run off into wild countries on uncertainties is giving way before the solid attractions that home still holds out to all and the excitement that has attended the development of the Comstock lode is relaxing into sober calculations of actual results.

The speculative world, particularly that part represented for years on California street, San Francisco, is settling down to realities. Most of the operators there made their raise in California mines, and, having done so, rushed off there to invest it, and became, as they imagined, millionaires. For years they have played with the mining hubble, but finally it has hurstled, demonstrating its illy nature, and leaving many who placed their dependence in it much worse off than when they began. The lesson has been a dear one to California capitalists, but let us hope it has been well learned. We believe it has; we believe the moneyed men of our State are beginning to realize that California still offers the safest and most profitable field for investment. We say we believe this because we notice that the boys are "coming back." Those who years ago made money in the mines of California, and who hoped to double it in the twinkling of an eye by investing in wildcat mines away off over the mountains, now see their folly; they have got tired; they are beginning to realize that California is the best mining field yet, and they are beginning to come back. California mines are again coming in demand, capitalists are turning their attention this way for investment. Under these circumstances it is no wonder that the vast gravel beds of the Forest Hill divide should become a favorite field for location and investment.

Under the impulse of the new order of things, a number of locations have recently been made in that region by parties from below, several important purchases of mining property have recently been consummated, by capitalists who propose to change their base of operations from the other side of the mountains to this side, and hundreds of others are turning wistful eyes in that direction.

## Mines of Arizona.

From Mr. Ike Bradshaw, an old experienced miner who came to Arizona in company with his brother, after whom the famous Bradshaw mountain was named, and John Tatman, the *Arizona Miner* has elicited the following reliable information in regard to their mining prospects and future outlook:

The King, in Pinal county, owned by Barney & Regan, is down 180 feet, and a large mass of ore, the same as that found on the surface, continues to exist, which averages, good and bad, \$600 to the ton. Concentration works are being erected for the reduction of the King ore preparatory to shipping the same to San Francisco. The real worth of this mine is hard to determine, but enough is in sight at present to justify the assertion that it runs into the millions.

Again, on the South King three shafts have been sunk to a depth of 90 feet, each displaying a ledge of well defined properties, and the ore equal to that of the original King.

Thirty-two miles northeast from the King is situated the Glohe district, which contains many leads of wonderful richness. Probably first among these might be mentioned the McMullen, which is being worked successfully in a five-stamp mill which has been erected at the mine. They have a shaft on this lead 60 feet deep, and the ore is of a character that would dazzle the eyes of even old timers who are used to all kinds of mining. Glohe City is here located and has a population of some 200 souls, contains stores, saloons, livery-stables, etc., and is, take it all in all, quite a lively town.

Ten miles further north and east is the Richland Basin, where the noted McMorris lead exists, which is paying all the way from \$1,000 to \$14,000 per ton. The lead is two and one-half feet wide with well defined walls, and has every indication of being a permanent lead. The owners are now in San Francisco with several tons of the richest ore, which is believed will pay \$12,000 to the ton.

Cave creek, north from Camp McDowell and south of the Bradshaw, has a large number of gold leads, all of which are being developed. Some have shafts sunk 180 feet deep, and the showing is flattering. Messrs. Hellings & Veil have a good lead in this district, and are about to erect a small mill at their mine.

In Old Bradshaw work is being done on all the leads, and as work progresses the leads show to be of a permanent character and the utmost confidence is felt by the owners that the day is dawning when Bradshaw will become another Comstock. On the Tiger, War Eagle, Lorenzo, Cougar, Eclipse, and the hundreds of other leads work is being prosecuted and much valuable ore is being piled upon the dumps at the different mines, waiting the advent of machinery wherewith to reduce and separate the valuable metal from the valueless rock and dirt.

In the Peck district great activity prevails, and an idle man is looked upon as a kind of curiosity. The Peck mine is acknowledged to be the best so far as discovered in the Territory, and the yield is perfectly astonishing. Thousands upon thousands of dollars are being ship-

ped monthly to California from this grand old mine.

In Turkey Creek district the same interest is being displayed in developing the rich deposits of silver which exist in the Peck district. The time is not far distant when Turkey creek will be turning out hulkion that will undoubtedly astonish some of the non-believers.

Closer at home we have the Zalida, in Lynx Creek district, a comparatively new lead, but one that bids fair to cope with such mines as the Peck, King, Tiger and others. The Miriam is also attracting much attention and is thought to be a true vein and one of great richness. The Cumerland also bids fair to become a good lead. In fact, we cannot turn our eyes in any direction but what they look in the direction of the hills which contain wealth of untold magnitude now being grappled for by the hardy, industrious miner.

## The San Juan Region.

Topographically, says the *Colorado Springs Gazette*, the San Juan country is the region drained by the San Juan river, and consequently lies entirely on the west slope of the main or continental divide. Sometimes, by persons who wish to speak or write exactly, this section is designated as "San Juan proper."

The country known to popular understanding, however, as the San Juan, is something far wider, although its geographical limits are as yet loosely defined. This is because its different districts or sections have been discovered and developed one after another, and discovery and development are going on yet. It includes in this sense the Animas, Eureka, Summit, Lake, Rosita, Uncompahgre, Gunnison, Alamosa and other districts, differently laid out and bounded by different local authorities. It will probably include yet other districts as they take shape and form out of the unbounded hills. It is this vast range of territory, veined with mines and literally inlaid with wealth, which every month is revealing, that is in common acceptance "the San Juan."

Perhaps the description which would present it in clearest and strongest relief to the common mind, would be to define it as the region of the mountain ranges which enclose the magnificent San Luis valley. The San Juan country is literally the silver walls of the San Luis valley and all they hold. Take the well-known mining districts from right to left as they encircle the San Luis—Rosita, Lake, Gunnison, San Miguel, Uncompahgre, Eureka, La Plata, Las Animas, Summit, Alamosa—and you have the San Juan.

This clearly understood, one begins to have an intelligent conception, not only of the vast wealth and the magnificent future of the San Juan, but of the strong position which it holds in itself and in its relation to the surrounding country. It is a State in itself—a rich, fertile valley, with the dark alluvial soil the farmers love, threaded by streams of good water and girded by hills whose crests are covered with forest timber, and whose ribs are veined with copper, iron, coal, silver and gold. It is a region for the farmer, the grazer, the miner, the manufacturer. They can live and do live there now, and each is a market for the others.

Enclosed ranch ranges, one to five miles in length, can be seen near Del Norte. Large farms of hursting crops smile along the Rio Grande, and yet the country is but touched, so vast, so rich, so new it is. Five thousand mines are already located and 5,000 more can be found. Over a million acres of arable farm land is yet open to homestead and pre-emption, and the Government has just planted a new Land Office at Lake City, to facilitate settlement and convenience settlers.

This is the country which the Denver & Rio Grande has entered at Garland and flanked at Canyon. And this is the meaning of the brilliant passage of the *Sangre de Christo* range at La Veta. The silver walls which shut in this empire with ranges of precious stones, also shut out the approach of the rest of the country to it, save by difficult and almost inaccessible passes. These the narrow gauge has mastered and occupied, and to-day she "holds the fort" of San Juan.

**SAIL VS. STEAM.**—Those "old sea dogs" who are never weary of trumpeting their belief that the British navy began a downward and ruinous course with the introduction of steam, may record another triumph. According to information from Bermuda, Her Majesty's wooden sloop *Dryad* (9) is in a pickle with her machinery. It appears that one of the *Dryad's* cylinders has been reduced till it is now less than three-quarters of an inch thick. As a result, the authorized pressure has been brought down to 17 pounds (!), not more than 45 revolutions are to be made, and the vessel is not to get under weigh till steam is up in all four boilers. Here's a pretty kettle of fish, and the *Dryad*, with nine months of sea time to make before she can leave the station! But we are getting used to this sort of thing at home, and no one seems now to care very much how often this or that man-of-war gets out of gear. On a foreign station, however, to say the least, such a contingency may turn out an awkward mess. On the other hand, if we may judge by what appears to be a pretty general feeling, the crew immediately concerned will rather prefer the change, for it is not too much to say that the objection to ironclads and steam power is pretty general with our A. B.'s.—*Iron*.

## Experiments with Tonite.

On Wednesday several interesting experiments were made in a field at Farnley wood, near Messrs. Clayton and Speight's coal-pits, by Mr. T. Dineen, of the firm of Dineen, Son & Co., Leeds, with their new explosive called "tonite." The experiments were undertaken at the request of a number of gentlemen connected with ironworks, iron mines, quarries, coal-pits, etc., and among those present were Mr. Ezra Woodhead, chief manager at Lowmoor ironworks; Mr. Hezekiah Tempest, manager for the same company at Beeston; Mr. S. Robertshaw, chief manager at Farnley ironworks; Mr. Clayton, one of the proprietors of the ground where the experiments were made; Mr. David Nickols, huilder, Leeds; Mr. Wilkinson, Beckett Street colliery; Mr. Henry Birkby, of Wike brickworks; Mr. Briggs and Mr. Topham, Leeds, and others. The object was to show how the explosive could be used in clearing land of trees, stumps and houlder stones, as well as in quarries and ironworks, in breaking up slag, old iron, etc., and to prove its perfect safety in handling, transit, storage and use. The "tonite," or "patent cotton gunpowder," is of a very different nature from dynamite or gun-cotton, and Mr. Dineen claims for it that it will not explode, except when a cap or detonator, specially provided for it, is inserted in a cartridge with a lighted fuse attached. It then explodes with a loud report, but produces no smell, smoke, or poisonous fumes. It contains no nitro-glycerine, nor dangerous compounds of any kind and has no means of igniting within itself. To prove the safety and strength of the powder, Mr. Dineen cut a cartridge in two pieces. On one portion he poured nitric acid, and sulphuric acid, to show that acid would not burn it. With a match he then lighted the portion of the cartridge which he held in his hand, and threw it into a small pool of water, the result being that the flame was at once extinguished.

To show the effect when the proper cap and fuse were attached, he took a cartridge, and having lighted the fuse, threw it into the pool. The spectators retired a short distance, and soon a loud explosion occurred, and the water was sent to a great height. To prove that concussion in transit would not cause the tonite to explode, Mr. Dineen placed a cartridge on a brick and struck it a blow with another brick. He next placed the cartridge on a stone with a fuse attached, and covered it with a small quantity of clay. On being fired the stone was broken into fragments, thus showing the downward power of the explosive. Another proof of the safety of the tonite when no cap and fuse are attached was given by Mr. Dineen, who put two cartridges over a small bag of gunpowder; on being fired the gunpowder exploded, but the only effect upon the tonite was to ignite it. Cartridges were also placed under the stumps of trees, and these were shivered into fragments. Seven cartridges were then placed beneath a stone which weighed between two and three tons, and the result of the explosion was to break the stone into a great many small pieces. Another large stone was fired from the top, with only a little clay over the cartridge, and the result was the same. A piece of an iron rail was then brought forward. It was two feet by four inches by two inches, and weighed 36 pounds. A cartridge having been placed beside it and fired, the rail was broken into four large pieces, in addition to many smaller ones. At the close of the experiments, when many people had left the ground, Mr. Robertshaw and Mr. Tempest expressed a desire to have the tonite tried on a piece of rail made from the best Yorkshire iron manufactured at the Farnley works. Accordingly a piece of rail was brought which measured six feet by four inches by two inches. In the first shot three cartridges were applied, and on being fired the rail was completely fractured. A single cartridge was then applied to one of the broken pieces, measuring two feet six inches in length, and the result was that the rail was splintered and scattered. The gentlemen present expressed themselves as entirely satisfied with the experiments.—*Leeds Mercury*.

**TURNING OUT RICH.**—The new quartz ledge which was recently discovered, and is now being worked by Beedle & Co., is turning out splendidly. Last week they took out six and a quarter tons of rock and had it crushed at Church's Gold Run mill. On Saturday evening last they got returns from the crushing, which was \$600, besides \$150 worth of specimens. The rock in sight presents the same appearance as that which has been crushed, and they will take it on as fast as possible. They are down about 20 feet, and have a ledge of about one and a half feet thick. This mine is situated a short distance beyond Geo. Smith's, at the Half Mile house, and near the junction of the Grass Valley and Rough and Ready roads. The discovery of this ledge is a very important one and confirms the belief entertained by many old miners that at some time very rich ledges would be found in that vicinity. Several companies in years past have spent considerable money near the place of the new strike, but failed to find any rock that would justify working. This strike will give a fresh impetus to quartz mining in that part of the town and we would not be surprised before long to hear of richer discoveries than that of Beedle & Co. being made. Prospecting has got another fresh start here and a great many men are out on the hills in search of ledges.—*Nevada Transcript*.

## The Metallurgy of Tellurium Ores.

It is evident that during the last six months much has been done in the tellurated mines of Colorado. This noted belt of veins has been the source of much trouble to miners and mill men, and has been the grave of much money. In spite of the numerous failures which accompanied its early development, work on a large number of mines has been vigorously prosecuted, and to-day the district contains at least a dozen fine properties about whose intrinsic value there can be no doubt whatever.

We desire to refer, however, more particularly to the efforts that have been made to beneficiate the ore. An entirely new product (to the Colorado minor), was quickly found that it would not be amalgamated, could be roasted only with great danger, and was exceedingly difficult to concentrate without heavy loss. The extreme richness of the higher grades rendered experiments very costly, while the lower grades, owing to the extreme discrimination of the telluride minerals, were exceedingly difficult to handle. But one process succeeded invariably, viz.: the smelting process at Black Hawk and Golden. By reason of the diversified products bought and treated, these works were enabled to overcome the peculiarities of the telluride ores by mixing small quantities with large amounts of other material.

No other works in the State were in such a position, and, as the prize sought was one well worth struggling for, the processes invented and patented for specially treating tellurides have been almost innumerable. Large amounts of money have been sunk in mills recklessly planned and too hastily erected. The amount of absolute folly shown in these endeavors surpasses belief, and it is to be regretted that there is still much of this going on. But a discussion of this point is not at present intended. We desire to state the present condition of Colorado beneficiation works handling exclusively these telluride ores, and to give a brief description of the mineral found and its peculiarities.

The telluride belt lies in northern Colorado. It traverses the divide between Left Hand and Boulder creeks, and extends to the north and south of each for a distance of seven miles. Its width is about four miles. Within these limits there are many hundred veins located; many thousand in fact, the great majority of which carry tellurated ores to a more or less extent. The ore occurs as telluride of gold, silver, lead and mercury. In a number of notable instances pockets or chimneys of exceedingly rich mineral have been found, but in most cases the tellurides are disseminated in minute particles through the vein, so that the ore seam taken out in bulk would not yield over \$30 per ton. Peculiarities in the condition of the mineral have been found in different veins. In some cases high crystallization predominates; in others this state is almost wholly absent. A peculiarity has also been noticed in some varieties comparable to the "rusty" condition in gold. Concerning this last but little is known. In fact, there is still more of conjecture than knowledge in the entire question, and we can hope for but little light regarding these rare ores until a careful and exhaustive study of these chemical peculiarities is made.

It has been demonstrated, however, that it is unsafe, as well as unscientific, to roast telluride ores alone. This being the case, amalgamation, lixiviation and chlorination are wholly inapplicable. As smelting is the only system of reduction left, and as that is wholly impossible with low grade ores, it was thought by many last year that there was no salvation for the mines unless a new discovery in chemistry occurred. This belief did much towards supporting the numerous patent processes which have of late come to the front, and in a measure excuses much of the credulity with which such absurdities as the Brett and Kindred processes have been received.

Lately, however, and none too soon for the welfare of these mines, attention has been drawn to concentration, and the results, after at least six months of test, have been so favorable that there can be no doubt that this branch of metallurgy offers a correct solution of the entire question. We are not to be understood to say that nothing is left to be desired, for that would be giving too much credit to a system which is at best but auxiliary, but for the present there is one point fully decided. It is possible to work almost all tellurides having a value when raw as low as \$20 per ton. We qualify this statement because there are yet several veins in this belt of mines which have not been successfully handled by concentration machines.

Success, however, has only as yet been accomplished by one machine, the Frue vanner. There are now 12 of these machines in operation in Boulder county on telluride ore, and so complete has been their success that more concentrate is being shipped from the telluride belt than high-grade ore. In other words, these vanners have rendered available already such a large quantity of low-grade ore that the product from these is already larger than that direct from the mines. These concentrates are selling at valuations of \$300 a ton and upwards to \$3,000.

It appears, therefore, that, though the tellurated minerals of Colorado must still be smelted, the great bulk of these ores which have hitherto been regarded as nearly, if not wholly, unavailable, have already become of more worth to the miner than the marvelously rich pockets which have been and still are being

found. It may fairly be claimed, therefore, that a tremendous stride in advance has been taken. And that there no longer exists that element of uncertainty in handling this class of mines which has heretofore retarded investments and discouraged miners.—*Cor. Engineering and Mining Journal.*

## USEFUL INFORMATION.

## Sand for Foundations and Other Supports.

Contrary to the popular notion, sharp sand is an excellent material to support heavy weights, as the mutual friction of the particles prevents any pressure applied on the top from being transmitted sideways, as is the case with fluids, and also to a certain extent with quicksand, which is simply sand containing too much water. The *Manufacturer and Builder* notes that it is sufficient to inclose sand in a cylindrical thin wooden or iron box, and if well shaken down, it will support very heavy weights, which must be placed in the sand alone, and not touch the walls. A box filled with sand is an excellent support for anvils, or for any work where heavy blows or pressure is to be resisted, as sand will sustain much greater weights and resist stronger blows than any solid block of wood of the same size. Another objection to wooden supports is the sound and jar they communicate to the floor on which they rest; for this reason jewelers and others who work on anvils placed in upper stories, place their anvils on cushions, gaining in this way a double advantage—not only stopping the jar and noise, but also making the blow of the hammer more effective. Any observing person of some practical experience must have noticed that the effect of a blow given on a stone or a piece of ice is quite different when we lay it on a hard support from that when we keep it in the sand; in the first case, the stone or piece of ice transmits the blow to the support; in the second case, it receives all the effect itself. Even thus the anvil, placed on a wooden floor or beam, will transmit the blow to the floor or beam, and cause a sound and jar; while when placed on a cushion or on sand, the effect of the blow will be concentrated on the anvil, and the effect of the blows will be comparatively noiseless.

Architects have long known how good a foundation sand is as a support for heavy columns and walls; and as an illustration we may point to the Cooper Institute in New York, the walls of which, and the many iron columns in the large basement hall, have nothing but sand for a foundation, notwithstanding they support the heavy masonry interior walls and iron beams of this fire-proof structure, 100 feet high above the street. This building has now stood some 20 years and no settling of any consequence has been perceived.

**CLASSIFICATION OF LOCOMOTIVE ENGINEERS.**—The following order, containing information which our railroad readers may be interested in, dated July 1st, is issued over the signature of James Sedgley, General Master Mechanic of the Lake Shore railway: "On and after July 1st the classes enumerated below will be established for men promoted upon locomotives. Promotions will hereafter be made from lower to higher classes, if found worthy, upon completion of the service here specified. The fifth class, consisting of engineers promoted from firemen to switching engines, to run 30,000 miles before further promotion. Rate of wages \$2 per day. The fourth class, consisting of engineers promoted from the fifth class, to run in this class until promoted to road service, rate of wages to be \$2.16 per day. The third class consisting of engineers promoted from the fourth class, or switching to road service, to run 40,000 miles before advancement. Rate of wages to be two and one-quarter cents per mile. The second class, consisting of engineers promoted from the third class, to run 50,000 miles before advancement. Rate of wages, two and seven-tenths cents per mile. On the completion of these services they will be promoted to the first class. Rate of wages, 3.15 cents per mile. For superior merit, Division Master Mechanics may advance men from the lower classes to higher before the completion of the whole service specified, reporting such promotion to the General Master Mechanic."

**NEW SOAP-MAKING PROCESS.**—Soap, says the *Manufacturer and Builder*, may be made without caustic soda and without quicklime, by making use of the property of ammonia to combine readily with fat, and to make a very soluble soap, and of soda soap to be insoluble in water if this contains only the small quantity of more than one-half of one per cent. of salt. If therefore, grease, fat or resin, which are commonly employed to make soap, are heated with an excess of common salt, ammonia and water, a soda soap separates, leaving chloride of ammonia in the liquor, together with the excess of ammonia and salt. The ammonia at first unites with fatty acids, and forms a very soluble ammonia soap; then the sodium in the salt exchanges places with the ammonia in the soap, forming a soda soap and chloride of ammonia. It is essential that there be an excess of ammonia and salt present in order that the reaction shall take place. One hundred parts of grease require from 15 to 20 parts of ammonia, 20 to 30 parts of salt, and 200 to 300 parts of water.

## Hints to Carriage Painters.

The *Carriage Monthly* gives some suggestions on painting, from which we take some notes on priming: Never prime a piece of wood, especially hard wood, unless certain there is no moisture in it. Run all wheels out in the sun, or dry by artificial heat before priming, and if painted as described in hurried work, they will not scale, crack or blister. Use more or less oil, according to the time required for finishing; on slow work oil will take the place of varnish. Do not put on one coat and let it stand a long time without sanding, and never put a thick coat on bone dry work. A job painted in this way, with an extra coat of rubbing varnish, allowed to stand a week or more, then rubbed out and well varnished, and kept away from mud and water for one month, will hold its gloss equal to oil work, and will not crack nor have the small-pox and come off generally. If necessary to hurry it still more, use more japan and varnish and less oil, thinning well with turpentine.

Do not put a dry, flat coat on glossy oil, nor vice versa. Be sure your job is free from moisture, so that it will drink in the priming. Make your priming thin enough with turpentine, so that it is drink and not victuals. Make each coat as near like the last as possible, put them on as soon as dry, and they will form one solid coating; then if you have time, let them thoroughly dry before varnishing. For wood work to keep in stock a long time, prime with best pale lead, boiled oil and a little turpentine.

**PETROLEUM AS FUEL FOR SHIPS.**—The neighborhood of the naphtha springs of Borkon has suggested the idea of using mineral oil as fuel for the Russian flotilla stationed in the Caspian. It is more than a year since the first experiments were tried, and a steamer, a schooner and a gun-boat are already heated by this means. The result has proved so satisfactory that the boilers of four other vessels are being altered to adapt them to the new system; and, for the future, naphtha will probably be more extensively used by vessels in the south of Russia.

**A SUGGESTION FOR TRAVELERS.**—The *Railway Age* says: It would be an excellent idea to require passengers at way stations to invariably enter the cars at the front and leave them at the rear end. This would prevent the crushing and struggling that generally attend the stoppage of trains at intermediate stations, by which much time is lost and much bad temper is excited. Notices posted in the cars and a little attention by the trainmen would soon establish the custom as one of the rules of travel, which few would think of violating.

## GOOD HEALTH.

## Heart Disease.

At a late scientific congress at Strasburg, it was reported, that of 66 persons who had suddenly died, an immediate and faithful post mortem showed that only two persons had any heart affection whatever; one sudden death only, in 33, from disease of the heart. Nine out of the 66 died of apoplexy, one out of every seven, while 46, more than two out of three, died of lung affections, half of them of "congestion of the lungs," that is, the lungs were so full of blood they could not work, there was not room for air enough to get in to support life.

It is then of considerable practical interest, says *Hall's Journal*, to know some of the common every-day causes of this "congestion of the lungs," a disease which, the figures above being true, kills three times as many persons at short warning, as apoplexy and heart disease together. Cold feet; tight shoes; tight clothing; costive bowels; sitting still until chilled through after having been warmed up by labor or a long or hasty walk; going too suddenly from a close heated room, as a lounge or listener or speaker, while the body is weakened by continued application or abstinence, or heated by the effort of a long address; these are the fruitful, the very fruitful causes of sudden death in the form of "congestion of the lungs;" but which being falsely reported as "disease of the heart," and regarded as an inevitable event, throws people off their guard, instead of pointing them plainly to the true causes, all of which are avoidable, and very easily so, as a general rule, when the mind has been once intelligently drawn to the subject.

## Phosphatic Food.

The *Manufacturer* has the following plea for special feeding of the brain: Man is being perpetually renewed; the old and used-up particles are removed from the system and their place is supplied with the same element newly presented to the organism. Motion destroys a portion of the integrity of a muscle, sight a something from the retina of the eye, and "thoughts which breathe and words which burn," literally burn and change into another chemical formula a certain portion of the phosphorus of the brain. Hence arises the necessity of supplying the system with an element on which the mental functions depend more than on any other inorganic ingredient. Experience shows that highly phosphatic and easily digested food, such as soft-boiled eggs, boiled fish, the flesh of fowls, oysters and kale food

(phosphorized more than most other grains and vegetables), is especially suitable to persons whose minds are overtaxed by intellectual duties, and in purely nervous affections it is recommended by physicians who understand their business. Very recommendable for this purpose is the liquid acid phosphate, because it contains the phosphorus in a condition in which it is most easily assimilated. The idea of partaking of particular kinds of food or beverages to nourish the nervous system is rapidly gaining ground or theoretically accepted as correct. Said a physician lately to us, with whom we conversed on this subject: "What a fool was I in my ignorance to laugh at the idea of brain food. Why, sir, it is the most valuable one I ever put in practice. I thank you chemists for it."

## Potatoes for Food.

Dr. Hollbrook, editor of the *Herald of Health*, writes the *Dining Room Magazine*: For my own part I am not much of a believer in potatoes, except for those whose labor is largely muscular and in the open air. For such they are valuable. The reason I object to potatoes is because they are composed very largely of starch, and starch is too difficult of digestion for those with only moderate stomach power. In order to serve its purpose in the system it must first be converted into sugar, and this is done first by most thorough chewing, and then by being mixed with plenty of pancreatic juice in the intestines. Not one person in 10,000 chews a potato finely enough to convert its starch into sugar, so much of it passes out of the body undigested, and the body suffers for lack of nourishment. Dyspeptics, nervous people and brain workers should not eat potatoes except in great moderation, and I generally advise them not to eat them at all. They do not contain phosphorus and mineral matter enough for the nerves. They are apt to produce a condition of nervous despondency which is very depressing. I know a person who, after eating heartily of potatoes once or twice, experiences a tendency to commit suicide, which goes away at once after refraining from their use for a day or two. I have advised many invalids to let potatoes alone, and to great advantage. Adding butter to potatoes is a mistake. True, it makes them taste better, but the melting butter covers the starch grain with a coat of oil which prevents the juices of the intestines from getting at it; and as for the gastric juice, it has no influence on starch and cannot digest it. If eaten, they should be eaten with a little salt and pepper, but without butter. The best way to cook them is to boil or bake and serve hot and mealy.

**A NEW VIEW OF CONSUMPTION.**—Dr. F. J. Bancroft, President of the State Board of Health of Colorado, in the first annual report of the board, makes the suggestion that phthisis properly belongs to the class of "filth diseases," and can be controlled and prevented by attention to cleanliness. He supports this view by the fact that tubercle is inoculable, and may enter the body through contaminated drinking water. In Colorado phthisis was unknown until cases from other States brought it there. Now it is found among the native population. "This view," as another writer remarks, "receives very strong support from the history of health resorts in Europe. The time was when phthisis was practically unknown in Madeira, in Naples, in Malta, along the Riviera and the upper Nile. Consumptives flocked there in crowds, and now in all these districts the native population succumb to the disease in quite as large proportion as elsewhere. The practical lesson is that equal care about disinfection and sanitation should be exercised in regard to consumption, as in regard to typhoid or scarlet fever."

**KEEP CISTERNS CLEAN.**—At a recent meeting of the Royal Society of Arts, in Edinburgh, Dr. Stevenson Macadam read a paper on "Sediments in Domestic Water Cisterns," in which he expressed the conviction that in many cases the evil effects of impure water supply were directly traceable to the contamination of the water by its being retained in cisterns containing deposits lying there for lengthened periods. The analyses of a number of sediments taken from cisterns in different parts of Edinburgh and Portobello proved that the deposits were intermingled with minute particles of carbonate of lead, due to the action of the water upon the lead of the cistern, as well as of organic matter, derived in part from the ordinary street or house dust, and in part from insects, etc. Analyses of the water supplied to the city before entering the house cisterns, and of the water which had stood for a week over the deposits or sediments from cisterns, showed that the water had suffered serious contamination. The only way to obviate this is by the periodic cleansing of the cistern; and this should be done at least every three months.

**STIMULANTS USED BY THE RACE.**—The *Quarterly Journal of Inebriety* says: It is estimated that coffee, both beans and leaves, is drunk by 60,000,000 of the human family. Tea of all kinds is used by 500,000,000 and opium by 400,000,000; alcohol, in its various forms, by 500,000,000 of the human race. Tobacco is probably used by 700,000,000 or 800,000,000. These startling facts indicate a large proportion of the race using some substances that are either stimulants or narcotics. The work of the physiologist, in the future, will be to determine the true place in nature of these substances and indicate where their use ends and abuse begins.

## Subscription and Advertising Rates:

ADVERTISING RATES. 1 week. 1 month. 3 mos. 12 mos.  
Per line.....25 .50 \$ 2.00 \$ 5.00  
Half inch (1 square). \$1.00 \$3.00 7.50 24.00  
One inch.....1.50 4.00 12.00 40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Four insertions are rated in a month.  
Subscription in ADVANCE—Postage paid—one year, \$4; six months, \$2.25; three months, \$1.25. Remittances by registered letters or P. O. orders at our risk.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, July 28, 1877.

## TABLE OF CONTENTS.

GENERAL EDITORIALS.—Notices of Recent Patents; The Mechanics Institute Fair; Diagonal Planing and Polishing Machine; Items of Interest from the Mines, 49. The Week; Quicksilver; The Great Strike and its Consequences; The Dead Rivers of Sierra, 66. The Telephone; An English Decision in Favor of the Dynamite Patents, 57. Patents and Inventions, 60.

ILLUSTRATIONS.—Norris Diagonal Planer for Heavy Surfacing; Norris Diagonal Planer for Finishing and Polishing, 49. Prof. Graham Bell's Telephone, 57. MECHANICAL PROGRESS.—Returning to Wood for Safety; Progress in Pacific Coast Lumbering; Welding Wire; Measuring Cylinders; The World's Machinery; New Lock for Freight Cars; Locomotive Fire-Boxes, 51. SCIENTIFIC PROGRESS.—Catastrophism; A Truly Artificial Eye; Tyndall's Swiss Cottage; Sir William Thomson; What Underlies Sacramento; A Wonderful Museum; The Panther as a Seed Distributor; North American Algae; The History of the Flag, 51.

USEFUL INFORMATION.—Sand for Foundations and Other Supports; Classification of Locomotive Engineers; New Soap Making Process; Hints to Carriage Painters; Petroleum as Fuel for Ships; A Suggestion for Teachers, 55.

GOOD HEALTH.—Heart Disease; Phosphatic Food; Potatoes for Food; A New View of Consumption; Keep Cisterns Clean; Stimulants Used by the Race, 55.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 52.

MINING SUMMARY.—From the Various Counties of California, Nevada and Arizona, 53-60.

GENERAL NEWS ITEMS on page 57 and other pages.

MISCELLANEOUS.—The Metric System; Preparing to Work Fine Dust; Hunter District, 50. The Forest Hill Divide as a Mining Section; Mines of Arizona; The San Juan Region; Salt vs. Steam; Experiments with Tonite; Turning out Rich, 54. The Metallurgy of Tellurium Ores, 55. Barometers in Mines; Treating Copper; Red Lead Furnaces; Why Can't it be Found? Massachusetts Hill Mines, 58.

## NEW ADVERTISEMENTS.

The Giant Powder Co., Bandmann, Neilson & Co., S. F.; Manhattan Fire Brick and Clay Refractory Works, Adam Webber, New York; Pacific Lamp and Reflector Factory, Emilie Bosch, S. F.; Works on Assaying, Mineralogy, Etc., Jno. Wiley & Son, New York; Fine Tools and Foot Lathes, Jackson & Taylor, Baltimore, Md.; Tarrant's Seltzer Aperient; Delinquent Sale—Silver Sprout Mining Co.

## The Week.

The past week has been fraught with events of a most exciting nature over a great part of the United States, as well as in California. The great strike, which has grown to the dimensions of an agrarian insurrection, is the topic of the hour. It has spread to all quarters, and as we write (Thursday) shows no appreciable diminution. The existence of mobs, pillaging and burning in many cities, has paralyzed business of all kinds, and affairs generally are in a most unsatisfactory condition. Here in this city a mob of hoodlums are endeavoring to take the law into their hands, and on Wednesday evening an incendiary fire destroyed a hundred thousand dollars' worth of property. The reckless, criminal classes of the community have taken advantage of the strikes of laborers and mechanics to foment disturbance and organize a mob. A vigilance committee—a "Committee of Safety"—has been organized to assist the authorities in quelling the disturbance, and it is to be hoped that the city will be spared any repetition of the disgraceful scenes of Wednesday night. It behooves all law-abiding citizens of every class to aid in suppressing violence and to counsel moderation in such trying times. Even just demands of workmen are not to be carried out by violence and destruction of property; and as the loss in such cases falls on the communities in which it occurs, all good citizens should do their best to suppress lawlessness of any kind. The times are hard enough on this coast now, and it is to be feared that if further riotous demonstrations are indulged in and more property destroyed, business will be almost entirely suspended and hardships brought on all classes of the community.

## Quicksilver.

We gave the other day an article on the depression in the quicksilver trade, and an account of the mines which had shut down on account of the low state of prices in this article. We did not think, however, that any of the larger mines would shut down, but we see it stated that the Redington quicksilver company have concluded to stop four of their furnaces for the usual annual clean-up, and not to start them again after so cleaned up until there shall be a material advance in the price of quicksilver. The Napa Reporter says that they will in the meantime suspend the extraction of ore, deeming it more advisable to preserve in the mine their reserves of ore, rather than extract and reduce at the present very low price of quicksilver. They will continue to run their four fine ore furnaces, of the Livermore patent, on such accumulations of fine ore as they now have on the surface. The result of this partial stoppage will be the reduction of the company's product to something less than half what it has been for the past year.

Even in the best of times quicksilver mining has not been so profitable at all the mines as has been supposed. At the New Almaden for instance, the representative quicksilver mine of the State, the dividends to stockholders from 1864 to 1876, inclusive, were only \$492,950, and the assessments in the same time were \$214,560, making the net amount received by stockholders only \$278,385 in 12 years. The State and county taxes for the same period were alone \$123,662.

The following table from the San Jose Mercury gives the assessed valuation of the several quicksilver mines of the State of California for 1876-77.

Name of Mine.	Land.	Improvement.	Personal Property.	Totals.	Flasks Produced.	per Flask.	Valuation.
Redington.....	41,240	95,000	14,900	151,100	9,183	16.46	
Sulphur Bank.....	56,272	3,200	28,000	84,570	8,732	9.68	
Guadalupe.....	19,910	20,000	10,950	51,750	7,381	7.01	
New Idria.....	50,960	25,000	14,119	90,079	7,272	12.30	
Great Western.....	27,000	20,000	2,615	49,615	4,493	11.04	
Oakland.....	5,000	5,000	1,050	11,050	2,150	5.14	
St. John's.....	20,000	5,000	1,925	26,925	2,085	12.91	
Total.....	220,388	174,182	70,609	465,179	41,298	11.26	
New Almaden.....	150,000	150,000	91,115	391,115	20,631	18.06	

## Assessments, 1877-8.

Redington.....	36,240	80,000	8,875	125,115	.....	.....	.....
Sulphur Bank.....	50,750	63,900	9,235	123,785	.....	.....	.....
Guadalupe.....	23,350	65,500	10,900	100,750	.....	.....	.....
New Idria.....	30,900	20,000	5,385	60,545	.....	.....	.....
Great Western.....	27,000	20,000	2,515	49,515	.....	.....	.....
Oakland.....	5,000	5,000	2,740	12,740	.....	.....	.....
St. John's.....	20,000	5,000	765	25,765	.....	.....	.....
Total.....	196,300	256,300	44,715	497,315	.....	.....	.....
New Almaden.....	150,000	100,000	51,820	301,820	.....	.....	.....

From these figures it will be seen that there is a remarkable lack of stability in the business of quicksilver mining, so much so as to cause it, in insurance parlance, among the extra hazardous risks.

Perhaps one of the strongest proofs of the fluctuations in the value of mines is given by the statistics of the New Almaden mines for 24 years, commencing in 1850. Its total production for the period was 627,002 flasks of quicksilver of 76½ lb each. The greatest number of flasks produced was 47,194, in the year 1865, the least number was 9,084, in 1874. The yield of quicksilver from the ore was an average of 36.74 per cent. in 1850, and an average of only 4.72 per cent. in 1876, thus showing a decline of 32.02 per cent.

The receipts of quicksilver at San Francisco for the first six months of 1877 were 36,955 flasks. For the same period of 1876 they were 27,618 flasks, showing an increase for 1877 of 9,337 flasks. The exports for the same periods show a large increase in number of flasks for 1877, at a largely reduced value. Thus, for first six months of 1877 the exports were 30,224 flasks, valued at \$1,015,574;—average \$33.66 per flask. For the corresponding period of 1876 the exports were 19,102 flasks, valued at \$835,800; average per flask, \$43.75; difference in value, \$10.15 per flask. By which, in striking the balance, we find the increased export of 11,122 flasks realized only \$179,774;—or an average of \$16.16 each, which was probably less than the cost of its production.

BILLION SHIPMENTS.—Since our last issue shipments of hullion from prominent mines have been as follows: Northern Belle, July 17th, \$6,916.36; Consolidated Virginia, 19th, \$249,333.62; total for July account, \$293,923.87; California, 19th, \$124,590.92; total for July account, \$503,931.89; Northern Belle, 15th, \$9,323.60; Modoc, 18th, \$3,911.74; Tybo Consolidated, 17th, \$4,044.46; Modoc, 20th, \$4,230.20; Tybo Consolidated, 10th, \$4,111.80; Endowment, 23d, \$6,119.23; Northern Belle, 19th, \$9,227.35; Modoc, 20th, \$4,230.20; Con. Virginia, 23d, \$210,756.46; total to date, \$504,679.83; Modoc, 22d, \$3,467.90; total to date, \$36,195.62; Arizona, 22d, \$2,136.56; California, 23d, \$184,235.25—total to date, \$688,167.14; Leopard, 24th, \$3,600; Tybo Consolidated, 21st, \$3,395.33; total to date, \$50,270.61; Raymond & Ely, 19th, \$6,432.50.

## The Great Strike and its Consequences.

The events of the past few days have been, perhaps, the most grave and wide spread in their occurrence and consequences of any which have ever taken place in connection with labor strikes. On Monday or Tuesday of last week the telegraph briefly informed us that a somewhat serious strike was in progress on the Baltimore and Ohio railroad, at Martinsburg, in West Virginia. As there is no organized military in that State, and as the trouble became at once of a nature which required forcible resistance entirely beyond the local police force, the President was called upon to use the national authority to suppress the riotous disposition of the strikers. A company of United States troops were promptly sent to Martinsburg, between whom and the strikers a collision occurred which resulted in the killing of one or two of the latter. This act greatly incensed the strikers, who thereupon gathered in still larger force, and by emissaries sent out along the road, from Baltimore to its western terminus, brought about a general strike. From this beginning, as our readers are well aware, the strike has been extended to nearly all the principal roads east of the Mississippi, and from them to a large number of the leading manufacturing establishments throughout the Middle and Western States.

There is no need that we should enter into any detail of the terrible scenes of carnage, fire and bloodshed which have resulted from the little spark first lighted at Martinsburg.

For a time it was hoped that, from the great distance which separated this State from the seat of disturbance in the East, and the total insimilitude of the circumstances surrounding the two localities, no outbreak would take place here. But the events of the past four or five days here show that we have an element in our midst fully as destructive and reckless as can be found in our sister cities of the East. This element is now in a state of most feverish excitement and ferment, and nothing but the most determined stand taken by the law-abiding citizens of San Francisco has thus far been able to keep it measurably under control. As it is, numerous acts of lawlessness and incendiarism have been committed—acts which will no doubt cost the city a large amount of money. Business has also been largely affected since Tuesday. In fact, as we go to press, but little is doing beyond the taking of still more effective measures to put down the riotous spirit which is now abroad in the city.

It is fortunate for San Francisco that such a large part of the middle and poorer classes in the city own their own dwellings, and are personally and pecuniarily interested in maintaining a proper observance of the laws, and in putting down any spirit of rioting at its first appearance. The parties who have thus far been engaged in breaking the law are thoroughly irresponsible persons, and are entirely beyond the sympathy and support of any respectable classes of society.

It is true that, in consequence of several successive dull years, and the present exceptionally dull one, wages on this coast have been somewhat reduced; yet they are much higher than at the East. Moreover, several large operators and employers, who had contemplated still further reductions, have, since the present troubles at the East, promptly announced that no further reductions will be made. Noticeably, in this connection, we may mention the Central Pacific railroad.

It is to be hoped that all good citizens will unite with each other in keeping order and quiet in our midst, and that all causes of agitation or irritation will be avoided, both in personal conversation, and, by all means, in the avoidance of public meetings which may seem to favor or look to any differences of opinion between employers and employed, or which, by implication or any other possibility, might tend to contumacious, initiate, or give impetus to disorderly conduct. We write on Thursday, and we trust that the events of last night may be the worst phase which the present disturbed state of society will fasten upon the history of San Francisco.

On the Constock, according to the News, the principal features of improvement in the mines are more and better ore at the 1000-foot level of the Justice, and in the double winze below the 1650-foot level of the bonanza. The bottom of the winze is now cutting through porphyry horse into the rich ore on the west side, as was prognosticated in our last week's report, and this horse is found to be much narrower than at the 1650-foot level. In all probability it will disappear entirely before reaching the 1750-foot level. The C. & C. shaft has reached the 1850-foot level, sinking amid great difficulty from the great influx of water, the miners working most of the time above their knees in water. In Carson river, on the contrary, there is a perplexing and continued decrease of water, so that milling is suspended to a considerable extent.

The Coroner's jury in the case of Wadsworth, Pennsylvania, mine disaster, where eight miners were killed, state that the mine was run in violation of law. General Pleasant, Chief Engineer; John Bowen, Superintendent; Edward Herbert and William Watkins, bosses, were required to furnish \$5,000 bail and appear for trial.

## The Dead Rivers of Sierra.

Boring with the Artesian Auger—The Eastern Channel.

In no part of California are the Pliocene river beds more numerous than in Sierra county, nor can their courses be anywhere else more easily traced than here. Three principal channels of this kind cross Sierra in a generally north and south direction, the most easterly passing in the vicinity of Gold Lake, the Keystone mine, Milton ranch and thence on in a southerly course by Nebraska and American hill to the extensive grounds of the North Bloomfield company, on the San Juan ridge, in Nevada county. Being deeply covered along its more northerly parts by volcanic outflows, this channel has been there but little worked, the only portions of it that have yet been much opened up being those lying to the south of the Middle Yuba, in Nevada county.

## The Next and Central Channel.

Being separated from the one just described by a space of eight or ten miles, comes in from the north by way of Canyon creek, Deadwood, Fir Gap, Monte Cristo, Forest City, Allegheny, Chipe Flat and Minnesota, in Sierra, continuing thence on by Orleans Flat, Moores Flat, etc., in Nevada county, where it appears to run into and intermingle with the more easterly channel. After passing into Nevada county, this central channel has been successfully worked at several places by the hydraulic process, nearly all the work done elsewhere along it having been carried on through shafts and tunnels, the overlying volcanic masses being here too heavy to admit of hydraulic washing. At all the camps mentioned, as well as at many other points along this channel, the diggings paid enormously in earlier days, and at several places rich claims are still being worked. All that is required, in fact, to get good pay anywhere along it, is to find the main channel and go to bedrock, near which the most of the gold lies. This channel, which, like the others, pursues a devious course and has numerous branches, is about 25 miles long within the limits of Sierra county.

The most westerly of these three channels, known as

## The Slate Creek Basin.

Is separated from the central one by a space varying from four to six miles in width. This channel is double, there being a branch on each side of the basin throughout nearly its whole length. Emerging from under Pilot Peak, an isolated volcanic cone 7,000 feet high, the main channel here pursues its way through a long series of mining towns and camps, of which Hesperidam, Gibsonville, Howland Flat, St. Louis, La Porte, Scale's Diggings and Brandy City, are the principal. Gold gathering is here conducted by both the hydraulic and drift methods, this having for many years been an active and profitable field of operations. In speaking of the gold sent out from La Porte, the central shipping point for this district, the estimates are often made by the ton, there having been transmitted through a single house engaged in the business at that place, considerably over one hundred tons, the transportation through all channels having amounted to more than \$100,000,000. While the surface diggings along this belt have been pretty well exhausted, scarcely any impression has been made upon the deep lying deposits that occupy the ancient river beds and their various branches, which will probably afford profitable work for centuries to come.

Already the channel of Slate creek has become so filled up with debris as to interfere with successful operations in many of the hydraulic claims along it, and in some, to stop washing altogether. With a view to obviating this trouble the Alturas gold mining company, who own something over three miles of this basin with its contents, propose to cut down the rocky barrier at its lower end and run out this vast accumulation of tailings, extracting from them at the same time the large quantities of gold they are known to contain.

In their efforts to reach the auriferous deposits resting in these several channels and their branches, the drift-miners have heretofore met with terrible losses of time and money, innumerable tunnels having been run here on levels too high or too low to properly serve the purposes of gravel extraction and drainage. That so many of the failures should have occurred in this neighborhood has been due to the fact that the old river channels are here covered up to such depths that it was impossible to put down shafts and ascertain their exact levels before commencing the tunnels. Of late these levels have come to be better understood, by reason of which, fewer mistakes of this kind have occurred than formerly.

## A New Method for Ascertaining the Position and Levels of the Old River Beds

Has recently been introduced, which, besides being attended with greater certainty, promises to much diminish the cost as well as the time before required for this purpose. This method consists of artesian boring, a plan first employed by the Pliocene company upon their extensive claim near Forest City, a few months since. The drill is here operated by means of a spring pole, the force used being hand labor, three men on eight-hour shifts sufficing to keep the pole in perpetual motion.

The claim of the Pliocene company, two miles in length, is situated on the middle chan-

nel, which, at this point, has, between the rim-rock indications on the surface, a width of about 3,500 feet, the gold-bearing portion of the channel at the bottom being from 400 to 500 feet wide, and lying about 460 feet beneath the surface. In having recourse to a shaft for prospecting these subterranean repositories, the trouble heretofore has been that its bottom might happen to come upon the high rim rock, leaving the miner in doubt as to which side of the center of the channel it might be on—a point that he would have to determine by drifting. If it were intended to hoist the gravel through it, a shaft so situated could not well be made to answer the purpose. If a tunnel were to be run, then such shaft, being off its line, could not be made available for ventilation.

If the first hole put down with the artesian boror proves to be not in the center or in the gold bearing portion of the channel, another or, if necessary, several others can be sunk in a line across the channel, until the central point is determined, and which being fixed, the shaft is there put down, the object of this boring being to ascertain exactly where the shaft, if it is intended to hoist dirt through it, should be sunk or, if a tunnel is to be put in, the precise point to which it should be run.

In sinking, this company have thus far averaged about 18 feet per day, working eight-hour shifts, with three men in each. They are now down about 200 feet, the work having been comparatively slow, the material penetrated consisting mostly of a hard volcanic lava, with many flinty boulders embedded in it, a sure indication, however, of the presence of a buried river below. Mr. E. S. Thurston, a thoroughly competent mining engineer, who has charge of the work, expects that he will soon reach the heavy sub-stratum of pipe clay, when much more rapid progress will be made, the drill being advanced from 50 to 60 feet every 24 hours.

As soon as the proper point for the shaft has been determined, and this may be accomplished by the first hole bored, the work of putting down the shaft will be commenced and prosecuted with all practicable expedition, it being Mr. Thurston's intention to have this structure completed and his gangways opened ready for taking out gravel during the course of the coming winter. This shaft will have three compartments, two for hoisting and one for pumping. For hoisting purposes, a steam engine, having capacity to do all necessary pumping and bring to the surface 500 carloads of gravel per day, will be provided.

#### Prospective Yield.

The Pliocene claim being on the same channel with that of the Bald Mountain company, one of the most productive in Sierra county, may be expected to yield as well as the latter, as only a single claim intervenes between them. A short distance above them the old channel has been cut by a deep ravine, revealing the lower stratum of the old river bed in all its richness, and establishing almost conclusively that the Pliocene company will have the same in their ground. Should such prove to be the case, it would bring to the company such reward as they well deserve for introducing a mode of prospecting these ancient river beds that promises such substantial advantages over those heretofore employed.

#### The Telephone.

One of the inventor's triumphs which will ever be associated with the coming of the Centennial year, is the transmission of sound by means of electricity. Long ago the telegraph learned to print and afterwards to indicate letters, words and ideas by means of the clatter of mechanism, but it is only about one year since the current of electricity first learned to carry the cadence of the human voice and the harmonies of music. This great step in the application of the electric current to the service of mankind was demonstrated to be possible by Prof. Graham Bell, a native of Scotland, but a resident of this country. His father, Prof. A. M. Bell, and he himself have become known widely as instructors of deaf mutes in a manner of speech. It is related that in one instance Prof. Graham Bell enabled a girl who had never produced an articulate sound to pronounce words distinctly after having her under his tuition for the short space of two months. "If I can make a deaf mute talk," the now famous inventor is reported to have said, "I can make iron talk." Whether he has made iron talk or not may be questioned; and yet it must talk, for it can listen and repeat what is whispered into its ear with the facility of an accomplished gossip.

Last year, when Prof. Bell first brought out his telephone, we made a note of it, and we have also mentioned the improvements which he has introduced from time to time, until it now stands a marvel of inventive success, if one considers the simplicity to which the machine has been brought in the short time since its first announcement. Although it is now a gratifying triumph, it cannot be doubted that there are still directions of improvement in the adaptation of the machine to all conditions through which sound must pass. It is, however, now so perfect as to warrant the public interest which it awakens and the tests of utility which are being placed upon it with a view to its industrial introduction.

About two weeks ago the telephone was

brought to the coast by Geo. S. Ladd, President of the California Electrical Works, and was exhibited to a private company, composed of journalists and others, and representatives of the Press were present. We secured from Mr. S. D. Field, Secretary, a drawing of the instrument, from which the accompanying engraving was prepared. It shows about one-half the actual size of the instrument. This sketch, we think, gives a better idea of the mechanism of the telephone than any we have seen elsewhere.

Speaking generally, first, the telephone consists of three parts; a horse-shoe magnet, around the pole of which are coils of insulated wire, with soft iron cores; in front of these is a diaphragm of thin iron, capable of vibration; in front of this is a funnel-shaped mouth-piece, by which sound is converged upon the vibrating diaphragm. These and the necessary framework to hold them in proper position comprise the chief parts of the instrument. Describing the telephone more accurately, with reference to the engraving:

A is the mouth-piece, through which vibrations of voice are projected against the diaphragm, C.

C is a diaphragm of Russia sheet-iron, circular and about four inches in diameter.

D is a soft iron core, polarized by the magnet, H; N marking the north pole of the magnet.

E is a helix or coil of wire, No. 32 gauge, with about 20 ohms resistance.

G is the wire to the line of telegraph extending to another telephone. F is the wire to the earth. B, J, K, are parts of the wooden frame by which the parts of the instruments are held in juxtaposition.

It will be noticed that our engraving shows the coil upon one pole of the magnet. The

PROF. GRAHAM BELL'S TELEPHONE.

other pole is similarly crested. The whole apparatus is enclosed in a walnut box five inches square and ten inches long, with the mouth-piece projecting through one end of the box.

The following is a condensed statement of the working of the telephone as noted by Mr. Field: A person speaking through the mouth-piece A, throws the diaphragm C into vibration; said vibrations being of greater or lesser intensity as the tones of the voice are higher or lower. The diaphragm C, in vibrating, approaches nearer the soft iron core D, thus drawing a higher magnetic energy within the coil E, from the magnet H. The effect of this change of magnetic condition in the core D is to induce currents of electricity in the helix or coil, E; these currents varying precisely as the tones of the voice in speaking. The effects of these currents flowing over the line into an otherwise quiescent telephone, at the other end of the connecting wire, is to reproduce synchronous vibrations in the diaphragm of the distant telephone and consequently similar articulate sounds.

At the trials which have been made with the telephones which have been introduced by the California Electrical Works, this power to transmit sound by electricity has been well proved. Conversation has been so accurately transmitted that listeners could distinguish the voice and inflection of those they knew. Tunes whistled have been carried note for note. Experiments have been made at considerable distances and have succeeded, so far as the operators could control the condition of the wires, etc.; for example, some words were made out in a circuit from San Francisco to Oakland by way of San Jose. These results are very satisfactory, considering that our local electricians have but little practice in the use of the apparatus. As this instrument has come to us it will doubtless be turned to account by those who desire speedy and facile communication between distant points.

The Board of Supervisors have elected as Water Commissioners, Isaac Friedlander and A. C. Merrill. The Board then adopted a resolution introduced by Supervisor Strother, requiring the two Commissioners to subscribe to an oath that they did not hold any of the Spring Valley Water Company's stock, were in no way interested in such stock, and were not related by blood or marriage to any person who was interested in such stock. The order appointing Messrs. Friedlander and Merrill Water Commissioners was then passed to print.

#### An English Decision in Favor of the Dynamite Patents.

We give below an important decision in a patent suit, before an English Court, in favor of what is known here as giant powder. The suit was brought by the British Dynamite Company, (limited,) against Krebs. The following is the decision, which we take from the London Mining Journal of June 23d:

This was a patent suit relating to explosive substances, of interest in its subject matter, from the extraordinary physical qualities that have been discovered apper- a-ning to explosive substances, especially nitro-glycerine, and also as illustrating the quicksands an inventor has to steer through in taking out and substantiating a patent. The plaintiffs, when the bill was first filed, were the British Dynamite Company, then the owners of patents taken out by Mr. Newton of inventions communicated to him from abroad by M. Nobel. That company had since assigned their business to a new company—Nobel's Explosive Company—who were made co-plaintiffs. This suit related to a patent taken out in 1867 for dynamite. The defendants are manufacturers, at Cologne, of lithofracture, and their agents in England, who have sold that material in this country and also taken steps to set up a manufactory at Purfleet, in Essex. Nitro-glycerine was discovered in the year 1847, which, as is well known, is a very strong, but highly dangerous explosive. It was of no practical use, not only because of the great danger both in storing and carrying the substance, which was liable to explosion from very slight concussion, but also because the nature of the

weight of the nitro-glycerine without danger of exudation. The dynamite of the plaintiffs consists of 75% of nitro-glycerine, and 25% of kieselguhr. The lithofracture of the defendants consists of 55% of glycerine, 21 parts of kieselguhr and the remaining 24 parts of other absorbents, chiefly charcoal, bran, sawdust, sulphur, nitrate of baryta and other substances which have been called semi-explosives. The defendants admitted the usefulness of the plaintiffs' manufacture, though they put in evidence to show that lithofracture was a preferable material, in respect—first, that it did not produce the same disagreeable effluvia on account of more perfect composition, and also that it produced a better fracture for working quarries and mines. They denied the novelty of the invention, in that they alleged that the patent of 1863 was an anticipation of the one under which the plaintiff claimed; they also asserted that the patent was void as being too vaguely expressed, and not sufficiently clear to have enabled an ordinary workman to have made the article patented without experiment. They contended that lithofracture was not within the description; in addition to these objections which the patentees had to surmount, during the hearing an objection was raised by his lordship that the claims might be too wide as extending to the mode of ignition as well as the material. This point was brought out in evidence given by some of the scientific witnesses, which showed that Nobel had in 1864 published a remarkable discovery as to the mode of explosion of some substances produced by a shock instead of a flash, a discovery which has led to the use for explosive purposes of a fulminating cap, as it is called, in opposition to the less powerful ordinary percussion cap. The trial occupied some days, the greater part of the time being occupied in the examination of chemists and other skilled witnesses.

Mr. Aston, Q. C., Mr. Edward Cutler and Mr. Chester appeared for the plaintiffs; Mr. Cotton, Q. C., Mr. Nalder and Mr. Macrory for the defendants.

Specimens of the compounds were produced, but it was not considered that they were so perfectly safe that they might be made exhibits or retained in court, though both substances are licensed under the explosives act, 1875.

Mr. Justice Fry delivered an exhaustive judgment, in which he said that most of the usual objections had been taken against the patentee. It was conceded, however, that the invention was useful, and that the lithofracture had been sold in this country by the defendants. He would deal with the questions of novelty and sufficiency of description. The object of the earlier invention had been quite different from that vested in the plaintiffs. The former had been merely to produce a better explosive, as such to moderate and control the explosive force. That of the latter was to effect safety in storage and carriage. He was of the opinion that the invention was not anticipated. Again, on the evidence he was satisfied that the description was such that any moderately intelligent workman could at the time of the patent have produced from it a dynamite—a good and useful dynamite, though not so valuable as that made now with kieselguhr. But on the question of infringement, he must hold that the defendants did, notwithstanding that they introduced other matters into their manufacture, to some extent make use of the plaintiffs' invention; they did use a non-explosive compound for the purpose of absorbing and changing the nature of the nitro-glycerine, by which it was rendered safe from the danger of being exploded by a slight concussion. With the alleged superiority of the defendants' lithofracture and its freedom from disagreeable effects he had nothing to do. He had further to deal with a question that had been raised on the claim to the mode of ignition. On this he had been satisfied by the evidence that this mode of ignition by fulmination was novel as applied to dynamite; but even had it not been, upon a reasonable construction of the specification, he should hold the reference in the claim was merely for the purpose of illustration. The plaintiffs, therefore, were entitled to an injunction and to have an account of profits. If this became necessary, application could be made for a transfer of the cause that the account might be taken in Chambers.

#### General News Items.

THE Second Regiment Infantry, United States army, under the command of Col. Wheaton, sailed for Portland, en route for the Indian war, in the Oregon steamship, City of Chester.

A new enterprise in the skating line is being inaugurated in this city in the shape of a covered ring, 100 by 250 feet, the floor of which is to be artificial ice, and on which steel skates are to be used.

SIX mills of the American Powder Company at Acton, Massachusetts, exploded in succession on the 24th inst. Carelessness was the cause. One man was killed and nearly a dozen others barely escaped. Loss, \$10,000.

ARRIVALS at Castle Garden are becoming noticeably fewer. The authorities state that the number is even smaller than that of last year. The decrease is owing to had reports of the state of business sent from this country to Europe.

The object of the Newsboys' Union, which was permanently organized last week, is to protect those lads who sell papers for a livelihood from the inroads of those who do so for pocket money, and to provide for the maintenance of the sick and for mutual improvement.

For additional safety the porous substance was to be washed before use in an absorbent with an alkaline substance. The inventor claimed the mode of manufacturing the safety powder, as also the mode of firing the same by special ignition. Dynamite as actually made by the plaintiffs consists of a remarkable siliceous substance, known as kieselguhr and nitro-glycerine. Kieselguhr is an infusorial earth, composed of silica in a porous state, being formed of the minute shells of diatomaceae; it is capable of taking up three times its own

## Barometers in Mines.

The use of barometers and thermometers in mines, is exciting a great deal of attention in mining journals, incidental to the Tynewydd disaster. It seems to be generally admitted that when the barometer falls, the gas has advanced previous to the indications of the instrument. A barometrical fall of the eighth of an inch will at least serve as a warning. A north-country correspondent notes that on the 23th May last, there was a rapid and great fall of the barometer. The result was that a serious explosion of gas occurred in a lead mine near Hexham, and about the same hour a man was killed at Nantyglo by an explosion. This is at least a suggestive coincidence. As a general remedy against mining disasters from overcharged gases, a Yarmouth correspondent of a contemporary (Mr. C. Colwell) says: "As regards Hartley and Tynewydd, I maintain that with compressed air in either to the extent which I produced at Scottswood, the 204 victims in the former, and all in the latter, would have been saved. As every effort to pump the water out of the Welsh pit failed, I may ask why no attempt was made to combat this difficulty by natural laws? The application of air to compression in the inundated pit, or by exhausting it from the old workings, the water must have receded, so that every-one apparently entombed might have walked in safety to the shaft; as it was, however, poor Morgan fell a victim to the sudden escape of the pent-up atmosphere, and then my proposition as to the mode of dealing with pit air under compression was resorted to, and the next batch of our fellow creatures was saved." The subject is one of immense interest to South Wales, and a vigorous discussion cannot but add to existing information.—*South Wales Daily News.*

**TREATING COPPER.**—With a view to communicate great hardness, toughness, and homogeneity to copper and alloys of copper, so as better to fit them for certain industrial uses, Mr. W. E. Everitt, of Birmingham, takes oxides of manganese, preferably the native ore commonly known as the black oxide of manganese, in a state of fine powder, and in the proportion of from one to six parts by weight of the said oxide of manganese to 100 parts by weight of the copper to be operated upon. He puts the copper and oxide of manganese together into the melting pot or furnace, and when the copper is melted stirs the oxide of manganese well into it. As soon as the dross and scum have thoroughly separated from and risen to the surface of the melted metal, the copper or alloy is ready to be poured into ingot or other molds. In treating brass he proceeds as described with respect to copper, adding the required percentage of zinc to the melted copper. The alloys of copper to which the invention is especially applicable are alloys of copper and zinc, but he does not limit himself thereto, as his invention is also applicable to other alloys of which the essential metal is copper. Besides rendering copper and alloys of copper tougher, harder, and more homogeneous, the treatment described facilitates the rolling of alloys of copper at a red heat, and thereby effects an economy of time and labor in the rolling process. Copper and brass treated according to the invention are admirably fitted for the manufacture of steam-boiler tubes, bearing for shafts or axles, axle boxes, sheathing for ships, and bolts and nails for the same, as well as for sheet brass and brass wire. Although in practice he has found the native black oxide of manganese to answer well, yet he does not limit himself to the use of that particular compound of manganese, as other oxides of that metal, or compounds which on being heated yield oxide of manganese, may be employed with like results.

**RED-LEAD FURNACES.**—By the invention of Wm. Lang, Jr., of Glasgow, the lead is prevented from finding its way into the mass of brickwork. The beds of furnaces hitherto adopted being of solid brickwork, the lead has to saturate more or less this brickwork before a working furnace is obtained. Mr. Lang's improvements consist in making an iron sole, preferably in two pieces, of a shape similar to a trapezoid, or four-sided figure, having two of its opposite sides parallel. It is made of cast-iron or wrought-iron, and has flanges on all sides. The sole rests on butts of brickwork, and the surface is filled in with best fire-bricks to form the bed of the furnace. The other parts of the furnace are similar in construction to the furnaces or ovens at present in general use. The working of the new furnace does not involve any new process. The essential feature of the invention consists in the peculiarity of making the sole of the furnace of a cast-iron plate lined with brickwork, though for the sake of getting a better casting he casts the plate in two pieces, and then joins together with bolts and nuts; the same may be made in one piece, or can be made up of more than two pieces.

**WHY CAN'T IT BE FOUND?**—Several years ago a miner, while prospecting on Mill creek, came across a detached boulder, or rather a detached mass of hard, white quartz, which had rolled down the mountain and lodged on the point between the forks of the creek. In some parts of the quartz gold was visible, and by crushing it in a mortar a very rich prospect could be obtained. For a short time there was some excitement regarding it and quite a rush up that way, but the quartz bunters soon gave up the chase and the ledge has never been found. The

boulder is there yet, or what is left after the numerous "chippings" it has been subjected to, and any one wishing to take a look for the ledge can "take his bearings" from it. That the ledge is a very rich one, no one who prospects the rock will deny, and it seems as though it could be found with a little patient labor. Take a chance and see if you can't become a millionaire by bringing to light the "Mill creek bonanza."—*Plumas National.*

We are informed that the Lucas Sleeping Car Company have adopted an ingenious invention, just patented by Mr. C. E. Lucas, Atlanta, Ga., which promises additional comfort to sleeping-car travelers in cold weather. The invention consists in providing the wash-room of a sleeping-car or parlor railway car with a washstand composed of a double or two tanks, with a basin interposed between them, with pumps, one of the tanks being furnished with a coil of steam tubing connected with the main steam pipes by which the car is warmed; the object being to provide a supply of warm water for toilet purposes, and prevent the freezing of the water in the toilet tanks and pipes thereof during cold weather, an accident which frequently occurs with the common apparatus, and causes injury, inconvenience and discomfort. The advantage to the traveler, especially to ladies, children and invalids, of a constant supply of warm water for toilet use, needs only to be suggested to be appreciated.—*Railway Age.*

**MASSACHUSETTS HILL MINES.**—The Gold Hill mine, the oldest in this district, is starting up again, says the Grass Valley Union, after years of idleness. This ought to cause Massachusetts Hill to be put in working condition. We understand that parties interested in the Massachusetts Hill properties have lately held a meeting, and that a disposition to resume work there was strongly manifested. Starting up the Massachusetts Hill mines would be of incalculable advantage to the business and prosperity of this town, and will result in great gain to the owners of those mines. If any scheme for the resumption of work on that old and known to be rich hill is inaugurated, every one interested in the town or its business should lend a helping hand, if need be, in the matter.

## Mining and Scientific Press

Is the leading mining journal in America, and enjoys a large circulation among the more intelligent operators and workers in the gold fields of the world.

As a scientific and mechanical representative of the Pacific Coast, it is decidedly popular and a standard journal with the most thrifty industrial people of the Pacific States and Territories. Its authority is of the highest order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist, mining operator and intelligent mechanic and manufacturer will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post paid, 10 cents.

DEWEY & CO., Publishers, S. F.

## OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send one but worthy men.

J. L. THARP—San Francisco.

B. W. CROWELL—Amador, Placer, Calaveras and Tuolumne counties.

G. W. McCREW—United States.

A. C. KNOX—Plumas, Sierra, Lassen, Placer and Nevada counties.

C. N. WEST—Santa Cruz, Monterey and San Benito counties.

A. C. CHAMPION—Sonoma, Marin and Mendocino counties.

A. U. STRONG—Lake, Napa and Solano counties.

ED. T. PLANK—Dakota Territory (Black Hills).

JOSEPH DUMICK—Mendocino, Humboldt and Del Norte counties.

W. D. WHITE—San Bernardino and Los Angeles counties.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us against the acts and mistakes of others.

## Newspaper Fileholders.

Dewey's new elastic fileholders (black walnut), size of the Press, *Harper's Weekly* and *Scientific American*, for 50 cents. Larger sizes to suit any newspaper, 75 cents. By mail, postpaid, 10 cents extra. Cash with all orders. Patent allowed. Address, DEWEY & Co., Publishers, San Francisco.

## UNIVERSITY OF CALIFORNIA, 1877.

Colleges of Agriculture, Chemistry, Civil Engineering, Mechanics, Mining and Letters.

Examinations for admission, August 8th, 9th, and 10th. Term commences Thursday, August 9th. Tuition free to all residents of California.

MARTIN KELLOGG, Dean of Faculty.

JOHN L. BOONE,

Attorney and Counsellor at Law,

PATENT LAW A SPECIALTY.

Office—202 Sansome Street, N. E. corner Pine Street, San Francisco.

## Superior Pianos for the People at Popular Cash Prices.

More than TEN THOUSAND prosperous families on this Coast need Ten Thousand GOLDEN PIANOS to make TEN THOUSAND HOMES MORE PLEASANT AND ATTRACTIVE.

Prices of good Pianos have long been too high. Our people could not afford to buy them. But many will find it not only pleasant but profitable to purchase

## The Brilliant and Durable GOLDEN PIANO

Which we now offer the readers of this paper

## At Greatly Reduced Popular Cash Prices.

We Guarantee them to be as represented, of superior tone, finish and durability.

Samples can be seen by calling at this office. We keep no expensive sales-rooms and attendants.

We shall sell none but superior and desirable instruments, but give our customers the benefit of prices far below any before offered on this side of the Continent.

## Prices of the Golden Piano:

	The Installation Plan Prices.	Our Reduced Cash Price.
The Golden Piano, \$500	\$500	\$350
(UPRIGHT—C.)		
The Golden Piano, \$375	\$375	\$300
(SQUARE—No. 1.)		
The Golden Piano, \$500	\$500	\$350
(SQUARE—No. 2.)		
The Golden Piano, \$600	\$600	\$400
(SQUARE—No. 3.)		
The Golden Piano, \$800	\$800	\$450
(SQUARE—No. 4.)		

We invite our readers who wish to look at Pianos for themselves or friends, for immediate or future purchase, to call and examine our samples.

Those who cannot call will be given further information by consulting our agents or sending to this office.

## DEWEY &amp; CO.

## American &amp; Foreign Patent Agents

OFFICE, 202 SANSOME ST., N. E. COR. PINE, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent Reissues taken out Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Agency Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons; and our success and business are constantly increasing.

The shrewdest and most experienced Inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

## Foreign Patents.

In addition to American Patents, we secure, with the assistance of co-operative agents, claims in all foreign countries which grant Patents, including Great Britain, France, Belgium, Prussia, Austria, Baden, Peru, Russia, Spain, British India, Saxony, British Columbia, Canada, Norway, Sweden, Mexico, Victoria, Brazil, Bavaria, Holland, Denmark, Italy, Portugal, Cuba, Roman States, Wurtemberg, New Zealand, New South Wales, Queensland, Tasmania, Brazil, New Granada, Chile, Argentine Republic, AND EVERY COUNTRY IN THE WORLD where Patents are obtainable.

No models are required in European countries, but the drawings and specifications should be prepared with thoroughness, by able persons who are familiar with the requirements and changes of foreign patent laws—agents who are reliable and permanently established.

Our schedule price for obtaining foreign patents, in all cases, will always be as low, and in some instances lower, than those of any other responsible agency.

We can and do get foreign patents for inventors in the Pacific States from two to six months (according to the location of the country) SOONER than any other agents.

The principal portion of the patent business of this coast has been done, and is still being done, through our agency. We are familiar with, and have full records, of all former cases, and can more correctly judge of the value and patentability of inventions discovered here than any other agents.

Situated so remote from the seat of government, delays are even more dangerous to the inventors of the Pacific Coast than to applicants in the Eastern States. Valuable patents may be lost by extra time consumed in transmitting specifications from Eastern agencies back to this coast for the signature of the inventor.

## Confidential.

We take great pains to preserve secrecy in all confidential matters, and applicants for patents can rest assured that their communications and business transactions will be held strictly confidential by us. Circulars free.

## Home Counsel.

Our long experience in obtaining patents for Inventors on this Coast has familiarized us with the character of most of the inventions already patented; hence we are frequently able to save our patrons the cost of a fruitless application by pointing to them the same thing already covered by a patent. We are always free to advise applicants of any knowledge we have of previous applicants which will interfere with their obtaining a patent.

We invite the acquaintance of all parties connected with inventions and patent right business, believing that the mutual conference of legitimate business and professional men is mutual gain. Parties in doubt in regard to their rights as assignees of patents or purchasers of patented articles, can often receive advice of importance to them from a short call at our office.

Remittances of money, made by individual inventors to the Government, sometimes miscarry, and it has repeatedly happened that applicants have not only lost their money, but their inventions also, from this cause and consequent delay. We hold ourselves responsible for all fees entrusted to our agency.

## Engravings.

We have superior artists in our own office, and all facilities for producing fine and satisfactory illustrations of inventions and machinery, for newspaper, book, circular and other printed illustrations, and are always ready to assist patrons in bringing their valuable discoveries into practical and profitable use.

## Steam Engines &amp; Boilers.

NEW AND SECOND-HAND.

One Patent Straw-Burning, Portable En-  
 gine, (new,) fire box boiler, the best  
 Portable Engine on the coast; built  
 by Ransom, Sims & Head, Ipswich,  
 England.

One Steam Fire Engine, second-hand,  
 in excellent condition, with 200 feet  
 leather hose, very cheap, just the thing  
 for a small town. Button & Blake,  
 builders, Waterford, N. Y.

One second-hand Stationary Engine, 14x30  
 inches, link motion, with or without  
 hoist gear.

One second-hand Stationary Engine, 8x20  
 inch, with or without hoist gear.

One Upright Boiler, Horizontal Engine  
 on wheels, Eastern make, 7x12.

One Upright Boiler, Horizontal Engine,  
 San Francisco make, 6x12.

One small Stationary Engine, 3½x7 inch.

One Steam Boiler, 40 inches diameter, 16  
 feet long.

One 8x10 Straw-Burning Portable Engine.

One Traction Engine, three wheels, rub-  
 ber tires, double cylinder, 6x10 inch;  
 Thompson's patent, D. D. Williamson,  
 builder, New Jersey.

One Stationary Engine, 10x20, just had a  
 thorough repair, almost as good as new.

One Stationary Engine, new, 12x24, independ-  
 ent cut-off.

One 6x12 Engine and Boiler, can be mounted if  
 required. Very cheap.

Various other second-hand Engines and  
 Boilers for sale cheap.

G MAHE, Director,

## TULLOCH'S AUTOMATIC ORE FEEDER,

Awarded the Centennial Medal.

The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in  
 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is  
 so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop  
 regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an  
 automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each back-  
 ward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical  
 mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these  
 testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of  
 the parties certifying to those herewith given, will establish their value and genuineness.

Mr. Jas. G. Fair has 28 in use; says: I regard them superior to any Feeder with which I am acquainted; I con-  
 sider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no  
 man living can feed a battery as well; they save us in labor alone \$48 a day. Mr. Green, of the Phoenix mill (12),  
 Amador, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use  
 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are  
 running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar  
 since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Cold Strip companies, Plumas county, writes:  
 From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage  
 them; the saving in both labor and castings is fully one-half over the old style of feeding by hand. Mr. Preston  
 writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have  
 ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet  
 or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

F. OGDEN, 43 California Street, S. F.

## Rand's Rock Drill.

Its use in mines brings about

- 1.—Decreased cost of ore.
- 2.—Increased output of ore in a given area of working ground.
- 3.—Decreased number of men employed, consequently saving large permanent in-  
 vestments in houses for men when an increased production is desired.

Testimonials, Circulars and Price Lists, illustrative of the most recent improvements in this  
 class of machines, will be cheerfully furnished on application to the

## Buy the Best.

Before purchasing an American  
 Watch, examine the different styles  
 manufactured by the NEW YORK  
 WATCH COMPANY, at Springfield,  
 Mass. They are the latest and  
 best improved manufacture. You  
 can depend upon them for fine finish,  
 durability and perfect time. They  
 are sold at favorable prices—in  
 fact, no higher than many of the  
 inferior styles. Examine into the  
 merits of this Watch before you  
 buy any other. Our word for it,  
 you will not regret it.

CAUTION  
TO HYDRAULIC MINERS.

All persons, excepting those having the right by pur-  
 chase from me, are hereby cautioned against using, or  
 making, or selling any device for turning the discharge  
 pipes of hydraulic machines which uses the deflecting  
 force of the stream of water.

Any such device is an infringement of United States  
 Letters Patent, granted to me on the 16th of May, 1876,  
 and re-issued September 19th, 1876.

I have commenced suit against Richard Hoskin for in-  
 fringing my said patent, and intend to prosecute all par-  
 ties using such Deflectors without license from me, there  
 being no other way to protect my rights.

Any parties wishing to purchase the right to use this  
 device can do so by making application to me.

GUIDO KUSTEL,

MINING ENGINEER and METALLURGIST.

P. O. Address: ALAMEDA, CAL.

(Continued from page 53.)

shaft is down 100 feet in good ore. Two drifts are run in a short distance north and south from the bottom of the shaft. Five tons of assorted ore, recently shipped to San Francisco, yielded \$1,000 per ton. North of the shaft, a tunnel run in on the ledge 60 feet shows good ore. In the shaft is a two foot vein of ore that will work, without sorting, \$250 per ton. There are now on the dump from the shaft and tunnel, 40 tons of this kind of ore. Altogether ten tons of ore have been shipped from this spur to San Francisco. It averaged \$1,000 per ton; some of it yielded over \$2,000 per ton.

**TIGER DISTRICT.**—The mill recently erected in Bradshaw basin is one of the finest in the Territory. It consists of 10 750-lb. stamps, two pans of a capacity of 3,000 lbs. and one settler. The engine, 60-horse power, is claimed to be the best in the Territory. A roaster has been ordered, and will be on the ground and ready to put up about the 1st of September. There are 64 men at work in and about the mill and mine.

The Gretna, bearing silver, is considered one of the best mines owned by the Bradshaw & M. Co., and 15 men are at work on it. They are taking out some very fine silver ore, though we fear the ore is not worked as close as it should be, as we saw considerable apparently barren rock on the dump awaiting shipment to the mill. The owners of the mine will do well to remember that the reputations of many mines have been ruined by working everything between the walls.

We saw some very rich ore from the Mazepa, a new location, situated about one mile and a half southeast of the mill, and owned by Mr. Donahue. A force of six men are at work on this mine, which shows an 8-inch streak of ore that will work \$300 to the ton.

On the Eclipse, one mile and a half from the mill, five men are at work. At a depth of 20 feet it shows a two-foot vein, which will mill \$75 per ton. It is the intention of the company to keep on sinking on this ledge.

The Lorca, running parallel with the Eclipse, is also yielding very good ore. The discovery claim on this ledge is owned by the company. They have run an open cut along the ledge, and have already out 15 tons of ore that will work \$250 per ton. The pay streak is 15 inches in width.

The California, half a mile north of the discovery location on the Tiger, has a 62-foot shaft. There are also several cuts run along the ledge, prospecting it for a distance of 1,000 feet. Seven hundred tons of ore on the dump will work \$70 per ton. Assays along the entire length of the claim went \$200 per ton.

**ARIZONA CITIZEN.** July 14: Work is progressing on the Aztec mine. It is located in very rough mountains, and considerable labor has been required to build a road by which to transport supplies and materials to Camp Toltec—the Aztec camp. Manager Magee returned from the works early this week, and says the prospects are all he could wish.

**ORO BLANCO.**—A. C. Benedict was lately out in Oro Blanco district, where Messrs. Kirkpatrick, Flood and others are at work. All feel confident that a few months will prove the high value placed upon their mines. Mr. Flood said to Benedict: We are not saying much, but within three months we will have works under way and there will be no failure. Reports from the Santa Rita section are favorable.

## PATENTS AND INVENTIONS.

"More than Pleased."

OSCEOLA MINE, NEVADA CO., CAL., April 19th, 1877.  
Messrs. Dewey & Co.—Gentlemen:—We are more than pleased with your professional ability in the management of our application, and will always recommend your competency as Patent Attorneys, and your honorable and gentlemanly dealings with clients. Truly and respectfully yours,  
LOUIS R. TULLOCH.  
THOMAS D. TULLOCH.

# The Mechanics' Fair Daily.

By authority of the MECHANICS' INSTITUTE, OF THE CITY OF SAN FRANCISCO, the publishers of the MINING AND SCIENTIFIC PRESS will issue a large edition of the EIGHTH VOLUME of the MECHANICS' FAIR DAILY during the TWELFTH INDUSTRIAL EXHIBITION.

It will be of large size, printed and circulated FREE in the Pavilion, and contain the day and evening programme, and official bulletin of the Institute.

Its columns will embrace a large variety of important industrial and scientific information, illustrations and well written descriptions of the general features and most deserving and novel exhibits in the Fair, a record of the Fair and incidents of its daily progress—gay, serious and comic—as they occur.

The best of editorial, reportorial and corresponding talent will be employed, with a view to make the paper of live interest in all its departments and of standard value as a full record of the great exhibition, the wonderful inventions, rich resources and rapid progress of our great Western community.

Doubtless more than ONE HUNDRED THOUSAND different individuals will receive copies of our paper during the Fair. The fair character of the journal—the specially attractive features of its free issue in the Pavilion, and its absorbing interest to visitors at the Fair, the attention its columns command when brought into the shop and family circle by those who receive it freely at the Fair, make the paper a powerful advertising medium.

The managers have granted us the exclusive advertising and printing privileges and will receive no advertising in the official catalogue and reports.

Our previous volumes have met with unrivaled success and gratifying results to advertisers, nearly all of whom were leading and first class business firms.

Many thousands of marked copies were sent by mail and otherwise to friends near and distant, giving the FAIR DAILY a more broadcast and universal circulation than any other newspaper published.

Its columns are more closely examined throughout than those of any ordinary publication.

By past experience, ample facilities, and a fair reputation of doing business in our line, we expect, with the reasonable support of all naturally interested in the success of our enterprise, to make the coming volume superior to its predecessors, and eminently satisfactory to the Institute, to our patrons and to the general public, who are more or less benefited by such an advocate of the substantial advancement of the grand and worthy industries of our Coast.

DEWEY & CO., Publishers.

Office, MINING AND SCIENTIFIC PRESS, No. 202 Sansome Street, N. E. Cor. Pine, San Francisco.

Persons interested in incorporated shares  
will do well to recommend the publication  
of the official notices of their companies  
in this paper, as the cheapest appropriate  
medium for the same.

**Bella Union Quicksilver Mining Company.**

Location of principal place of business, San Francisco, California. Location of works, Napa County, California.  
Notice is hereby given that at a meeting of the Board of Directors, held on the twenty-eighth day of June, 1877, an assessment (No. 2), of ten cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 312 Montgomery Street, San Francisco, Cal.  
Any stock upon which this assessment shall remain unpaid on the thirtieth day of July, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twenty-fifth day of August, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. ABRAHAM HALSEY, Secy.  
Office, No. 312 Montgomery Street, San Francisco, Cal.

**California Fruit Growing Association.**

Principal place of business, San Francisco. Location of property, El Dorado county, Cal.  
Notice is hereby given, that at a meeting of the Board of Directors, held on the second day of July, 1877, an assessment of \$1.50 per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, No. 402 Montgomery Street, San Francisco, California.  
Any stock upon which this assessment shall remain unpaid on the twenty-fifth day of August, 1877, will be delinquent, and unless payment is made before, will be sold on Monday, the thirtieth day of September, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Directors. O. H. BART, Secretary.  
Office, Room 1, No. 402 Montgomery Street, San Francisco, California.

the corporation, payable immediately in U. S. gold coin, to the Secretary, at 313 Montgomery Street, San Francisco, California.  
Any stock upon which this assessment shall remain unpaid on the sixth day of August, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twentieth day of August, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.  
HORACE JONES, Secy.  
Office, 331 Sansome Street.

**Cherokee Flat Blue Gravel Company.**

Location of principal place of business, San Francisco, California. Location of works, Cherokee, Butte County, California.  
Notice is hereby given that at a meeting of the Board of Directors, held on the nineteenth day of July, 1877, an assessment (No. 38, of five cents per share) was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, Room 1, No. 402 Montgomery Street, San Francisco, California.  
Any stock upon which this assessment shall remain unpaid on the twenty-fifth day of August, 1877, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the seventh day of September, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of Board of Directors.  
O. H. BART, Secretary.  
Office—Room 1, No. 402 Montgomery Street, San Francisco, California.

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc., For sale at the lowest prices by  
J. HENDY, 49 and 51 Fremont Street, S. F.

Miners' Foundry and Machine Works,  
CO-OPERATIVE,  
First Street, bet. Howard and Folsom, San Francisco

### Machinery and Castings of all kinds.

### McAFEE, SPIERS & CO.,

BOILER MAKERS AND  
GENERAL MACHINISTS,  
Howard between Fremont and Beale Sts., San Francisco

## PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,  
RANKIN, BRAYTON & CO.,

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY, INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERS, ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, Etc., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster Rock Drills and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

IMPROVED PORTABLE  
Hoisting Engines,  
For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery.

### PHELPS MANUFACTURING COMPANY,

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle Work, Car Frames and Bolts, Machine Bolts, Set Screws and Tap Bolts, Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS. HOT AND COLD PRESSED HEXAGONAL AND SQUARE NUTS, WASHERS, BOLT ENDS, TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,  
SAN FRANCISCO, CAL.

### THOMPSON BROTHERS, EUREKA FOUNDRY,

Light and Heavy Castings of Every Description Manufactured.

Sole Proprietors and Manufacturers of

Lynch's Ventilating and Illuminating Tile, The Only Illuminating Tile Manufactured for Lighting Cellars, Basements and Dark Rooms which provides proper ventilation for such places.

129 and 131 Beale Street,  
BET. MISSION & HOWARD, SAN FRANCISCO

### CALIFORNIA BRASS FOUNDRY,

No. 125 First Street, Opposite Minna,  
SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE.  
J. H. WEED. V. KINGWELL.

And General Machinists.

## Machinery.

### The Ingersoll Rock Drill

Is Extensively Used in the East and

TAKES THE PLACE OF ALL OTHERS, Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other Drill in the market. It has but few parts, is easily handled, being light, and has AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to  
J. B. REYNOLDS,  
320 Sansome Street  
(Room 10.)

### The Gardner Automatic Safety-Stop Governor.

MORE THAN TEN THOUSAND NOW IN USE.  
EVERY ONE WARRANTED.

SEND FOR DESCRIPTIVE CIRCULAR AND PRICE LIST.

When all others fail, buy a "Gardner." We have all sizes of these celebrated Steam Governors on hand at all times.

BERRY & PLACE,

Selling Agents for the Pacific States,  
Cor. Market & Fremont Sts., S. F.

### THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:  
One man.....\$ 4 00  
One man.....3 00  
Wood—2 1/2 cords at \$3 per cord.....5 25  
Salt—1,600 lbs at 2 1/2 cents.....40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 61 1/2  
In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in Fresno District, Nev., and at the Eschequer mill, Alpine Co., Cal. For further information, apply to

D. J. O'HARRA,  
Reno, Nevada.

### BAKER'S ROTARY PRESSURE BLOWER (FORCED BLAST.)

WARRANTED SUPERIOR TO ANY OTHER  
J. C. Sanderling, Sole Ag't Pacific Coast  
51 Fremont Street, S. F.

### THE LANE & BODLEY COMPANY,

John and Water Sts., Cincinnati, O.,  
Sole Manufacturers of

# THE GIANT POWDER CO.,

Ask Your Special Attention to Their IMPROVED GRADES OF POWDER, Viz:

## No. 1 GIANT,

Now the Quickest and Most Powerful Explosive Compound in the World.

## No. 2 EXTRA, a New Grade,

Which will hereafter be our second grade. It is of immense strength,

Far Surpassing any POWDER of its Class Ever Before Manufactured.

NOTWITHSTANDING ITS GREATLY INCREASED STRENGTH,

Will be sold at the price of the old No. 2. Where a powder stronger than ordinary No. 2 is needed, we invite a trial of this new grade.

No. 2. Our Powder of this Grade will Continue of the Strength of our No. 2 of Last Year's Make.

It is a Strong, Reliable and sure Powder, and will do excellent work.

Special Attention is Called to the Reduced Price at Which We Will Hereafter Sell This Grade.

**JUDSON POWDER.** This New and Valuable Powder is Rapidly Coming into General Use as a Substitute for Common Black Powder, to which it is in all respects far superior.

Price 15 cents, or by car load 13 cents. In Cartridges, 2 cents extra. Discount as usual to the trade on our various grades of powder. Caps, single, double and triple force, also, fuse of all brands always on hand.

Send for Pamphlets and information to

**BANDMANN, NEILSEN & CO., General Agents Giant Powder Company.**

No. 210 Front Street, San Francisco, Cal.

# TWELFTH INDUSTRIAL EXHIBITION,

UNDER THE AUSPICES OF THE

**MECHANICS' INSTITUTE, SAN FRANCISCO, AUGUST 7th, 1877.**

The Board of Managers have the honor to announce that the TWELFTH EXHIBITION will be opened to the public on TUESDAY, AUGUST 7th, 1877, and continue open for at least 30 days thereafter. The Exhibition will be held in

## THE GRAND PAVILION,

Market, Eighth and Mission Streets, and easily accessible by six lines of City cars.

## THE EXHIBITION BUILDING---EXOTIC GARDEN---MECHANICAL ANNEX.

The BUILDING is 200 feet wide, 550 feet long, and 100 feet high, with a gallery around the inside 50 feet wide, beside a promenade 16 feet wide and 1,000 feet in length, from which an unobstructed view of the interior is obtained.

In addition to the above space there will be an EXOTIC GARDEN, 70 by 220 feet, for the display of the Fruits and Flowers of this Coast. Also, A MECHANICAL ANNEX, 200 by 50 feet, for the display of special Machinery.

A large and powerful engine will furnish the motive power for all machinery required to be in motion, while steam and water will be supplied in ample quantities to such machines or appliances as require them. The main line of shafting is 500 feet in length, with sufficient pulleys for all requirements.

## THE ART GALLERY

Is 400 feet in length and 50 feet wide, well lighted by skylights during the day and at night by the most improved reflectors. It will be made specially attractive, both in Pictures and Statuary. Many noted works of art are already promised, and it is confidently expected this department will excel anything ever before seen on this coast.

Over 6,000 gas lights will be used to illuminate the building during the evening. Four thousand seats will be provided for visitors. Also, a first-class restaurant, where refreshments of all kinds can be obtained at moderate prices.

## A GRAND INSTRUMENTAL CONCERT

Will be given each afternoon and evening by an orchestra composed of the best musical talent on this coast, and under the leadership of an experienced and popular conductor.

## PREMIUMS.

In accordance with the general request of exhibitors, the management have decided to offer liberal premiums at this Exhibition, consisting of medals and cash, all to be for the first degree of merit only. The medals will be of a new design, three and one-half inches in diameter, and similar to those awarded at the late Centennial exhibition.

A carefully prepared classified list of premiums will shortly be published.

Articles may be entered for competition or for exhibition only; if for the former they must be so designated when placed in position.

It is important that all parties intending to contribute to this Exhibition should give early notice of the amount and kind of space required.

A copy of the premium list, blank applications for space, rules and regulations, and any information regarding the Exhibition will promptly be given or sent by addressing the Secretary of the Twelfth Industrial Exhibition, San Francisco, Cal.

## BOARD OF MANAGERS:

# MINING AND SCIENTIFIC PRESS.

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.,  
Patent Solicitors.

SAN FRANCISCO, SATURDAY, AUGUST 4, 1877.

VOLUME XXXV.  
Number 4.

## The Coming Exhibition.

Before the next issue of the Press reaches its readers, the Twelfth Industrial Exhibition will have opened. All the arrangements have been completed and the exhibits are now being arranged in the Pavilion by the respective owners. All the available space having been spoken for, there is no doubt, of course, that there will be a full representation of our material progress. There seems to be a healthy spirit of competition manifest this year, which has resulted in quite full displays by different manufacturers and agents. The picture gallery will be particularly fine, we understand, so that lovers of art will not be disappointed.

The general arrangements will be somewhat the same as last year. The center will be occupied by exhibits of the agricultural and zoological productions of California and Oregon, wire-work, mirrors, articles of food, glass, and various miscellaneous contributions. In the right aisle will be machinery, pumps, the screw of the *Ajax*, artificial stone work, vitrified iron-stone pipes, asbestos roofing and metallic fire-proof roofs, bricks, oils and burning fluids, castings and products of foundries, quartz mills, and mining machinery, etc. At the end of the building, agricultural machinery. In the left aisle, principally carriages, buggies, wagons, and stoves of all kinds. The galleries will be allotted to furniture, sewing machines and miscellaneous articles.

The rookery and cave in the horticultural department have been completed. A stream of water will run through the cave and empty into the fountain, near the entrances. A large landscape, 70 feet in length by 35 feet in height has also been completed and will add greatly to the beauties of the garden. The sale of season tickets has already commenced, and the Managers are confident of a great financial success.

The opening exercises will take place on Tuesday, August 7th, at 2:30 P. M., at Baldwin's theater, Market street.

On the occasion of the opening of an exhibition of so much importance to the industrial interests of the coast, there should be a good attendance of those whose interests are represented. Artisans and mechanics of different trades should be allowed time to attend these exercises and those employers who can possibly spare their men, should do so on this occasion. A large has always appeared at the opening exercises of the different exhibitions and this one will not be behind the others in this respect; but as the fair is essentially an industrial exhibition, it is important that the industrial classes should be largely represented, and they should endeavor by all means to be present if possible.

The following programme has been arranged for the occasion:

1—Music.....	Band.
2—Introductory remarks.....	President Halliday.
3—Prayer.....	Rev. Mr. Jams.
4—Chorus.....	High School.
5—Recitation.....	John McCullough.
6—Music.....	Band.
7—Oration.....	Hon. Horace Davis.
8—Chorus.....	School.
9—Benediction.....	
10—Music.....	Band.

The exhibition will not be open to the public in the afternoon, but will open for the first time on the same evening at seven o'clock.

**COMSTOCK MINES.**—According to the returns made to the Assessor of Storey county, Nevada, the six productive mines on the Comstock lode produced the following quantities of ore during the quarter ending July 30th, 1877:

	Tons.	Average.	Bullion.
Belcher.....	6,837	\$23	\$ 134,753
California.....	49,967	92	4,627,450
Con. Virginia.....	39,773	95	3,775,362
Chollar-Potosi.....	9,104	15	145,489
Justice.....	40,776	13	743,063
Ophir.....	2,660	29	78,474
Totals.....	148,122	\$94	\$9,504,597

During the corresponding quarter last year the California mine produced 31,100 tons of ore, yielding \$4,519,700, an average of nearly \$146 to the ton, and the Con. Virginia mine produced 33,500 tons, yielding \$3,963,300, an average of \$118 per ton. For the same quarter the Ophir mine produced 18,250 tons, yielding \$669,200.

## Dry Amalgamation.

In those advancing times, when the mining community seem to be emerging from the old modes of handling our gold and silver ores, and especially as the reducing of them dry, no matter by what process they may be amalgamated, is generally conceded by our most experienced miners as being the surest for obtaining the largest per cent. of the precious metals, any machine performing this important work cannot otherwise than be particularly interesting to our mining readers. To this end we here illustrate Paul's patent pulverizing barrel, for the reduction of quartz to an impalpable powder, dry.

The cut here shown is an excellent view of one of the most durable and thoroughly practical pieces of mining machinery as yet introduced for this end. In operation it is pronounced by those who have used it as perfect in every detail. The inventor is Mr. Almarin B. Paul, whose mechanical skill has been displayed in very many articles of mining machinery, but of which this pulverizer, for ingenuity

No. 20 fine to flour, or even its approximate, then such machinery is not only expensive, but to do it dry, very disagreeable. This pulverizer of Paul's overcomes all these disadvantages.

The capacity of these barrels is only limited by the size. The largest yet made, however, has a capacity of 15 tons for 24 hours, reducing through wire cloth, having 4,900 holes to every square inch, or 12 tons reducing to 6,400 fine, or ten tons \$1,100 fine, this latter is absolute flour. A re-issue of this patent which embraces all the latest improved features, has just been obtained through this agency of Dewey & Co. It may be well here to say that these barrels are now being used in California, Nevada, Colorado, Arizona and Oregon, consequently they are no experiment. Such of our readers who may desire further particulars as regards this pulverizer, can obtain the same by addressing the inventor, Mr. Almarin B. Paul, room 20, Safe Deposit building, San Francisco, Cal.

## Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from

PAUL'S PATENT PULVERIZING BARREL.

and usefulness, excels. The cut represents a half section of the barrel, and shows both the interior arrangement, with the perforated plates and guards, and also the exterior or sieves, through which all the pulverized ore passes, and mode of securing same to the periphery of the cylinder, all of which may be more minutely described as follows:

A represents the heavy iron plates which really form the barrel. When the ore is reduced to a given fineness, it sieves through these plates and on to the fine wire screens, B, which form the outside circle of the barrel. One of the ingenious features of the barrel is that all ore passing through the iron plates, and not fine enough to go through the wire screens, returns to the inside of the barrel at every revolution, at the point marked C. The turned plate at C forms a protection for fine screens, so no breakage can occur from the heavy quartz used for pulverizing the finer.

The cylinder is set on axles, and revolves to the left, as shown by the dart. It is all enclosed, thus preventing the escape of any dust. A very important point of this machine is, that it is self-feeding as well as self-discharging, and, that it enables ore to be pulverized to any standard of fineness, as per the wire cloth used upon the frames.

The purpose of this pulverizer is not to do away with stamps or other crushing machinery, but to come in as an intermediate one for doing the finer work cheaper and at the same time increase the capacity of the former by allowing them to work even coarser. Crushing ore only moderately fine can be readily accomplished by stamps, but when you undertake to reduce from, say

letters of the respective Superintendents on file at the offices in this city:

The ore in the south drift of the Leviathan has increased in quantity and improved in quality.

In the Gila the drift from chute No. 1, is now in 20 feet and has been in rich ore the entire distance, some of which assays from \$4 to \$600 per ton, and will probably average \$300. In the crosscut the indications for a body of ore look very encouraging.

The Justice south lateral drift, on the 1000-foot level, is looking very fine. The vein is, however, in a somewhat broken state; notwithstanding which some fine ore is produced and good progress is made in advancing the drift to the south.

The Grand Prize stopes continue to look fine; both mills are doing excellent work. The new mill is now running up to full capacity and crushing about 40 per tons per day. The ore is milling about \$100 per ton.

They have struck fine ore in paying quantities on the 150-foot level of the Coso Con., and are now breaking at this point the finest ore ever taken from the mine. The stopes above and below the 100-foot level continue to yield the usual quantity of good ore.

In the Eureka Con. the ore bodies on 5th and 6th levels are improving in extent the further the work is advanced. Have struck some ore in 10th level, with very fair prospects of striking an ore body. The furnaces are running along with the usual production, turning out about 24½ tons of bullion daily for the past week.

## The Rich Men of San Francisco.

If San Francisco cannot boast of having the richest man in the world, she can certainly claim to have the largest number of millionaires in proportion to her population, of any city in the world, and from the rapidity with which her rich men are adding to their capital, it is not unreasonable to suppose that not more than two or three decades will pass away before she will lead the list of the world in the individual fortunes of her wealthy men.

Probably the richest men in the world, at this time, are the Rothschild Brothers, whose incomes are estimated at about \$10,000,000 each, per annum; the Emperor of Russia, who receives an annual income of \$10,000,000, and the Duke of Westminster, whose income is now estimated at \$4,000,000, much less than it was a few years ago.

Compared with these names we have, in San Francisco, Flood, O'Brien, Mackey and Fair, sole owners of the Bank of Nevada, each of whose incomes exceed \$5,000,000 per annum; Stanford, Huntington, Crocker and Hopkins, who own nearly the entire stock of the Pacific railroad, with an annual income of fully \$2,500,000 each; Lux & Miller, \$2,000,000 each; D. O. Mills, President of the Bank of California, \$1,200,000, and Michael Reese, \$1,000,000; Donahue & Kelley are also supposed to be in receipt of \$1,000,000 each. The fortunes of all these men are increasing in a ratio, probably fully quadruple to that of any of the leading rich men of Europe.

San Francisco can boast of not less than forty persons whose fortunes exceed \$4,000,000, and probably nearly or quite as many more are worth from one to three millions of dollars. No city in the world can show anything like such an array of millionaires, in proportion to its population. When we take into account the fact that none of this is inherited property, and that it has all been acquired within about twenty-five years, and by legitimate business alone, the possibilities of San Francisco may well challenge the attention of the commercial world. None of the men of this city whose names have been mentioned have yet passed the prime of life.

These and similar facts are not unfamiliar to intelligent persons in Europe, and they are frequently alluded to in leading journals there, freely commented upon, and their significance freely if not fully considered and accepted. They are also considered in connection with the wonderful resources of this coast, and with the peculiar location of our city and her unrivaled harbor. The fact seems to be accepted that nature and the enterprise of the capitalists and leading men of this city, will soon place it at the head of the commercial cities of the world. It does not need an over sanguine temperament to predict that our next Centennial will find San Francisco the largest and the richest city in the world.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: Grand Prize, July 25th, \$12,200; Chollar, 25th, \$6,490; Con. Virginia, 26th, \$171,548.98—total on July account, \$676,228.81; California, 26th, \$161,046.52—total for July account, \$849,213.67; Northern Belle, 24th, \$10,562.75; Standard, 25th, \$19,154.52; Endowment, 27th, \$2,225.45—total to date, \$8,344.75; Northern Belle, 26th, \$11,067.31; Arizona, 28th, \$1,396.78; Grand Prize, 28th, \$12,200; 29th, \$13,000; Ophir, 26th, \$7,824.47; Modoc, 26th, \$3,224.15—total to date, \$39,364.90; Tyho Con., \$8,350.34—total to date, \$58,630.95; Modoc, 30th, \$3,211.92; Tyho Con., 28th, \$8,287.53—total to date, \$64,617.48; Northern Belle, 29th, \$14,002.40; California, 31st, \$169,083.55—total to date, \$1,018,247.22; Leopold, August 1st, \$3,500; Grand Prize, 1st, \$12,800; Chollar, 31st, \$16,273.40; Con. Virginia, 31st, \$278,452.65—total to date, \$954,681.46.

THE Empire (Grass Valley) in Nos. 6 and 8 south continues very small and the ground very hard, and no indications of improvement. Quartz is very scarce at present, the ledge being so small throughout the mine.

## In the Midst of a Cave.

## A Bit of Underground Experience.

Below the croppings of the Gould and Curry mines is to be seen a large cavity or sink which marks the spot under which a great cave occurred during the superintendency of Charley Bonner. Happening to pass over the ground yesterday we were strongly reminded of a rather perilous trip which we made into the underground regions of the mine at the time the cave occurred.

Luckily ample warning had been given by the settling of the ground within the mine and the snapping and splintering of timbers; therefore no lives were lost in the cave.

News of the grand crash in the mine spread rapidly through the town, and all who heard of the accident gave a sigh of relief when told that all the miners escaped uninjured.

The full extent of the cave, and the damage done thereby in the interior of the mine, was not known for some time, but from the cavity formed on the surface was judged to be very great.

Being desirous of obtaining, if possible, full particulars in regard to the condition of the underground sections of the mine, we called upon Mr. Bonner and made known our wishes.

"I have not been in the mine for three or four hours, and therefore am unable to give you an exact account of the present condition of the caved portions. However, if you will venture with me," said Mr. Bonner, "we will go in as far as possible and see how things look."

Having agreed to Mr. Bonner's proposition, two lanterns were procured and we soon found ourselves on the level where the greatest damage had been done. The miners had all left that part of the mine. Nowhere was to be seen the friendly twinkle of either lamp or candle; all was dark as the caves of the Cimmerii, save where the light of our lanterns fell upon the walls of the tunnel, along which we were advancing, or where the rays streamed far ahead and were reflected back by points of polished pyrites or bright quartz crystals.

At first, too, all was silent as the tomb, but, as we moved forward, the sharp snap of a failing timber or the dull boom of a heavy fall of earth reached our ears. These sounds constantly grew more distinct. Soon was heard a sort of running fire of sharp little snaps from the bent and splintering timbers, with ever and anon a startling musket-like report as some large timber broke in twain or was rent asunder.

We were now fast nearing the scene of the cave. And yet the ground about us was sound, and all the timbers stood intact in their places. Our advance was slowly and cautiously made. At times some unusual commotion caused us to halt and listen half a minute, with bodies inclined forward and eyes strained to penetrate beyond the light thrown out by our lanterns. Few words passed between us. "Wait a bit," or, "Now let us move on," from Mr. Bonner, was about all that was said.

Presently we came to a drift leading from the tunnel we had been traversing. The snapping and grinding sounds were now more distinctly heard.

"It is in this direction," said Bonner, leading the way into the drift.

We had not proceeded far before we came to where the timbers of the drift were badly bent and displaced. We were in a spot where the ground was settling. A kind of ticking noise came from the lagging overhead and along the sides of this drift, and dirt sifted down on our hats.

Soon we reached a place where the posts on the sides of the drift were bent like bows. The backs of these bows projected into the drift and were full of splinters, some of which were formed—snapped out—before our eyes. Shortly we came upon two posts bent out from opposite sides of the drift till their backs were not more than a foot apart.

"This looks bad," said Bonner.

"Very. Let us go back," said we.

"It cannot be far to the edge of the cave. We want to see that. Suppose we venture? Timbers are still strong when they snap."

"Then move on," said we, but our legs wanted to go the other way.

In passing between the two bent posts it was necessary to turn our bodies edgewise. All about us the timbers were working and groaning, but still stood some distance apart. At the end of the drift we came into a large open space—what seemed a long and broad chamber—and turning westward across this we were soon as near the edge of the cave as it was thought safe to venture.

Holding our lanterns above our heads, we saw before us a black and yawning pit or chasm. The light of the lanterns failed to show us either the top or bottom of this pit, nor could we see across to the further side. It seemed to have neither top nor bottom—seemed but a shapeless, boundless region of darkness.

Into this frightful pit there fell every half minute, from somewhere in the darkness high above, great masses of earth and rocks. At times, judging from the thunderous sound, hundreds of tons at once tumbled from the roof and sides of the chasm. Smaller masses were almost constantly dropping in some direction, while the spluttering, snapping and groaning of timbers in all directions was something frightful.

Suddenly, as we stood quaking in the midst of the tremendous commotion, a great mass of rock and earth fell from some place high up on the wall of our side of the shoreless sea of

darkness, almost grazing the brink of the chasm before us. With the fall of the mass came a rush of wind that nearly extinguished the candles in our lanterns. Elevating his light and gazing upward Mr. Bonner cried: "Fall back! fall back! the roof is giving way!"

Almost as he spoke a mass of several tons fell from the roof of our chamber not ten feet in front of us, and in falling took a large bite out of the edge of our floor.

"Quick, quick! This way! We must get out of this!" cried Bonner.

We ran back to the drift by which we had entered. The two posts between which we had squeezed had closed together.

"Back, back!" cried Bonner. "This way! I know a drift. Quick, we may reach it!"

Back along the drift we darted amid sounds never to be forgotten and such as have seldom stunned mortal ears. All about us was in motion—all rapidly sinking.

Bonner led the way across the chamber we had left a few moments before. In a corner, on the east side, the light of his lantern showed the mouth of a drift toward which he was hastening. Hardly was there time to observe this before he held up his lantern, crying, "Back, back!" and with a rumbling crash the mouth of the drift closed and the ground before and about it began to disappear.

"Quick!" cried Bonner, grasping our arm and hurrying us along. "To the drift again. It is our only chance!"

Into the drift we once more darted. Squeezing our way between the cracking posts we reached the place where we had before been stopped. Though crushed together in the middle, there was still a small open space between the posts at the bottom.

Throwing himself flat on the floor of the drift, Bonner pushed his lantern through the opening, then by a mighty effort struggled through after it. He seemed an hour in passing, though he probably wriggled through in less than ten seconds. Our fear that he would stick fast was agonizing.

"Quick! Give me your hands! Leave your lantern!" shouted Bonner, the moment he was through.

Instantly we were down and bad both hands thrust through the opening. In about two seconds we were hauled through as a hunter pulls a squirrel out of its skin. A short dash took us to the main tunnel, and as we gained it Bonner fervently exclaimed: "Safe at last, thank God!"

We were about to make similar utterance, when Bonner thrust his lantern into the mouth of the drift, crying: "Look, look! There she goes!" and as he spoke down went the shattered portion of the drift, breaking away to within fifteen feet of where we were standing. "Let us go," said we; "the whole mountain is falling!"

"All is sound here," said Bonner, "yet I don't care to remain longer. Had I known what we were getting into I should never have passed through this crumbling drift. However, 'all is well that ends well,' and you have seen and heard what you will probably neither see nor hear again should you remain in the mines all your life."

It was rather a lively bit of underground experience.

## The Big Air Compressor at Work.

The huge new air compressor, says the Gold Hill News, appropriately christened by the boys "Eolus," at the C. & C. shaft commenced operations on Saturday last, and is asserting its ability as the champion blower of the State. For lung capacity and endurance it is a powerful rival for the most rampant of our Washoe zephyrs.

The air cylinder is of 30 inches diameter and 36 inch stroke, lined with composition. This is encased in a water jacket, through which the circulating water carries off the heat engendered by the compression of air. The admission valves are supplied with safety rods and distance guards; the first preventing the valve from falling into the cylinder if the main stem breaks, and the second regulating the lift. The piston is packed with composition rings and fitted with a steel rod, and the crosshead, connecting rod crank, pillow block and shaft are of the most improved and substantial kind. The fly-wheel weighs 34,000 pounds and runs with the utmost smoothness and perfection. The steam-engine is fitted with all modern appliances and is a representative of the highest mechanical construction in that line to date. The cylinder is of 27 inches diameter and 36 inch stroke, fitted with steel rods and brass bushes. The balance valves and cross cut-off are adjustable while in motion, and all the work and material is of the best attainable. This mammoth machine, weighing 120,000 pounds and resting on a solid mass of masonry 20 feet deep, takes its place at the C. & C. shaft as the finest air compressor in operation on the Comstock.

There were three of the largest sized air compressors, two at the Consolidated Virginia and one at the C. & C. shaft, in full operation before the erection of this last, all connected with air pipes, but this last machine has a power more than equal to that of the three combined.

May it never lose its wind while there is a heated drift to cool or a panting miner on the levels below wanting more of the life-sustaining oxygen. This machine was manufactured by Prescott, Scott & Co., of San Francisco, who may well feel proud of their triumph, and who need no better recommendation for the manufacturing of such appliances than its exhibition when in full blast.

## Lowell Hill Gravel Mine.

M. Byrns, Jr., Superintendent of the Planet gravel mining company, situated on Lowell Hill district visited the mine on the 16th inst., and found everything in a satisfactory condition. The contractors Messrs. Schaefer & Wm. Keskeys are driving the tunnel in as fast as possible and expect to tap the channel by New Year's day if no harder rock is encountered than they have at present. The tunnel is a beauty, and shows what real miners can do; a tall man can walk upright with his plug on without touching the timbers, and a pair of Swimley's boarders can find room while the car is passing them; everything is done in the strongest and most approved manner and the tunnel is as straight as a line can be drawn. Mr. Byrns visited the adjoining mine, the celebrated Swamp Angel, and was kindly received by the Frick Brothers who own one-half of the mine. He found this main tunnel running in an easterly direction from Steep Hollow toward Bear river; at a point 600 feet from the mouth, the gravel is cut, and the present tunnel pierces it for a distance of 740 feet without any indication of getting through it and as no water flows from the tunnel, the opinion prevails that the main channel has not yet been reached. Cross tunnels have been driven in the gravel 700 feet north and 400 south and through all this immense deposit, which 50 years constant work through one tunnel will not exhaust, the gold seems to be uniformly distributed so that the owners can clear from \$12 to \$14 per day to each hand. Byrns asked George Frick what he thought of the Planet as a mining investment; he said, "your ground is as good as ours, and if I did not have all the mining business I can possibly attend to on my hands, I would invest the last half-dollar I own in your mine; that is I have faith enough in its real merit to warrant me in so doing."

Another strike in the same channel is Pat McCann's on the opposite side of Steep Hollow from the Swamp Angel; this is uncommonly rich and so extensive that the owner has already as much ground prospected as he can work through one tunnel in five years; both it and the Angel show gold identically the same as Bald Mountain yields and it is doubtless all from the same old river bed. For the information of stockholders in the Planet we wish to say that no officer connected with it gets any salary; they are working solely to make it a success, and look for their pay in the enhancement in value of the stock they hold. Every man who takes a share in this valuable property can rest assured that he will be fairly dealt with, for the management will countenance no rings or sharp practice and every owner will at all times be thoroughly posted on the situation of the mine by calling on any of the officers.—*Grass Valley Union.*

## The Cost of Smelting.

## Eureka and Utah Compared.

We give below a communication from a miner of Eureka district to the Salt Lake Tribune, contrasting the difference in the cost of smelting custom ores there and in Utah. It appears that the miners of Utah get better prices for their ores than is paid in Eureka:

In your issue of July 7th you gave an article on the small profits in reducing the ores of Bingham canyon, wherein the lead is made to pay the whole cost of mining, freighting, smelting, desilverizing, etc., leaving a profit of only \$1.20, thus leaving the silver it contains dead-head all the way through. Why not charge some of this cost to the silver contained in the bullion? Here at Eureka, which is also a lead producing camp of considerable importance, we make our profits on the silver, the lead being only a help to the cost you enumerated. Lead here is worth 60 cents per unit over 20% for a basis, giving us \$12.50 per ton for ore carrying 45% lead, over the silver, on which is paid 64% of assay value, while the cost of working is from \$20 to \$25 per ton, thus taking from \$7.50 to \$12.50 per ton from the silver to pay for working. So you see our lead goes only so far in paying the expenses, and our silver is not allowed to deadhead it through like Utah silver. I send you this to show you the difference between the way things are done in Utah and Eureka. Some of our smelters pay only 40 cents per unit over 20% basis for lead.

SAN PETE COAL.—A number of English gentlemen have gone to San Pete to examine the coal fields of that valley, and the practicability of a railroad from there to market. We understand that there is talk also of the Central Pacific Railroad Company purchasing some of these claims, with a view to putting down a road from Ogden to San Pete valley. Such an undertaking would relieve the Central Pacific of their allegiance to Apostles Gould and Dillon, and at the same time develop one of the richest resources of this Territory. The extension of the Central Pacific to San Pete would create a competition in the coal and coke trade, as well as reduce the price of freight on the exports of Utah. But as matters now stand, the Pacific road is dependant upon the U. P. for coal, the price of which is of more importance to it than the margin on outgoing freights from the Territory; hence Apostles Gould and Dillon have a monopoly of the freight tariff by reason of their coal monopoly, and they will continue to so have it until the Central Pacific frees itself from their clutches by opening up coal fields of its own.—*Salt Lake Tribune.*

## Meadow Lake.

The Dutch Flat Forum speaks of this old district as follows: The Pittsburg company's ledge is located on Excelsior flat, and shows a width of six feet along the surface. The quartz is of a dark color, and of the usual quality found in the district, with the exception of a narrow vein of white quartz, running parallel with the ledge. This white quartz was found to be rich in free gold, and does not carry any of the base metals, with which all the other ledges in this district are cursed, as they have not, as yet, been subjected to any process by which the gold can be successfully separated from the baser metals. A shaft is being sunk on this ledge, and although they have only reached a depth of 10 feet, the streak of white quartz that was only four inches wide at the surface has increased to two feet, and none of it assays less than \$30 per ton, but the greater part of it shows a richness of from \$250 to \$450 per ton. This has caused considerable excitement among the Meadow Lagers; some who had become disgusted and left have returned and are making new locations. Others, who never lost confidence in the richness of their mines, stuck to what they had, and gobbled up other ledges as they were abandoned, are now feeling jubilant.

A gentleman by the name of Mr. Crail, one of the first locaters in this district, but who left shortly after, when it was discovered that none of the ledges could be made to pay unless some new process could be discovered for their successful working, after an absence of several years, returned recently from Wyoming Territory, and is now located at Meadow Lake. He has with him a patent on smelting works, "himself" the inventor, and claims that through this process the ledges of Meadow lake can be made to pay good dividends. Frank Pauson, of Truckee, one of the heavy owners in this district, has furnished Mr. Crail with the necessary means to construct and put his smelting works in working order.

## Gold Hill Mine—A Good Start.

A day or two ago we took a walk over to Gold hill. Here is the first quartz location in Nevada county—early in the summer of 1850. The Gold Hill grounds which have lately passed into the hands of a new company, are partly within, partly outside the corporate limits of Grass Valley, hence the new movement is one of more than usual interest to our citizens. During the 14 years of the history of this mine, from its location in 1855, it is believed to have turned out not less than \$4,000,000 in gold bullion, and owing to the peculiar character of the ore good judges declare that half as much more gold was taken out in the shape of "specimens," making the yield of the mine \$6,000,000. This, too, from mere shallow workings—the greatest depth attained being no more than 300 feet on this incline.

For the first 140 feet this shaft dips at an angle of 45°, until it strikes the vein, which it follows 160 feet more at an average dip of 28°.

The new shaft, which was just begun and the first combination of timbers just set as we were there the other day, starts in some distance back of the old one, and will go down at a dip of 32°, so as to give the whole 300 feet that dip, and allow of the free working of the big pump at that level. The present company, under the superintendence of Mr. George Lord, a miner of large experience and who was one of the last to work in this mine in its balmy days, intend putting on machinery of capacity to work and drain the mine to a depth of 1,000 feet. A splendid 16-inch engine, with boilers to match, is already on the ground and the work will be pushed to completion at an early day.

This resumption of work in that region will undoubtedly start up many more old favorites known to be yet good. There is said to be a continuous communication in quartz between the workings on Massachusetts hill and Gold hill and should the consolidated interests on the former take hold and put down a big, permanent shaft on Seadden's flat, these mines would very soon add an equivalent of 2,000 or more to our population.—*Foothill Tidings.*

"A WARNING TO INVESTORS."—Mr. Thomas Moy writes to a London, E. C., morning paper under date of June 26th, as follows: My advice (the result of long experience) to investors, when they are going to communicate their inventions to the government, is—don't. The case of Thomas vs. the Queen is one more instance proving the above to be sound advice. It is a monstrous injustice to inventors that their inventions may be used without remuneration. The individual may not be a pirate, but the whole nation may be legally a nation of pirates. Fifteen years ago I invented and proved by experiment, on a small scale, a valuable improvement, which would have been exceedingly useful to the Royal navy, and therefore to the nation at large. I wrote to the Admiralty, offering to communicate my invention to them, provided they would undertake to remunerate me if they adopted it. They replied by sending their usual circular, and refusing to guarantee remuneration. That was enough for me, and so I have kept my secret for 15 years, and shall continue to do so until I can see my way to be well paid for it. It would be of great use now to our navy, but I am not loyal enough to go through such experiences as Suider, Palliser and Lynam Thomas have had from the idiotic conduct of government officials.

## MECHANICAL PROGRESS.

## A New Form of Boiler.

Boiler-makers know that it is not easy to draft a form of steam boiler which will not show objectionable points, and when the need comes to increase capacity, all danger and difficulties increase in a geometrical ratio. We read in *Iron* that an English firm hope to overcome the objections which can be brought against the old Lancashire and Cornish styles of boilers by introducing another design:

It is formed principally by two parallel shells of comparatively small diameter, which are connected by a large number of short vertical tubes. These two principal shells are placed one above the other, and again above the upper shell is connected a small steam-chest with two small pipe connections, one at each end. The employment of this form of elephant boiler with two or more shells and externally fired, enables large grate surface to be provided with small diameter of shell, thus proving extremely valuable for burning wood shavings, or any other light combustible, and, at the same time, enabling the boiler to carry a comparatively high working pressure with safety, say from 80 to 100 pounds per square inch.

The arrangement of the double shell also provides that very little danger is likely to be incurred from shortness of water, as in Cornish or Lancashire boilers. For in these latter boilers a fall a few inches below the average water level will lay bare the crown of the flues, which are the plates most exposed to the fiercest heat of the fire, and therefore the most likely to be burnt and to collapse. In the elephant boiler the average water level is at a height of two-thirds of the upper shell. The fire, also, is placed underneath the lowest shell; then returns along the sides of that shell and then back again under the upper shell. The whole boiler must then be entirely empty before the plates nearest the fire are laid bare, and should the upper shell become entirely emptied the plates would not be exposed to sufficient heat to cause any serious apprehension of danger. This is a great point of safety, as many explosions are undoubtedly caused by over-heated plates from shortness of water.

A special and unique feature in this new boiler is an ingenious arrangement of dip tubes to promote circulation. In every alternate short connecting pipe between the two shells a loose dip tube is dropped within a few inches of the bottom plates of the lower shell. These tubes will determine the circulation downwards through them from the upper shell, and the upwards circulation of steam and hot water will ascend through the alternate short junction pipes without dip tubes. The circulation thus produced is most decided. A stream of the coldest water is brought down directly to the hottest plates over the fire, which are thus much protected from wear and tear, and one of the great evils in long cylindrical shell boilers, viz.: "hogging," is, we should believe, entirely prevented. The main shells of the boilers are brought out beyond the brick setting by projecting manholes, which will prove very handy in cleaning out and inspecting.

## A Monster Sugar-Pan.

We use sugar machinery in this State and our mechanics make some of it. Both users and makers will be interested to read of the largest vacuum pan ever made. *Iron* says it was made by James Duff & Sons, Greenock, and gives a long description. We take out a few points on dimensions: This "giant" of the vacuum-pan tribe is about 13 feet in diameter at its widest part and a little over 14 feet in depth from the top flanging, or 11 feet from the boiling line. It is somewhat of the heart shape, presenting as it does, the form of an inverted irregular cone, contracted to a point at the apex and widening gradually and quickly towards the base, the lower part being somewhat flattened. The body of the pan is built in three tiers, consisting of the bottom, the "crib" or center-piece and bell-mouth respectively. The bottom is in one piece, while the "crib" is composed of three large segmental copper plates, joined together in a curved circle by means of flanges at their side edges, and to the bell-mouth and bottom respectively, by means of flanges at their upper and lower edges. The bell-mouth or top-piece is then surmounted by a large tapering copper pipe or neck (called the "swan-neck"), by means of which the pan is connected to a large cast-iron condenser on a super-jacent floor of the refinery building, the condenser being in turn connected at the back end (for it is set horizontally) by means of a large pipe, (called the "vacuum pipe") to two powerful exhausting air-pumps, placed in communication with the pan, the water of condensation being carried off from the condenser through the medium of a so-called "balance" or "atmospheric" pipe. Intermediate between the vacuum-pan and the condenser, a large copper receptacle (called the "tell-tale" or "safe") depends from the under side of the neck-pipe, for the purpose of catching and retaining, till the close of the boiling operation, any liquor

that may be carried over from the pan towards the condenser through violent ebullition, and which, if not so caught, would pass on to and through the condenser and so be carried off with the water of condensation and lost. The contents of this vessel are indicated by means of a glass gauge at the side and are drawn off in due course through the medium of a stop-cock at the bottom.

The lower half of this monster sugar-kettle contains the heating media, which consist of no less than 11 large serpentine steam-worms, spirally arranged and adapted to the curvature of the pan. These steam-worms are four and a half to five inches bore and about 900 feet in combined length, giving a heating surface of 1,119 superficial feet or thereby.

The gross contents of the pan, up to the boiling line, is 973 cubic feet, or about 6,080 imperial gallons. The worm displacement amounts to 111 cubic feet, thus leaving the net capacity of the pan 862 cubic feet or thereby, while the heating surface stands to the net capacity as 1.3 to 1. It is calculated to boil 40 tons of sugar when charged to the boiling line, the time occupied in the process being from four to seven hours, as the quality of the liquor and other circumstances may vary; the product in marketable sugar from this quantity being from 47 to 50 tierces. The shape of the pan is highly favorable to quick boiling and rapid evaporation and concentration of the syrups; while the heating, condensing and vacuum power are, in every sense, replete and in fine symmetry with the gigantic dimensions and enormous capacity of the vessel; and as for workmanship, it is a fine specimen of the copper-smith's art.

PROGRESS OF WIRE CABLES.—The advance which wire cables are making and the way in which they are being rapidly substituted for ropes, chains and belts, has been frequently noted in these columns. We have now a report of some important trials of steel wire-rope hawsers which have been lately made at Portsmouth Dockyard, the results being such as to astonish the operators as to the enormous tensile strength which had been imparted to the wire. Steel is not only entering largely into the construction of our ships of war, but their standing rigging and hawsers are being gradually made of the same light and durable material, and in a short time the London *Times* expects that the present unwieldy chain cables in use will be superseded by steel wire cables of moderate thickness and weight. The recent tests at Portsmouth were of various samples of steel wire hawsers for towing purposes, it having been found from the experience of the *Valorous* and other ships that a wire hawser possesses equal flexibility to the best hempen rope, combined with less weight, superior handiness, and greater endurance, without any increase in the first cost. Official experiments at Portsmouth have also established the fact that the breaking strain of a steel hawser is more than three times that of a rope hawser. Thus a 9 in. ordinary hawser will break under a strain of 16½ tons, and a 19 in. hawser under a strain of 72 tons, whereas Bullevant & Co's 3 in. steel hawser broke at 18 tons, and their 6 in. hawser at 80 tons. In the matter of weight the advantage is also clearly on the side of the steel, the 3 in. and 6 in. wire hawsers weighing 7 lbs. and 29 lbs. per fathom, while the 9 in. and 19 in. hempen hawsers weighed 19 lbs. and 84 lbs. per fathom. The samples operated upon were respectively of the circumference of 3, 4, 5 and 6 in. The core of each was formed of tarred hemp, over which was twisted 6 strands, each strand being composed of 19 highly-tempered steel galvanized wires. The 3 in. hawser, which was formed of 15 gauge wire, broke at 22½ tons; the 4 in. 14 gauge, at 35½ tons; the 5 in. 12 gauge, at 57½ tons; and the 6 in. 10 gauge, at the enormous strain of 100½ tons. In every instance the strands parted at the splicing, which were the only parts displaying any appreciable elongation under the tests.

PROGRESS OF THE METRIC SYSTEM.—The Boston Society of Civil Engineers has the distinction of being the first organized professional body in the United States to make a systematic effort to secure the introduction of the metrical system of weights and measures into general use in this country. The society appointed a committee, whose duty it was to open communication with the various learned societies and leading manufacturers throughout the country, and secure the favorable action of Congress upon a memorial fixing a date for the official adoption of the metrical system, by the potency of a combined appeal from these influential sources. The report of this committee now before us, says the *Polytechnic Review*, after showing that the metrical system is steadily growing in favor in this country, states that 29 replies were received from societies which were addressed as above noted. Of these replies, 16 were favorable, 5 unfavorable and 8 undecided. On the unfavorable list, the American Academy of Arts and Sciences indefinitely postponed the matter by a vote of 10 to 8, on the ground that "it would be a hardship to deprive the people of their present standards if they preferred to use them;" and the Franklin Institute rendered its decision in favor of the sweeping statement "that the objections to the attempt to adopt the meter as a standard unit of linear measure are overwhelming." These two bodies are the most prominent objectors.

## SCIENTIFIC PROGRESS.

## Geometrical Chemistry.

We gave at the time of its first appearance a synopsis of a theory of a geometrical chemistry as proposed by Prof. Henry Wurtz. We notice now by the *Iron Age*, that the faculty of the Stevens Institute of Technology have paid a graceful tribute to American progress in science, by conferring the honorary degree of Doctor of Philosophy upon Prof. Henry Wurtz, A. M., for original research, and especially for the discoveries upon which he bases his remarkable theory of geometrical chemistry. As this is the first time the faculty have used the power to confer honorary degrees, and as the faculty, which includes such eminent scientists as Morton, Thurston, Mayer, Leeds and Wood were unanimous in the opinion that Prof. Wurtz's discoveries were of sufficient value to merit the highest honor in their gift, the compliment is one of which any man of science might be proud. Prof. Wurtz has discovered a great number of facts in relation to the mathematical relations of molecular volumes—facts which had previously been entirely unsuspected as well as unknown. The first point sought by Prof. Wurtz was a standard temperature of nature. This he very conclusively demonstrates to be the temperature of ice at the point of incipient fusion. This found, the first fact discovered was that the volume of all single chemical molecules with one exception, are expressed by quantities which have the relations of even cubes of whole numbers. The one exception is oxygen, the molecular volume of which, deduced from a comparison of water with peroxide of hydrogen, is 5,184, or three times the cube of 12. Calculations made upon the immense number of density terminations, fails to show that oxygen ever changes this volume—or diameter, as it is perhaps more appropriately called. Another discovery is the fact that hydrogen is the most variable of all the elements. It is found that molecules which combine to form a new substance, tends to assume very nearly the same size. Again, the tendency to vary increases with the electro-positive nature of the element. Later researches develop the fact that, in many different series of compounds, the diameter of some one element or elements vary in different members of the series by four units. The significance and importance of these facts alone are enough to render Prof. Wurtz's labors worthy of high honors.

MATING AMONG FISHES.—A writer in a Berlin contemporary contributes some details of his experiences in pike fishing, which tend to show that the idea commonly entertained that the removal of the male fish from a water about spawning time has less effect upon the stock than the capture of the females, is altogether erroneous. Four or five weeks before spawning commences the jack seek the neighborhood of the shore in groups, and he has invariably observed that each of these consists of one female accompanied by one or more male fish, and so continues, unless disturbed, till the breeding season is over. As a rule a female of small size is accompanied by one male only; a medium sized mother-fish has two or three males, and a full sized one as many as four or five. The larger the mother-fish the smaller, as a rule, are her attendant squires, the weight of the former being generally about equal to that of all the males put together. If the males of a group be caught shortly before spawning time, the bereaved female does not mate again that season; in due time of course she deposits her roe, but it remains unfertilized, and so perishes. By removal of some of the dorsal scales from all the members of the group taken in a net, so as to render their identification easy, it was found that on replacing them in the water at considerable distances from each other, they invariably reunited in a very short space of time. Under no circumstances was the spawn of a female bereaved of her attendant males, impregnated by the milt of others in the same water, however numerous the latter might be.

A NEW SERIES OF OBJECTIVES.—At the latest meeting of the S. F. Microscopical Society, a letter was presented from Charles A. Spencer, of Geneva, New York, which was received in answer to an enquiry about "Spencer's Objectives." Among other things Mr. Spencer writes: "From notices in the *London Microscopical Journal*, the *American Naturalist*, the *American Journal of Microscopy*, the *Cincinnati Medical News*, etc., it is quite evident that your Microscopical Society is a live one, and a gratifying fact it is to all devotees of science. I would give a cordial expression to the hope that its future progress may fulfill its present promise of being an honor to us all." In answer to an enquiry, Mr. Spencer gave a description of a new series of objectives he was working up, in which he has it as a special aim to produce "a series of objectives of quite moderate prices, yet of a high grade of excellence and of such almost absolute uniformity of quality that the purchaser need have no fear of disappointment in this respect." It is probable that the Society will have the opportunity of testing Mr. Spencer's new work. He is among the foremost of the optical instrument makers of this country; having made the telescope with which Professor C. H. F. Peters, of Hamilton College observatory, has discovered more asteroids than any other single observer, and a microscope for the late Professor Agassiz.

## Pitury—A New Stimulant.

We learn from *Nature*, that Baron Von Mueller in a recent letter to the *Australian Medical Journal* describes the origin of the Pitury, a stimulant said to be of marvellous power, and known to be in use by the aborigines of Central Australia. After years of efforts to get a specimen of the plant, he had obtained leaves, but neither flowers nor fruits. He can almost with certainty, after due microscopic examination, pronounce those of the Pitury as derived from his *Duboisia Hopwoodii*, described in 1861 (*Fragm. Phytogr. Austr.*, II., 138). This bush extends from the Darling river and Barcoo to West Australia, through desert scrubs, but is of exceedingly sparse occurrence anywhere. In fixing the origin of the Pitury, a wide field for further inquiry is opened up, inasmuch as a second species of *Duboisia* (*D. myoporoides* R. Br.) extends in forest land from near Sydney to near Cape York, and is traced also to New Caledonia, and lately by him also to New Guinea. In all probability this *D. myoporoides* shares the properties of *D. Hopwoodii*, as he finds that both have the same burning acrid taste. Baron Mueller adds: "Though the first known species is so near to us, we never suspected any such extraordinary properties in it as are now established for the later discovered species. Moreover, the numerous species of the allied genus *Anthocercis*, extending over the greater part of the Australian continent and to Tasmania, should now also be tasted, and further the many likewise cognate *Schwenkeas* of South America should be drawn into the same cyclis of research, nothing whatever of the properties of any of these plants being known. The natives of Central Australia chew the leaves of *Duboisia Hopwoodii*, just as the Peruvians and Chilians masticate the leaves of the coca (*Erythroxylon coca*), to invigorate themselves during their long foot journeys through the deserts. I am not certain whether the aborigines of all districts in which the Pitury grows are really aware of its stimulating power. Those living near the Barcoo travel many days' journey to obtain this, to them, precious foliage, which is carried always about by them broken into small fragments and tied up in little bags. It is not improbable that a new and perhaps important medicinal plant is thus gained. The blacks use the *Duboisia* to excite their courage in warfare—a large dose infuriates them."

NO BONES IN THE OCEAN.—Mr. Jeffrey has established the fact that bones disappear in the ocean. By dredging, it is common to bring up teeth, but rarely ever a bone of any kind; these, however compact, dissolve if exposed to the action of the water but a little time. On the contrary, teeth—which are not bones any more than whales are fish—resist the destroying action of sea-water indefinitely. It is, therefore, a powerful solvent. Still, the popular opinion is that it is a bribe. If such were the case, the bottom of all seas would, long ago, have been shrouded by immense accumulation of carcasses and products of the vegetable kingdom, constantly floating into them. Dentine, the peculiar material of which teeth are formed, and the enamel covering them, offer extraordinary resistance to these chemical agencies, which resolve other animal remains into nothingness. Mounds in the West, tumuli in Europe and Asia, which are believed to antedate sacred history for thousands of years, yield up perfectly sound teeth, on which time appears to have made no impression whatever.

MEXICO.—We are pleased to receive a sample of what our sister republic of Mexico is doing in the way of increasing knowledge of her development and resources of different kinds. Last February there was issued the first number of an official periodical entitled "*Anales del Ministerio de Fomento*." This branch of the government has cognizance of all internal improvements, both of public and private expense, and all scientific exploration to ascertain the topography, geography and various resources of the different Mexican States. The publication of information of this valuable nature under the approval of the government, carries assurance of its accuracy and trustworthiness, and will be hailed with pleasure by many who are waiting for more knowledge of the Mexican republic; believing that the country is indeed a cornucopia in nature as well as form. The first numbers of the "*Anales*" show that the work of making the country known to her own citizens and foreigners is to be done scientifically and creditably. Our acknowledgements are due to the Hon. Riva Palacio for copies of the "*Anales*."

GIANT POWDER IN ARCTIC EXPLORATIONS.—The accounts of the English Arctic expedition under Capt. Nares, show the application of many devices supplied by the advancement of science in overcoming the many obstacles presented by nature to guard the approach to the pole. Electricity made day of the five months of night, while dynamite opened the way through heretofore unsurpassable ice barriers. Cartridges of dynamite were simply placed upon the surface of the ice and their explosion was sufficient to clear a passage. Where large masses of ice were encountered, mines were dug, the cartridges placed therein, and the passage choked up with ice blocks so as to increase the effect of the explosion. By simultaneously exploding a number of these mines, open tracts for the passage of the vessels were easily obtained.

The woolen goods commission firm of Thomas & Co., of New York, have failed for \$500,000.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

## ALAMEDA.

**NEW COAL MINE.**—Alameda Independent, July 23: In the hills east of Mission San Jose there seems to be evidence of the existence of coal mines. Along the upper portion of Alameda creek, four or five miles beyond Sunol, Patrick Guay has been boring a tunnel for some months past into the solid rock in search of coal. He has run a distance of 70 feet already, and found a vein of coal four inches thick. It is of excellent quality and burns well—better even than the Livermore coal. Old coal miners think that by going 70 feet deeper a well-developed good-sized vein will be found.

## AMADOR.

**A BIG FIND.**—Amador Ledger, July 23: Last week the gravel claim of Wheeler & Bradshaw surrendered the largest chunk of gold ever found in the neighborhood of Folsom. It weighs a trifle over 33 ounces, and is estimated to be worth about \$500. A Mexican also picked up a nice little chunk of the coveted metal on another claim, in the same locality, a few days ago. These cheering discoveries would tend to stimulate mining industry at the grove were it not that the water has given out. As it is, things are at a standstill, and must remain so until the fall.

**DOYLE CLAIM.**—Work was started on the Doyle quartz claim, at Hunt's gulch, this week. Three or four men are employed sinking the shaft. A good sized vein of decomposed quartz is met with, which prospects well. It is intended to sink to the depth of 80 feet and then drill into the hill.

**BUNKER HILL.**—A correspondent sends us the following: Bunker Hill is showing more than the usual quantity of good ore in the under stopes of the 170-ft level and also in the 350-ft level. It yields a steady revenue each month.

**GOVERN.**—In the Govern mine, the immense body of ore above the 700-ft level began settling last Saturday, and it required all the skill of foreman Philip Oates to prevent serious consequences. A section of the ore body, of about 300 or 400 tons in weight, broke away and threatened to go through the 700-ft level, but timely and energetic action prevented harm.

**PLYMOUTH.**—Vaughn & Co. will commence sinking the shaft on their quartz claim this week. This claim is located on the west side of Indian creek, near the Cosumnes river. The rock has paid as high as \$20 per ton. The outlook is for brisk times in the development of quartz claims in this section. Samuel Cupps & Son have a quartz claim, which they are now working, located north of Dry creek, about one and a half miles east of Plymouth, for which they have been offered \$2,000. Very little work has yet been done, and the offer of \$2,000 is simply for the prospect of a paying mine.

## ALPINE.

**CONCENTRATORS.**—Alpine Chronicle, July 23: On Wednesday last two concentrators, for the Advance mill, arrived, and will be placed in position next week.

**ILLINOIS-CALIFORNIA.**—Good work is being done on the mine, and the tunnel measures 1,200 feet.

**SUNNYSIDE.**—The tunnel of this mine is in 235 feet.

**S. L. SINKING.**—At the rate of 11 feet per week and drifting 40 feet.

**SILVER CREEK.**—Tunnel of the Silver Creek in 105 feet.

## BUTTE.

**THE MINES ON BUTTE CREEK.**—Butte Record, July 23: The incontrovertible fact remains patent to every eye that the hill diggings of the Butte mill will not yield the vast stores of mineral that are known to exist here, unless there is a ditch of water brought from the canyon upon the hills, so as to use the hydraulic process. There are more men on the creek this year than we have known for a long time. Messrs. Striker & Morice are bringing a ditch from Texas bar, which will cover all the intermediate bars and benches between Cooke's and Centerville in the east side, which will afford employment for a great many men. Malby & Reister, on Paradise Flat, have plenty of ground that will pay good wages for years. Some of the river claims are paying well, but the hills remain unworked for want of water.

## CALAVERAS.

**TUNNEL TO BE ANCHORED.**—Calaveras Chronicle, July 23: The water company have determined to arch the tunnel that perforates Cape Horn ridge, through which the flume is laid, to prevent its caving during the rainy season. The rock through which the tunnel is dug slakes and caves in wet weather, and has been the occasion of a good deal of trouble and expense. A road has been built to the tunnel, and the shaft with which it is to be arch is now being hauled. When encased with substantial masonry, all further trouble will be obviated.

**OWIN MINE.**—The shaft in the Owin mine has reached a depth of 75 feet, work progressing rapidly and favorably. Scarcity of water prevents the running of more than 16 stamps, and it has become necessary to employ steam in pumping.

**ROCK CUT.**—Gass & Co., at Mosquito gulch, have out about 60 tons of good rock, which will be shortly hauled to Orland's mill and crushed.

**MACHINERY ARRIVED.**—A portion of the machinery belonging to Garland's new mill, in Chile gulch, has arrived upon the ground, and the remainder of it is daily expected. The mill will be in readiness for operation by the time water is obtained.

**MOSQUITO GULCH.**—Times are quite lively in Mosquito gulch. The mining interest is flourishing and business of all kinds is looking up. We hear it stated that arrangements have been perfected by which the well-known San Bruno, Good Hope and Vance mines are to be brought under one proprietorship and systematically worked. It is capital to put them in proper shape for working to advantage and furnishing the machinery necessary. The mines mentioned can be made largely and permanently remunerative.

## INYO.

**REX MOUNTS.**—Coso Mining News, July 23: Last Wednesday there passed through here, per Wells, Fargo & Co.'s express, four bars of silver bullion from the Rex Mount mine, situated at Independence, in this county. The aggregate value was stated at \$1,000.

**DEFIANCE.**—In the last few days about 250 tons of ore have been delivered at the furnace dumps of the Defiance, and it now looks as if the furnace would start up sooner than we predicted in our last issue. Work on the mine is being driven rapidly ahead, the indications in the drift to strike the back ledge improving with every foot gained.

**EMIGRANT BULLION.**—Last Saturday afternoon, Peter Taylor, Superintendent of the Emigrant company's mines, at Lee district, brought in and had shipped by express two bars of silver bullion, aggregating 1,500 ounces. One bar of bullion was 850 fine, the other 950 fine. This was the result of 72 hours run of five stamps and only a partial clean-up being made, there being some \$300 worth of amalgam still in the pans. Taylor says the result is very satisfactory indeed, and Mr. Smith, the mill man, says he never worked freer ore. The mill is now running splendidly, there being plenty of water. There is plenty of ore on the dumps and more daily being developed in the mines.

## NEVADA.

**NEVADA CLEAN UP.**—Nevada Transcript, July 26: The Manzanita company made a splendid clean up a few days ago. They took out two hundred and eighty pounds of amalgam, which was valued at over \$35,000, or \$125 per pound. In the sluice several pieces of rock were seen that contained about one-half an inch of gold on the surface, and it was expected the run would be one of the

best made this season, and they were not disappointed. This mine is situated at Sweetland, and is owned by the Milton mining and water company, and is one of the very best in the county. This clean up was from a twenty-five-days run, but in reality only about twenty full days were consumed. In this mine they employ only about 25 men, and of course the labor expense is not very large. They have ground enough to last for 15 or 20 years to come, and an unusual small amount of ground was worked at this clean-up to produce the above result. The mine has been fitted up in the most perfect manner, and is worked perhaps to better advantage than any mine in Bridgeport township. Arrangements are now being made to put in a drilling machine, to be run by an air compressor similar to the one in use at French Corral. Richard Thomas, one of the best mining Superintendents in that township, has charge of the mine, and is managing the affairs of the company in a very skillful manner. V. G. Bell, Esq., is the General Superintendent, and a large owner in the Milton mining and water company.

## PLACER.

**WATER.**—Dutch Flat Forum, July 23: The water supply is getting quite limited. The South Yuba Canal Company is now drawing from its lake. The ditch of the M. & A. Utah Company is dry; and that of the Cedar Creek Company has nearly only two hundred inches running in it. This company, however, has not yet commenced drawing from its mountain reservoirs, as the water stored therein is held in reserve, for opening up the B. & C. claim.

**THE ROSA STAR CLAIM.** has continued washing as constantly as circumstances will permit. The blast exploded in the du on the 23d of June did wonderful execution, loosening up an immense quantity of gravel which aided greatly in enlarging the size of its pit. This claim has an opening so large that work can be done to much better advantage than heretofore, and its prospects are improving rapidly.

**THE SOUTHERN CROSS CLAIM** exploded a blast of 400 kegs of black powder on the 23d of June, which covered the bottom of the pit and filled the shaft with boulders and gravel. A force of men have since been engaged in raising another shaft to the surface, which is just completed and is now ready to commence washing again. The sluices in the tunnel below are being cleaned up, after which it is the intention to take a fresh start and make a good run.

**THE BAKER CLAIM** exploded a blast of 12,000 pounds of Judson powder on the 11th inst., which loosened up gravel over an area of two hundred feet square. The chambers were situated on both sides and immediately in the rear of the shaft. Timbers were placed in the shaft about twenty feet below the surface, and covered with dirt and boulders for the purpose of preventing the shaft from being filled. From beneath these timbers an incline was raised to the surface of the bedrock, for the purpose of opening the shaft. The timbers in the shaft could not resist the concussion, and as was feared, the shaft was filled to the surface with gravel and boulders. A string of pipe, however, was soon laid up the branch tunnel below to the bottom of the shaft, and a stream of water turned on to wash the gravel and boulders away from below. This work has been carried on with vigor, and yet the water has not sunk very deep, and it is to be turned through its pipes until yesterday. The claim is now all right again, and washing to good advantage.

**AT GOLD RUN** everything is now quiet, the only claim running is one owned by Mr. Frank Sachs.

**TUR BIG BONANZA** (as the claim of the Miners Ditch Co. is called) has finished cleaning up since our last issue. This claim has been washing since the first of February, and is the only one that is doing any business. The iron for paving, as they have done, it is not necessary to clean up but once during the season, thus saving much time when water is abundant and time so precious. We have not been enabled to ascertain how much was realized but believe that the amount was large.

**MINING NEAR OPHIR.**—Placer Argus, July 23: Most of the mills in the vicinity of Ophir are now closed. The mine is the property of the St. Patrick mine, and a large number of men out of employment, and it is said that wages are considerably in arrears. The Eclipse mill is running on small jobs for various mines and prospectors in the vicinity. Pelster & Son, who own a quartz claim on Auburn ravine, and Mr. Salmons, whose claim is near Ophir, not far from the Greene mine, have joined forces in the erection of a new mill, which is nearly ready for use. The mill will use it mainly in the reduction of their own ore, though custom work will be taken if offered. The ore from the claims of both partners in this mill pays for working, and it is believed that by reducing it themselves more can be saved than heretofore. Salmons' claim is on an iron belt, containing copper as well as gold. The shaft is down over 50 feet. Pelster's is what is known as the same character of vein, which is quite uniform. The shaft is only 35 or 40 feet down. Peck & White, who are opening a claim near the ravine, about a mile east of Ophir, have a good prospect. This ledge is about four inches wide, and yields enough to pay expenses, though it is surrounded by an iron belt, which is very hard and difficult to work. This vein is two feet thick, and besides iron, contains copper and sulphur. The rock is of the same character as that in the Friday and Greene mines. The hole is yet only 40 feet deep; and as the ledge grows steadily richer, the owners have hopes of final success. They depend now mainly upon select pieces pounded out in a mortar. As soon as the value of the rock will warrant the expense, a tunnel will be run in from the bed of the creek.

## PLUMAS.

**STARTED UP.**—Plumas National, July 25: The new quartz mill at the Bell mine has been started up this week, and works like a charm. The mill is said to be among the best, if not the best, in the county, and the work on it is highly spoken of by those who pretend to be judges of such matters. We expect that the Bell mine will now prove itself a valuable one, and hope that the owners will find that they have invested their money in the right place.

**NICK MILL.**—On Thursday we took a look at the Bell mine, and were shown around by the Superintendent, Mr. R. Z. Bell. The mill runs splendidly. The machinery, under the charge of Mr. Sage, an engineer from Duquesne, seems to perform the duty without an effort, and everything in and about the mill seems to be convenient and practically useful. Mr. Pelton, of Campionville, who has charge of the building business, is certainly a first-class workman, and his work proves it. This mine, which is in charge of our old friend Harry Firmstone, looks first-rate. A cross-cut has been made from the tunnel, and it shows fully 20 feet of splendid looking quartz, besides a large body of vein matter, which carries more or less gold.

## SANTA BARBARA.

**GOLD.**—Santa Barbara Index, July 26: A good deal of excitement has been created by the recent discovery of gold mines about 10 miles from town in the mountains just above Montecito. The gold is found in decomposed sulphates of iron, free from any base metal, and very easily worked. One ton was brought to the mill, and yielded 87½ ounces of the ton gold and \$9 silver. This, if the mines are at all extensive, will give the owners an immense profit, as the rock can be worked for less than \$5 per ton. The same parties have also discovered, it is said, a tin mine, one that will yield \$40 to the ton. If this be true, it is a fortune of itself, as a reward of something like \$150,000 is offered by the U. S. Government for the discovery of a tin mine in the United States that will pay \$18 per ton.

## SIERRA.

**STILL RICH.**—Mountain Messenger, July 23: On Monday last a piece of rock weighing 50 ounces was taken from the North Fork claim. When it was pounded out it yielded exactly 45 ounces of gold. Nine parts gold to one of rock is pretty good.

**GOOD PROSPECTS.**—Dick Williams and Henry Hartling are reported to have struck good prospects somewhere on Thompson ridge.

**AT WORK.**—The Bald Mountain company, after the stoppage of a week, has resumed work.

**TEASO.**—Ward & Brown are making tubing for the Ploocene shaft, and the work of sinking will be commenced immediately.

**PROSPECTING.**—A party of miners from Virginia City, among whom we notice Messrs. R. Jackson, Absalom Wilson and Anthony McKay, old residents of Eureka, are now prospecting in the vicinity of Saddle Back for gravel and diggings. They will also look after some quartz ledges. We are glad to see some of the old miners working back. This is one of the best counties in the State to prospect. A couple of prospectors from below are running a tunnel to prospect the quartz ledge formerly owned by Sam Hartley, just above Jenkins' bridge, half a mile above this place on the South fork. They have started their tunnel at the edge of the river. Sam found some excellent rock in his tunnel above.

## TRINITY.

**LARGE SALES.**—Trinity Journal, July 23: Two large pieces of property have changed hands recently, the Hocking brothers having disposed of their claims and water right, and the W. D. & H. M. Co. of the Sidney gulch and hill property. The purchasers in each case were Chinese. We can't say that the general public will receive any benefit from those transactions. Chinese are not a very desirable kind of population, and the community could expect to reap more benefit if the claims had been retained under the ownership of white men.

**RICH.**—Late specimens from the Deadwood quartz district show much free gold.

## TUOLUMNE.

**BIO GERSE.**—Tuolumne Independent, July 23: As an old German, known by many as "Old Charlie," was looking over some old tailings, near John Victor's ranch, Shaw's Flat, he saw a small piece of gold, and in picking it up, it fell down among the rocks, removing some of the dirt he came upon a piece weighing 17 ounces solid gold. The piece looks as if some one had thrown a ladleful of molten metal upon the ground. It evidently came originally out of Table mountain, and must have been forked out with the rocks from the sluices where the claim was worked some years ago.

**MINING ENTERPRISE.**—Mr. Leachman, of the Solsby, is opening out the Draper mine, which is considered by most reliable parties as being the richest in the county. Mr. Leachman being anxious to see the bottom of the Draper, has concluded to take the water out with barrels and not wait for pumps and iron work which will connect it with the water wheel. He has also commenced opening out the Louisiana, and from reports this property will prove to be one of the first-class mines of the county. He is also pushing the Ferguson with vigor and building a large wheel to carry the works.

## Nevada.

## WASHOE DISTRICT.

**COS. VIRGINIA.**—Gold Hill News, August 1: Daily yield, 500 tons of ore, keeping the mills crushing to their full capacities and insuring the payment of the regular monthly dividend of \$2 per share. The ore stopes on the 1000-ft level are opening out splendidly as the extraction of the ore progresses southward. Sinking the double winze below the 1550-ft level is making fair progress, the entire bottom being again in good ore. The flow of water in this winze, which heretofore has given some trouble, appears to be gradually lessening. The main south drift on the 1550-ft level is being pushed ahead and enlarged to create a better circulation of air. The ore stopes on the 1000-ft level are opening out splendidly as the extraction of the ore progresses southward. Sinking the double winze below the 1550-ft level is making fair progress, the entire bottom being again in good ore. The flow of water in this winze, which heretofore has given some trouble, appears to be gradually lessening. The main south drift on the 1550-ft level is being pushed ahead and enlarged to create a better circulation of air. The ore stopes on the 1000-ft level are opening out splendidly as the extraction of the ore progresses southward. Sinking the double winze below the 1550-ft level is making fair progress, the entire bottom being again in good ore. The flow of water in this winze, which heretofore has given some trouble, appears to be gradually lessening. The main south drift on the 1550-ft level is being pushed ahead and enlarged to create a better circulation of air. The ore stopes on the 1000-ft level are opening out splendidly as the extraction of the ore progresses southward. Sinking the double winze below the 1550-ft level is making fair progress, the entire bottom being again in good ore. The flow of water in this winze, which heretofore has given some trouble, appears to be gradually lessening. The main south drift on the 1550-ft level is being pushed ahead and enlarged

## THE ENGINEER.

## Berlin Pneumatic Dispatch.

We read in the *Journal of the Franklin Institute* that the proposed pneumatic dispatch in Berlin embraces 26 kilometers of tube, and has 15 initial stations. The wrought iron tubes have a clear breadth of 65 millimeters, and lie about one meter below the surface of the ground. The letters and cards which are to be forwarded have a prescribed size, and are enclosed in iron boxes or cartridges, each of which can hold 20 letters or cards. In order that they may pack closely, they are covered with leather. From 10 to 15 cartridges are packed and forwarded at a time; behind the last cartridge is placed a box with a leather ruffle, in order to secure the best possible closure of the tube. At four of the stations are the machines and apparatus needed for the business. The forwarding of the boxes is effected through compressed or rarefied air, or through a combination of the two. Steam engines of about 12-horse power are used for the condensation or exhaustion of the air. Each main station has two engines, which drive a compressing and an exhausting apparatus, the steam for each engine being furnished by two boilers. Large reservoirs are employed, both for the condensed and for the rarefied air. The former has a tension of about three atmospheres; the latter of about 35 millimeters of mercury. The air, which is heated to 45° C. by the compression, is cooled again in double-walled cylinders which are surrounded by water. The velocity of the boxes averages 1,000 meters per minute, and a train is dispatched every 15 minutes. Each of the two circuits is traversed in 20 minutes, including stoppages. The entire cost of the enterprise will be about 1,250,000 marks.

**MECHANICAL ENGINEERS.**—Mechanical engineers seem to be better appreciated on English railroads than on ours, says the *Railroad Gazette*. In connection with a notice of the appointment of a successor to Mr. Joseph Armstrong, late Chief Locomotive Superintendent of the Great Western railway, it is stated that the salary of the position is £1,500 a year—equivalent to a little more than \$7,500 in our currency. Moreover, after Mr. Armstrong's death, the company voted his widow a gratuity of £1,000. No master mechanic in the United States, it is safe to say, gets a salary anything like this. Very likely, too, some of our roads would be better off if they had a \$7,500 man at the head of their mechanical department—if they could find one. Certainly it cannot be expected that the best talent will devote itself to or remain in this department (where first-class ability is so much needed), unless it offers some great prizes as well as many little ones. Too many railroad companies seem to regard master mechanics as intelligent blacksmiths, who ought to know how tools are used but have no great need of brains or education. They are not, in the long run, likely to get much better material than they ask for—and pay for.

**AN ENGINEER HONORED.**—The *New York Engineering Journal* learns that the Emperor of Germany, in acknowledgment of the services rendered to German engineers visiting this country, by Mr. William G. Neilson, Secretary of the Centennial Committee of the American Institute of Mining Engineers, has conferred upon that gentleman the fourth class of the Royal Order of the Red Eagle, the decoration of which (a handsome silver Maltese cross, ribbon, etc.), together with a suitable letter from Baron Thielmann, the German charge d'affaires at Washington, came to Mr. Neilson's hands last week. This graceful recognition is in keeping with the cordial spirit in which the German government and its representatives have from the beginning accepted the courtesy and assistance, which the institute was able to render. Mr. Neilson was, however, far more than a mere official representative of the institute. It is not too much to say that he made himself the personal friend of every guest of the institute who needed his services, and that he deserves a large part of the credit which the successful execution of the plans of the Centennial Committee has reflected upon the society.

**RAILWAY THROUGH EDEN.**—The scheme of making a shorter route to India, by constructing a railway along the valley of the Euphrates, appears to receive a good deal of attention at present. The project is no doubt a fascinating one, but the difficulties in the way of such an undertaking are, however, enormous, if not insuperable. That the line, if accomplished, can be anything more than a military road for British troops, few who know anything of the country will contend. The climate may be described as deadly, and what was once a vast fertile garden, teeming with life and industry, and having a magnificent system of irrigation, is now an arid waste, traversed only by bands of plundering Arabs.

**CANADIAN CANAL.**—The work on the Welland canal, enlarging it to the capacity of vessels of the largest class, will not be completed before the fall of 1879. When completed, it will have locks 278 feet long and 45 feet wide, with 14 feet depth on the sills, the canal proper having a width of 100 feet at the bottom, with a depth of 15 feet. Vessels of over 2,500 tons burden will be enabled to pass through.

## Asiatic Railway Routes.

From the journal of the Vienna Imperial Geographical Society, 1876, we see that M. Hochstatter, the President, has recently published a brochure on these routes, some of which projects are as follows. They will give our engineers a chance to study the magnificent in projecting:

1. Baranowski project.—Point of departure, Saratow; direction across the country of the Triguises, the length of Amou-Daria across the Hindoo Couch, which would be the shortest line from Moscow to Peshawer.
2. Project.—Lesseps-Cotard; from Orenberg to Peshawer by Orsk, Tachkend, Chodchend, Samarcand and Balch.
3. Project.—Bogdanowitch, frontier of Siberia stations, Moscow, Cazan, Catherinobour, Onisk, Tonisk, Irkuck, Tchita, Dalai-Noor, Peking.
4. Project.—Ruhthofen; junction with the route of Siberia to Onisk (Semipalatinsk), Sugipol, defile Kastew, Tachkend, Chodchend, Samarcand and Balch. At this last point the route turns toward the west by Wechek and Teheran to join at Tiflis, the Russian Caucasian *Reseau*, presently in course of construction. Last geological explorations have proved the existence in Central Asia of immense depots of *Combustible fossils*.

**FAST TRAINS SUGGESTED.**—The *Railway Age* says it has been suggested, and not without some reason, that the Union and Central Pacific Railroad Companies might imbibe a little of the fast train mania to real advantage. At present the time spent by the express train from Omaha to San Francisco is something over 102 hours for the 1,916 miles, or an average of a little over 19 miles an hour. If the speed was increased to an average of 25 miles, the long journey would be reduced fully twenty-four hours—a very important saving to travelers on business, and one that would not be at all unwelcome to pleasure tourists. It is true that a considerable part of the distance is over heavy grades, but there is also a very large proportion of level road, and the proposed time could easily be made—especially on the completion of the loop line from Bantuas to Oakland, which will save about two hours over the present route. Of course the increased speed would be somewhat more expensive, but it might pay nevertheless. Certainly if another transcontinental line is ever opened we shall be likely to see the present line shortening up its time-table, and it is not impossible that the trip from the Missouri to the Pacific may yet be regularly made in two days and a half instead of nearly four and a half as now.

**THE OLD CABLE.**—An English paper says: "Persons interested in cable companies will be astonished to learn that there has just been picked up in mid-Atlantic the long-lost cable which was laid by the Great Eastern steamship twelve years since. The successful laying of that cable was hailed with rejoicings in the New World and the Old, for though an earlier cable had been partly laid, the cable of 1865 was the first which had actually transmitted a message from the other side. But that cable soon broke, and was completely lost for the time. The Telegraph Construction Company sent a steamer recently to fish for the old cable, and a message received through the identical line the other day states that the cable has been recovered in the middle of the Atlantic in good condition. The Anglo-American Company intend to have the line completed and got to work as soon as possible, and this will make the fourth cable of the Anglo American Company."

**RECLAMATION OF LAND IN MORECAMBE BAY.**—A scheme has been originated, says *London Iron*, and is in fact being carried out, under the auspices of the Warton Land Company, for the reclamation of about 10,000 acres of land from Morecambe bay, by the construction of a sea wall to extend from Hest Bank railway station on the London and Northwestern railway to Arnside point. It is proposed to construct a drive between Morecambe and Arnside, and the possibility of a railway connection across the new bank is talked about. When this work is completed the distance between Lancaster and Barrow will be reduced by 10 or 12 miles. The estimated cost of the work is £150,000, and it is thought the land when reclaimed will represent a value of £400,000.

**LIGHTING TUNNELS.**—We learn that the managers of the Hoosac tunnel are considering the feasibility of lighting that great subterranean work, so as to remove the gloom attendant on a ride of thirteen minutes through its blackness of darkness, and to give the traveler a better idea of this wonderful passage, four and three-quarter miles long, hewn through the mountain at a cost of nearly \$17,000,000. The problem of lighting so vast a gallery throughout its entire extent is a difficult one and will require some study.

**COSTLY BRIDGE.**—The trustees of the Brooklyn bridge, crossing East river, between New York and that city, at their meeting on July 24, stating that thus far \$7,557,135 have been expended upon the bridge, the balance on hand being \$154,147. Two strands in the bridge cable were completed July 24, containing respectively 324 and 326 wires. The only other bridge in the United States as costly as this is the great railroad bridge across the Mississippi at St. Louis, in which about \$10,000,000 are invested.

## An Army of Miners.

A *Chronicle* reporter was detailed a few days ago to ascertain as nearly as possible the number of miners employed on the Comstock. The following figures, which were furnished by the accountants named, are accurate. The names of the companies are stated in the order in which their claims occur on the lode:

Utah.....	46
Sierra Nevada.....	120
Union Consolidated.....	25
Mexican.....	42
Ophir.....	222
California, Con. Virginia, C and C shaft.....	1160
Best & Belcher.....	27
Gould & Curry.....	100
Savage.....	100
Hale & Norcross.....	54
Chollar and Combination Shaft.....	110
Bullion and Exchequer.....	50
Imperial.....	74
Yellow Jacket.....	168
Crown Point.....	87
Belcher and pump shaft.....	220
Overman.....	70
Caledonia.....	40
Justice.....	59

The Julia, which is located on the problematic "east ledge," employs 32 men.

The above, although it includes all the mines on what is recognized as the Comstock lode, is by no means a full report of the number of men employed at mining in the neighborhood. There are many smaller claims which give employment to from two to ten hands, which are not mentioned at all. Setting the total of such at 150, it will be seen that the whole number will reach 3,156. Of this number, exactly 1,800 are employed in the Utah, Sierra Nevada, Union Con., California, Con. Virginia, Best & Belcher, Gould & Curry, Savage, Hale & Norcross and Yellow Jacket mines, which are now controlled by the honanza firm; 806 are employed in the Mexican, Ophir, Chollar, Combination shaft, Imperial, Belcher, Overman and Caledonia—controlled by the Sharon or Bank of California party, and 641 in the Bullion, Exchequer and Justice—controlled by the Schultz & Von Bargen party.

The labor prospects are improving slowly, as some of the mines are continually adding to their working force. For instance, although the Ophir, since their last pay day, has reduced its force by about 30 men, the honanza companies have added about 150 to their working force; so that the number at present employed is really above that stated in the table, as the figures there given were taken from the last pay rolls. Within the next 30 or 40 days, the Wells Fargo, Phil Sheridan, North Con. Virginia, Ward, Alpha, Knickerbocker, Baltimore Con., Silver Hill, Dayton, Kossuth, and a score of mines of lesser note, will probably be started up again.

The figures above stated do not include the men employed in and about the mills.—*Virginia Chronicle*.

## Pike City Gravel Mines.

A correspondent of the *Mountain Messenger* (Sierra county), writes as follows from Pike City:

While other localities have been busy puffing themselves on paper and finally bursting, like the toad in the fable, we of classic Pike have been modestly standing on our conscious dignity waiting for our worth to be appreciated, and in consequence have been almost forgotten even by the candidates for office, whose memories are so long and who "love the people all so dearly."

This ridge is the divide between Oregon creek and the Middle Yuba, and there is a comparatively level strip of from one to two miles wide on the top of the ridge. Along this strip are scattered the ranches; foremost in size are Wayman's, Harris's, Clerkin's, Robinson's, Nelson's, Houghton's and several smaller ones. The principal products are hay, potatoes and hutter. There are many indications of prosperity among them showing that a mountain ranch does pay, for instance, the building of new barns and adding to their flocks.

The formation is much similar to the generality of the southern part of the county, except in the number of talcose veins. These veins are very numerous, and cut through and across the formation in as clear and defined a manner as any quartz ledge. In many places they carry gold in paying quantities, generally in streaks of quartz running in every direction through the talc. The quartz ledges have been very little prospected around here, and none except the Alaska to any depth. This mine has been worked to a depth of 225 feet from the croppings and paid big. There was good rock in the bottom of the lower level, but the pump-machinery had got too light to go down. At this time the nine changed hands and the new owners essayed to make it pay by increasing the battery from five to ten stamps, and going after top rock. Since that time the mine has been idle most of the time, except as Mr. Marriott has taken out some patches of ore under a lease, and used the mill part of the time as an artist's studio.

The placers were in early days very rich both in rough and washed gold. They consisted in shallow gulches which were easily exhausted, and then re-exhausted by the Chinese. The class of surface miners who worked out the section of the country, left as soon as the rivers were worked, without much search for the source of gold they found in the grass-roots

and the few who remained turned their attention to ranching.

On the Oregon creek side, is a ridge of gravel mixed at the surface with some quartz boulders. In this ridge the gulches near Pike City all head, and here they probably got their washed gold; yet, for two miles I do not think there is a tunnel or shaft on the ridge. What we want is a revival, and it will surely come. Mining is epidemic, and when it breaks out in a locality everybody goes there and begins to prospect in all the reasonable and unreasonable places, and in consequence several good mines are always found soon after some emigrant blunders on good pay.

## A Marvelous Winze.

There is a great mine on the Comstock. It has for some years been a matter of deep concern to many people. We may say the concern commenced when people had loaded up on margins at \$243, and suddenly the bottom fell out. That bottom was the matter then; it seems to be yet. The story goes that some 10 days since a winze was being sunk, when the same treacherous body showed painful signs of a change to a formation which is not considered the best for holding treasure. Then the work was stopped. With laborious effort water—though water is scarce—was brought and the winze was filled to the depth of five feet. Just then a prominent expert was desirous of visiting the mine. On the top he was told about the winze and the sudden inflow of water. The account was rendered in a tone of regret, which did not succeed in concealing the sorrow of the managers that such an unlooked-for obstruction should come up in their path. But to show him what would have been but for the catastrophe, he was lowered down to the top of the winze; a brave miner was armed with a giant cartridge, and was besought, if possible, to get some ore from the very bottom. He was a good miner, the charge was successfully exploded, and, on his second journey, the miner, out of five feet of water, brought up the ore. The expert who had waited, clutched it, assayed it and reported by telegraph that it was three hundred and odd dollars at the bottom of the wet winze. The stock went up \$2.50 per share and was steadily advancing when it was discovered that the treacherous bottom had deceived the people again—the water had seeped away. This was too bad. When the story was reported to a distinguished Superintendent, and he was asked what would be a fair conclusion of the whole business, he said it was the most ungrateful winze he ever heard of; that the mistake was made in using water; that in Justice to the mine lager beer should now be tried. There is no point to the above except that it is vouched for as true and reveals a system which we thought was confined to White Pine in the early days, when a Superintendent there asked a man, whom he caught stealing Eberhardt \$30,000 rock, if he could not get along with less than a full sack. "Not a d—d ounce less," was the reply; "I have got to sell a claim with this sack of rock."—*Virginia Enterprise*.

## Osceola District.

The *White Pine News* says: At Osceola, the five-stamp mill of Wagner, Peck & Co. is constantly working on Exchange ore with satisfactory results. Our informant rode some six hours over the district and saw a number of good leads; principal amongst them are the Cumberland, which is a five-foot vein, owned by Mr. George Blair, who, several years ago, worked his mine with an astra, making it pay. This was before the placers were struck. Other promising mines are the Exchange and Golden Eagle, owned by Mr. James Mattison, the former being leased by the mill company. The Woodman, owned by Peters & Irvine, and the Gilded Age, owned by Watson & Barrows, are well-defined ledges, about four feet wide, and show free gold to the naked eye. The fact that every little gulch around will pay wages in coarse gold is inducement enough to develop this district. Some of these gulch claims are paying well. Wizer & Chappel are making \$12 per day to the man, and a number of miners are taken out from \$6 to \$7 per day. Others make good wages by cleaning up the bedrock and packing the dirt to water. These gulch claims extend about five miles in length and would pay big for one season if a good stream of water was convenient to the camp. There is a scope of country, about four miles wide by six in length, in which appears principally quartzite, with an under strata of slate and some porphyry, the general direction of the country rock being north and south, while the quartz veins cut the same at an angle bearing about 20° south. The place has already attracted the attention of capitalists, and Mr. Sam Ferguson, a mining expert, has spent several days in examining the mines. The business of the town of Osceola is represented by two saloons, two restaurants, two butchershops and one store. Many old White Piners are located there, and vie with others in the description of their claims. Several of the natives were asked the population of the place, but they varied from 150 to 500. There are probably 100 men in the vicinity. A good road leads from Osceola to Snake valley, from which are brought new potatoes, fresh vegetables, trout and other delicacies.

## Mining at Iowa Hill.

A correspondent of the Dutch Flat *Forum*, writing from Iowa Hill, says: Our mining interests promise to have an impetus given them this summer, such as they have not had for a long time during the dry season. First I will speak of the

## Succor Flat Claim.

This is an old claim, under new and extensive operations, being now the entire property of Mr. Weske, of Michigan Bluffs, who has spent a large sum of money to put the claim in its present condition. Two tunnels are being run simultaneously; the lower one is already 900 feet long, and intended for general working purposes; the upper one, which commences at the chute connecting the two, is about 170 feet long, and intended eventually to secure good air. From the upper tunnel, some gravel, for the first time under this management, has recently been washed, and though not rich as of old, may still be considered satisfactory. The larger pieces of gold are mixed with quartz, and quite rough, as though just broken from the parent ledge, so it is probable this gold does not come from the old channel they are seeking to strike. In richness, also, this gravel bears no comparison to that washed years ago by the original owners, before they lost the bottom in their slope and were driven out by water. The rock, however, is dipping rapidly in the upper tunnel, and things look as if they had not much farther to run before the old rich pay is again reached. It is to be hoped this will prove so, for the claim is very important to the district, representing as it does a large tract of unprospected ground. The outer works, consisting of shops, sheds, tracts, dumps and flume, are allowed to be the largest and most substantial in the county, and at a rough estimate must have cost \$4,000, while a similar amount must have been expended on the inside works.

The next feature of improvement during the summer will be fixing up the

## Orion

For the pipo. This is a large hydraulic claim, situated at the entrance of the town, on the Colfax road; and, though worked successfully in past times by tunnel, has been in abeyance for years. Like the Succor Flat claim, though in a different way, the Orion will have an immense influence on our future. It is not only a very large claim, comprising, I believe, the whole of Sugar Loaf hill, but possesses unequalled facilities for extensive washing on both the river and Indian canyon side. Mr. Macy, one of the owners, and a deservedly popular man in our section, has taken the contract at \$5,000. This fact assures us the work will be done thoroughly. When in full operation the Orion will be quite a feature among our big mines, while its developments will do much to establish our prosperity in future, beyond reverse.

The next and last item is the sale of the old Rough and Ready claim, situated at Grizzly Flat, between two and three miles from Iowa Hill. Report fixes the figure at \$2,200. In connection with our general interests and future reputation, it is almost impossible to over estimate the importance of this sale. The claim originally bore a high reputation; but, owing to disagreements among the owners of the day, the large works were dismantled and the ground left idle up to this date. As stated, the present owners, Mrs. Liddell and Mr. Geo. Hazelroth, have sold to Messrs. Powers, Cameron and Jurgenson, owners of the Hidden Treasure at Sunny South, one of the crack claims of the county. If the warmest friends of our district had had the choice of purchasers they could not have made a better selection. These gentlemen have not only the means, but they have the true mining intelligence, enterprise, and courage to make the undertaking an immediate success. In fact, I do not know where to limit reasonable expectations from this sale. Although extremely rich in olden times, neither the precise course nor extent of the channel northward, which the claim commands, had ever been actually determined. Sufficiently defined ideas, however, of both exist from past experience to justify a prediction of developments which must have an immense influence on our future. The secret we have long wanted know, and which a revival of the Rough and Ready will disclose, is the precise course and character of the enormous channel which beyond all question intersects this particular territory. Does it extend to the Mohawk, four miles to the north; will it eventually, in that direction, connect with Succor Flat; has it diverged to Prospect hill, a mile and a half to the west, or did it preserve itself unbroken, and pass by Rough and Ready to the junction of the Big and Little Grizzly canyons, two miles to the south? Here then, we have a territory six miles long, and a mile and a half wide, giving unmistakable evidences throughout of an immense channel, and rich wherever hitherto touched, to be definitely explored by the operations of this new company. Have I attached too much importance to a revival of the old Rough and Ready; to my anticipations of good to spring from its reopening in a manner that will solve this great problem? I have every confidence in the natural evidences before us; I have equal confidence in the men who are now going to grapple with those evidences; and, in the two, I feel safe in predicting a speedy emergence of our district from stagnation and idleness, to the wealth and activity of your own surroundings. Such are the prospects the present summer offers, the best of prospects, employment for the working man.

## USEFUL INFORMATION.

## Removal of Stains from Woven Fabrics.

The following practical hints on this subject, condensed by the Boston *Journal of Chemistry* from the best foreign sources, furnish much useful information in small space:

Mechanically attached particles may be removed from all fabrics by beating, brushing and allowing water to fall from an elevation upon the wrong side of the goods.

Mucilage, Mucus, Sugar Jelly. — Washing with lukewarm water will clear all goods.

Fats. — From white goods: Wash out with soap and lye. Colored cottons: Wash with lukewarm water and soap. Colored woollens: Lukewarm soap and water or ammonia. Silks: Clean carefully with benzole, ether, ammonia, magnesia, chalk, clay or yolk of eggs.

Oil Colors, Varnish, Rosin. — From all fabrics, except silks: Oil of turpentine, alcohol, benzole, and then soap. Silks: Benzole, ether, and soap very carefully and in a very weak solution.

Stearine can be removed from all goods with strong, pure alcohol.

Vegetable Colors, Red Wine, Fruits, Red Ink. — From white goods: Sulphurous vapor or hot chlorine water. Colored cotton or woolen goods: Wash in lukewarm water and soap or ammonia. Silk may be treated in the same manner, but very cautiously.

Alizarine Inks. — From white goods: Tartaric acid; the older the spot the more concentrated. Colored cottons or woolen goods: If color permits, dilute tartaric acid. Silks: As before, but with great caution.

Blood and Albuminous Spots. — Simply washing out with lukewarm water for all kinds of goods.

Rust, and Spots of Ink made of Nutgalls. — From white goods: Hot oxalic acid, dilute hydrochloric acid and then tin filings. Colored cottons or woollens: Citric acid may be tried. White woollens: Dilute hydrochloric acid. Silks: Nothing can be done without increasing the evil.

Lime, Lye and Alkalies in General. — From white goods: Simply wash in water. Colored cottons, woollens or silks: Much diluted citric acid, drop by drop upon the moistened spot, to be spread around by the finger.

Acids, Vinegar, Sour Wine, Fruit Juices, etc. — From white goods: Simply washing; in the case of fruit, also with hot chlorine water. Colored goods, either cotton, wool or silk: According to the delicacy of the material and the color, more or less diluted ammonia, to be spread around on the spot, moistened, drop by drop, with the tip of the finger.

Tar, Wheel-Grease, as also Fat, Rosin, Carbonaceous Particles and Wood Vinegar. — From white goods: Soap with oil of turpentine, varied with the action of falling water. From colored cotton or woollens: Hog's lard to be rubbed on, and then soaped and allowed to remain quietly, then washed alternately with water and oil of turpentine. From silks: As in the preceding, but more carefully, and instead of turpentine benzole and a continual current of water falling from a height, and only upon the reversed side of the spot. For cleaning silks, soiled and greased, but not thoroughly discolored by acids, etc., the best agent is ox-gall, diluted with lukewarm water and strained. Blood and albumen should simply be soaked in cold water.

Superficial Loss of Substance by Scorching. — For white goods: Rub over thoroughly with a pad dipped in hot chlorine water. Colored cotton or woollens: Whenever possible, color over or raise up the nap. With silks nothing can be done.

## DEEP WALNUT STAIN FOR LIGHT WOODS.

The employment of alkaline manganates for staining light wood in furniture and floors a beautiful, uniform and durable walnut brown is highly recommended by Viedt, as noted in the *Journal of Chemistry*. The action depends upon the decomposition of the salt in the pores of the wood, with the separation in them of very finely divided brown hydrated peroxide of manganese. In practice, addition of magnesia sulphate to the solution hastens the reaction. The process may be conducted as follows: Dissolve equal parts of manganate of soda and crystallized Epsom salt in 20 to 30 times the amount of water, at about 144° Fahr., and brush the planed wood with the solution. The less water employed the darker the stain, and the hotter the solution the deeper it will penetrate. When thoroughly dry, and after the operation has been repeated, if necessary, the furniture is smoothed with oil and finally polished. It is well to wash it with hot water before smoothing to prevent the efflorescence of the sulphate of soda formed. For floors the solution may be employed boiling hot, and if the stain is not dark enough, a second application of a less concentrated solution should be made. After it is perfectly dry, it should be varnished with a perfectly colorless oil varnish. On account of the depth of penetration of the stain a fresh application will not soon be required.

AMERICAN INSTITUTE EXHIBITION. — The 46th exhibition of this institute will open September 12th, in New York city. Parties having novelties which they intend to bring to public notice should at once address the general Superintendent for blanks and information. The medals, it is said, have been increased, and special awards will be made upon a number of articles.

QUICK TIME AROUND THE WORLD. — The Omaha, Neb., *Republican* prints a letter from Dr. F. S. De Hass, American Consul at Jerusalem, in which he gives an account of a tour he has lately made around the world in 68 days of actual traveling time. The letter is dated at Jerusalem, May 10th, 1877. The outline of the journey we quote, greatly condensed, is the following: "Having safely returned to my post I take pleasure in furnishing your readers, agreeably to promise, with a brief notice of my quick and successful tour around the world. Not counting the time I lay over at different points, as these breaks in the journey could all have been avoided, I made the entire circuit of the globe in 68 days, and but for heavy weather on the Pacific would have made it in 62 days. The journey from Alexandria, Egypt, via Brindisi and Paris to London, and from thence to New York and San Francisco, was accomplished in 20 days, and we were just the same number of days going from San Francisco to Yokohama, Japan. Crossing over from here to Canton, in China, took six days. A sail of 10 days over the China sea and through the Strait of Malacca, touching at several points we have not time to notice, brought me to Ceylon, off the southern coast of Hindostan, and one of the richest of the East India islands. Thence we sailed directly to Suez, in Egypt, which took 12 days, and from thence, in a few hours, by rail to Alexandria, our starting point, making the entire distance of 25,000 miles—16,000 by water and 9,000 on land—in 68 days, without any accident or detention of any kind."

GLYCERINE FOR OIL STONES. — Almost every one has more or less use for an oil stone, but in these days a good oil is hard to obtain, and kerosene is often used instead. This is a bad plan, for although it makes the steel "take hold," it ruins the stone. Glycerine is much better, does not dry on the stone, and is easily washed off when dirty. Use soap or soda and water to clean the stone, and then apply the glycerine. Clean water is only needed to wash the stone with, and if treated in this way it can be kept bright for a long time with the grit unimpaired.

THE DEEPEST WELL IN THE WORLD. — The Warren farm well, says an English paper, one of the deepest, if not the deepest, dug wells in the world, was commenced on the South Downs above Brighton in 1858, and after four years' persistent digging the water was reached at a depth of 1,285 feet, the shaft being six feet in diameter down to 400 feet and four feet for the remainder. The operation cost between £6,000 and £7,000, and was watched with the greatest interest by geologists.

COLORLED LEAD PENCILS. — Red, brown, green and other colored lead pencils are made by bringing kaolin or pipe-clay to a doughy consistency with water, and then mixing the mass in a paint-mill with an earthy or metallic pigment of the color desired.

## GOOD HEALTH.

## Hints for Bathing.

Dr. W. H. Vail, well known as one of our best medical writers, gives the following sensible suggestions on this subject in the *Christian Union*:

Whether in bath-tub, river or ocean, bathing should be accompanied only by pleasurable sensations. The whole body should be kept aglow. If any shiverings or chilly sensations are experienced, either you are not well, the water is not of the right temperature, or you are bathing too long. At all events, such feelings are nature's warning that you should at once leave the water and give yourself a thorough rubbing with a coarse towel. Bathing, especially swimming, necessitates great muscular activity, therefore in order that digestion may not be interfered with, at least one hour, and better still two or three, should elapse between a hearty meal and bathing. It is easily seen that 11 in the forenoon, four in the afternoon and just before retiring at night are the best times for bathing.

Some like a cold dash on rising in the morning. Very few, comparatively, can stand such a shock to their nervous systems. Let those who enjoy it, and experience a glow during the operation, continue the practice; but let them be careful how they urge its adoption upon those whose nerves possess a less degree of resistance.

Any one desiring to acquire the habit of a cold bath every morning should begin the custom in the warm weather, continuing it during the winter, and not commence it in the latter season.

If you are perspiring from walking, rowing or other exercise, as you reach the place of bathing do not (as some advise) sit down on the bank to cool off before entering the water. Doff your clothes and dash in as soon as possible, only being careful to keep up the exercise without intermission after you are in the water. In this way you continue the glow which you experienced from the previous exercise.

Ten, or at longest 15, minutes in the water should suffice for the strongest aqueously inclined urchin. Strive always to leave the water before you feel chilly, or certainly at the first approach of any such sensation, and continue or rekindle the glow by a vigorous rubbing with a coarse towel.

## Watermelons as a Medicine.

It seems that watermelons have become out of patience of being considered the occasion of medicine giving and have assumed the role of doctor. Byron Tyson writes the following from Washington to the *Marysville Appeal* for the encouragement of watermelon growers and the prevention of ague: Watermelons are a mild aperient, and if eaten regularly, say at least once a day during the melon season, they will serve to keep the bowels free and easy, and so long as the howels are kept in that condition there is not much danger of disease. But if they be eaten irregularly, say extravagantly for two or three days, and then none for two or three days, the bowels become costive and sickness is the result. During July, August and September last I was located in one of the mining towns of California where no melons were raised nearer than about 20 miles. Notwithstanding the distance we had to haul them I generally managed to keep a good supply on hand. On one occasion, however, they gave out, and for several days I had none. I expressed myself to the effect that I was fearful I would have a chill. Sure enough in a few days I had one. I, however, soon received a supply of melons, and by indulging freely, with the aid of a proper diet (consisting largely of canned oysters and vinegar) I was soon all right without the aid of a particle of medicine. Previous to the time referred to I had never during the melon season, for 20 years or more, been without a full supply, rarely passing a day without partaking of them one or more times. During said time I never had a chill. Now it would seem that if they would induce sickness, such as fever and ague, as has often been alleged, I would during a period of 20 years or more have had some experience in that line. If eaten irregularly they will doubtless produce diseases of the character mentioned; but if eaten regularly I do not believe a better preventive of the aforesaid diseases can be found. I therefore advise people, especially those in fever and ague districts, to eat and spare not. Then see if at the close of the present melon season they will not coincide with me in the foregoing opinion.

DRINKING IN GREAT BRITAIN. — Mr. R. F. Mushet, of England, is a prominent advocate, in Great Britain, of the principles and practice of total abstinence. He contends that the drinking habits of the laboring classes in that country, and not the hard times, are dragging men, women and children down into abject poverty and distress. Certain statistics which he has given in *Ryland's Iron Trade Circular*, of a late date, are well calculated to set thoughtful people to reflecting. He compares the traffic in the two leading articles, coal and iron, with the trade in intoxicating drinks, with the following result: "The sales of coal in 1876 amounted to about £100,000,000 the sales of iron to about £40,000,000; the sales of intoxicating drinks to £147,000,000, £7,000,000 in excess of the joint sales of coal and iron." That is, the people of Great Britain consume more in useless and injurious drinks than they and all their customers in the whole world consume in goods made of iron and the useful and necessary item of fuel! What is true of Great Britain is also probably true of this country, though we would foudly believe that Americans are a little less addicted to drinking habits than our British consins.

ELIXIR OF EUCALYPTUS. — Every one knows that it is claimed that there is heating virtue in the leaves of our abundant eucalyptus trees. We can tell how to put it into available form but we do not know how to use it. E. M. B. gives *New Remedies* the following formula:

Eucalyptus leaves..... 4 Troy oz.  
Alcohol, 86 per cent..... q s.  
Oil Orange..... 3 ij.  
Oil Cinnamon (Ceylon)..... 3 ss.  
Sugar..... 3 lbs.

Reduce the eucalyptus leaves to a coarse powder, add the oils to 1½ pints of alcohol, moisten the leaves with a portion of this menstruum, and pack it in a percolating funnel. Pour on the remainder of the alcohol and percolate 1½ pints of tincture, using if necessary, an additional quantity of 85 per cent. alcohol. Add the sugar to the mixture and make the product measure two pints by adding more alcohol. If alcohol should be objected to, a distilled water may be prepared from eucalyptus leaves, which may be flavored and sweetened as above.

THE POSSIBILITY IN LIFE. — It is estimated that, as a general rule, the length of an animal's life is five times the period of its growth to maturity. According to this estimate, the natural age of man would be about one hundred years. The fact that this age is sometimes attained, shows that it is within the capabilities of the race. But the facts that not more than one in 10,000 do reach it, that more than one-half of all who are born die before reaching maturity, that the average age to which men live is less than forty years, and that the great majority of men hardly know, by actual experience, what vigorous health really is, would seem to indicate that there must be some deleterious influence at work to thus cut short the days of man, and entail upon him so much misery, especially since this great premature mortality is reserved for him alone of all the animal kingdom. What these deleterious influences are can only be ascertained by making the human constitution our study, and subjecting our habits and modes of life to the test of the laws which we find inscribed therein.

Four insertions are rated in a month. Subscriptions in ADVANCE—Postage paid—one year, \$4; six months, \$2.25; three months, \$1.25. Remittances by registered letters or P. O. orders at our risk.

Write for the MINING AND SCIENTIFIC PRESS. We invite not only professional men, but practical miners and mechanics to contribute to our columns. All communications will be kindly treated. Authors, as well as readers, will be benefited by corresponding.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, August 4, 1877.

## TABLE OF CONTENTS.

**GENERAL EDITORIALS.**—The Coming Exhibition; Comstock Mines; Dry Amalgamation; Items of Interest from the Mines; The Rich Men of San Francisco, 65. The Week; Corporate Speculation; Our New Peril; Quicksilver; Lead, 72. Sulphur Supply for the Pacific Coast; Improved Steam Chest Milling Machine; Oregon Silver Mud Again; Legitimate Mining, 73. Borax, 76.

**ILLUSTRATIONS.**—Paul's Patent Pulverizing Barrel, 65. Campbell's Milling Machinery, 73.

**CORRESPONDENCE.**—Argentiferous Hematite, 76.

**MECHANICAL PROGRESS.**—A New Form of Boiler; A Monster Sugar-Pan; Progress of Wire Cables; Progress of the Metric System, 67.

**SCIENTIFIC PROGRESS.**—Geometrical Chemistry; Mating Among Fishes; A New Series of Objectives; Pituitary; A New Stimulant; No Bombs in the Ocean; Mexico; Giant Powder in Arctic Explorations, 67.

**MINING STOCK MARKET.**—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 68.

**MINING SUMMARY.**—From the Various Counties of California, Nevada, Arizona, Idaho, Montana and Utah, 69-76.

**THE ENGINEER.**—Berlin Pneumatic Dispatch; Mechanical Engineers; An Engineer Honored; Railway Through Eden; Canadian Canals; Asiatic Railway Routes; Fast Trains Suggested; The Old Cable; Reclamation of Land in Morecambe Bay; Lighting Tunnels; Costly Bridge, 70.

**USEFUL INFORMATION.**—Removal of Stains from Woven Fabrics; Deep Walnut Stain for Light Woods; American Institute Exhibition; Quick Time Around the World; Glycerine for Oil Stoves; The Deepest Well in the World; Colored Lead Pencils, 71.

**GOOD HEALTH.**—Hints for Bathing; Watermelons as Medicine; Drinking in Great Britain; Elixir of Eucalyptus; The Possibility in Life, 71.

**MISCELLANEOUS.**—In the Midst of a Cave; The Big Air Compressor at Work; Lowell Hill Gravel Mine; The Cost of Smelting; Meadow Lake; Gold Hill Mine—A Good Start, 66. An Army of Miners; Pike City Gravel Mines; A Marvelous Winze; Osceola District, 70. Mining at Iowa Hill, 71. New Incorporations, 76.

## NEW ADVERTISEMENTS.

Mining Machinery Depot, Parke & Lacy, S. F.; Manhattan Fire Brick and Clay Retort Works, Adam Webber, New York; Works for Engineers and Students, John Wiley & Sons, New York; Delinquent Sale—Bella Union Quicksilver Mining Co.

## The Week.

The excitement of last week with regard to the riots has calmed down to a great extent, although care is being taken to prevent a repetition of the scenes we referred to in our last. The Mayor of the city has offered a reward of one thousand dollars for information that will lead to the arrest of incendiaries, and orders have been issued to shoot on the spot any one detected in the act of firing a bulling. In the Eastern States affairs are comparatively quiet, although trouble is brewing among the Pennsylvania miners, who have broken out on a strike.

The suit of the Eureka Consolidated mine vs. Richmond, is still on trial in this city, and a number of experts have been examined. A great deal of the testimony has been interesting, but of too great length for us to transfer to our columns.

C. L. Weller, President of the Mexican and Ophir companies, has created a ripple of excitement in Virginia, by giving notice that all miners boarding at Mrs. Cooper's should leave the place or be discharged inside of ten days. Hereafter, he pledges that miners shall get work on their merits, and independent of the boarding houses. He will also adopt the check system of paying, so that the clerk will not pay silver and make the discount, and no houses giving a commission to those purchasing supplies will be allowed to furnish material for the mines under his management. These orders are called out by the investigation in the companies referred to, and the suspension of Mr. Curtis as Superintendent of the companies.

## Corporate Speculation.

Speculation is by no means confined to individuals in this country or in Europe, but in these days of joint-stock companies, the speculative corporations throw the individuals into the shade. Railroad and mining speculations are well known among us, and in England the companies go into all sorts of schemes, some of which are devised for the special purposes of getting up companies, more than the companies are formed for getting up the schemes. A thousand examples might be cited if necessary, but so many instances may be recalled by any one that it is scarcely worth while.

Americans have generally been credited with the most shrewdness in organizing speculative or absolutely fraudulent companies, so that the impression prevails in some quarters that we do the most business in that line. This, however, is not the case. In England, where everything is reduced to statistics, it is found that an alarming number of mushroom companies have been formed and come to their natural end, while others still exist and others again continue to be formed. In proof of the facility with which limited liability companies are floated in England, the London Mining Journal says that a return has just been issued by order of Parliament, showing the number of joint-stock companies which have at any time during the seven years, ending December 31st, 1875, failed to make the annual return required by the Companies Act, 1862. There were for 1869, 2,846 companies; for 1870, 3,040 companies; for 1871, 3,345 companies; for 1872, 3,608 companies; for 1873, 4,021 companies; for 1874, 5,666 companies, and for 1875, 5,233 companies, so that these limited liability companies grew with great rapidity. The total number of defaulting companies was 5,793, and the number of companies which failed in every one of the seven years was 2,747. The failure of such a large number of these public companies is proof of the reckless manner in which their affairs were conducted, and the competition evoked thereby with old-established firms must have been most ruinous to fair and legitimate trading. The too great readiness with which gentlemen of standing attach their names to prospectuses of companies, of which they know nothing, had been one of the principal means by which many of these chimerical schemes have been floated; and in the interest of commerce generally it is necessary it should be stopped.

This, from a leading mining and commercial English paper, shows to what a state of affairs this reckless corporate speculation has led. The Journal further says: "It is unfortunately too true that during the past four or five years there has been a good deal of reckless speculation, and the numerous limited liability companies which have shot up in our midst with mushroom rapidity have proved most inimical to commercial morality and sound trading. Many of these schemes bore upon their face the evidence of mere illusory bubbles, which the first adverse breeze would scatter to the winds, and effectually dissipate the money which had been invested by the too credulous capitalist. Many others, however, bore the impress of bona fides by the weight and authority of the names attached to the directorate, and although it was known to the initiated that these names were mere ornaments, such information was not possessed by the public generally, and the consequences is that many investors (it may be of very limited resources), were drawn into meshes from which it was difficult to escape, by which they lost considerably."

In connection with this matter of "ornamental directors," we learn from the same paper that a salutary lesson has just been taught by Vice-Chancellor Sir James Baron: "It is a well-established fact that in several instances which have come before the English courts, large numbers of shares have been given and accepted by gentlemen in order to qualify them as directors. By accepting these shares it is evident that the recipients were quite prepared to accept any profits which might accrue, and the Vice-Chancellor in his decision has decided that they must also accept the responsibilities and risks of their actions, and be answerable by any loss sustained, and for the expenses incurred. When this legal and just decision shall become more generally recognized a better state of things will be established, and these decisions of the court must be hailed with satisfaction by all who are desirous of seeing the commerce of the country based upon a sound and permanent foundation."

**A GAIN FOR THE EAST.**—After two and a half years of earnest and faithful work in the important post of proof reader for the PRESS, Mr. William Henrici has withdrawn from our little world and returned to his home in Pittsburgh, Pa., to regain the strength which has been hazarded by close application. To Mr. Henrici the PRESS has been greatly indebted for the typographical accuracy which has characterized the paper. He departed from us bearing tokens of our regard for him. We can but wish that the fullest health may return to him and he to California.

THE Bannock Indians, Montana, have been committing depredations and murders on the Salmon river.

## Our New Peril.

The excitement attendant upon the riotous proceedings in this city, last week, has subdued without causing an entire cessation of the extra vigilance incited thereby on the part of the regularly constituted authorities and the better class of citizens generally. With the accustomed order and quiet restored, it may not be out of place to remark now upon certain phases that have characterized this perturbation in our midst; to examine also a little into the nature of its ostensible causes and consider the classes who appear to have been most active in promoting it. The crisis being over, the Press may now comment upon the various aspects of this business with more freedom than would have been expedient while the public mind was inflamed by the exigencies of the occasion.

In the first place, it may be observed, the cause of the trouble here was somewhat different in its nature from that which led to the turbulent proceedings in the East. There it was more a question of wages; here, of work. There the disturbance grew out of a demand for better pay; here, for more employment. The laboring classes of San Francisco, to which place this movement was mostly confined, have not complained so much of their compensation as of the growing want of something to do; a want that for several months past has, not only here, but throughout nearly all parts of the Pacific coast, been very severely felt.

As is well known, property-holders, more especially the holders of large tracts of agricultural lands, have, through the flattering and very often exaggerated accounts published about California, drawn hither a considerable emigration from the Eastern States and Europe, and which, added to the natural increase of the country, has, during the last few years, added largely to our permanent white population.

California is a land prolific in children, and our youth mature early, reaching betimes a growth that fits them for physical labor. From these two sources the various industries of the country were receiving a sufficient supply to meet all healthful and normal demands for labor, and well would it have been for us had they been left to draw upon these sources alone.

Such, however, has not been the case. While we were growing or importing enough white, Christianized labor to serve every purpose, China has been suffered to pour in her debased and servile hordes upon us, forcing down wages while they created a sharp competition for the work that was to be done. In this fight for employment, these coolies, owing to their habits and modes of living, have been able to nearly monopolize certain pursuits and callings, and even engross many important industries altogether, thereby entailing a great hardship upon our own working classes, more especially the youthful and female population. All branches of manual labor which, requiring but little skill or physical strength for their performance are, in other countries, reserved for boys, girls, women and children, have here been monopolized almost wholly by the Chinese, exciting against them the deep and determined hostility of our entire working population.

And this is the problem with which we have to deal. How we shall be able to retain here, this odious race and find work for our own unskilled laborers while we prevent fatal collisions between these two classes at the same time, is the question which our legislators, economists and the molders of public sentiment in general are called upon to solve. There is no use of denying or attempting to disguise the facts as above stated. The condition of things as here represented, actually exists and is daily growing worse. That our mechanics, craftsmen and the mass of day laborers should have held aloof from participating in the late riots and even aided the regularly constituted authorities and those who were co-operating with them in their efforts for preservation of life and property, argues nothing against their fixed hostility to the Chinese and their determination to prevent by all lawful means, the further ingress of that people upon these shores. Whether, if this immigration is suffered to go on unrestrained, the efforts of these classes to check it shall be confined to strictly lawful means, is, indeed, open to serious question.

For the present, the danger that threatened our city is over; but the causes that lead to that danger have not been removed, nor perhaps to any great extent abated. The work of eradicating these causes, if that is practicable, remains to be done; and it is time that all parties interested in the issue should set about devising ways and means for its accomplishment. One way for reaching this end might be the more general employment of our own people in preference to the Chinese, while measures are taken for preventing their further emigration to this country. If the protection of person and property, without any regard to bringing about an improved condition of our own industrial classes, is the sole object to be attained, then this might be reached through the employment of overwhelming police force backed by a regular standing army, after the method adopted in the older countries of Europe. This, however, is not a curative, but merely a palliative method; through it the dangerous and dissatisfied classes are not exterminated, only kept at bay.

We should aim at achieving some cure less costly and more beneficent.

Let it be remarked here that we are not interceding for that class of malcontents who neither want work themselves nor care anything about those who do. We have that class amongst us in considerable numbers, larger perhaps than in most other communities. If any means can be invented for getting rid of them we shall not interpose to defeat their speedy and effectual employment. Let them be killed off, if this is the only way by which we can effect their extermination. The thing we are writing about is altogether another matter.

This has been a bad year for the farmers and the employing miners, wherefore there has been but little work to be had among them. The country is full of idle men—idle because they can find nothing to do, while in San Francisco it is even worse. Building, which in the early part of the season was quite active, has nearly ceased, throwing great numbers out of employment. The city swarms with men, women and youth out of employment and out of money. Meantime 20,000 Chinamen do the work that these people wish to perform and which they feel that they have a right to do. Idle men, especially when they feel that they have been wronged, are apt to grow ugly. There is a danger that it will be so here, and that if they do not get other employment the devil will, as the good Doctor Watts tells us is his wont, find something still for these idle hands to do. Let the rich and well-to-do consider if they are not taking some chances of a dangerous outgrowth of proletarian and communistic ideas in neglecting to correct this evil. Cannot something be done to discourage the employment of the Chinese and thereby secure to our needy and deserving white population a larger share of the work that in both the city and county requires to be done? We believe that some concerted action looking to this end is called for, and have faith that if undertaken it would result in great good.

## Quicksilver.

The quicksilver market has been a little excited by a pretty sudden rise in price. It is now quoted at 57½ cents, and has been selling from 42½ up to 50 cents lately. Prices are, however, by no means steady and it is really selling anywhere between 50 and 60 cents, some holding to the latter figure and others offering the former. Only 18 flasks went off on the China steamer, because the Chinamen would not buy at the advanced rates. One of our largest mines closed down a week or so since to reduce the production, which may have had something to do with this rise, but the small shipment to China will leave more than the usual quantity here, so that the closing down of the mines referred to may be counteracted, temporarily at least.

Neither receipts nor exports have been as large during July as in June. The exports for July amounted to 3,719 flasks, valued at \$123,009. The total exports by sea for the first seven months of the year have been 32,292 flasks, valued at \$1,083,520. The total receipts in the city since January 1st, has been 42,948 flasks.

There is little reason for believing that the advance will be maintained. It would be difficult for the large mines to effect any combination to keep up prices, if they were so inclined, as there would be so many competitors if the price were a little higher. There are hundreds of small mines which could produce a few flasks each, every week, if the prices offered sufficient inducement for them to go to work. The miners, however, do not find any profit in working at present prices on the smaller mines.

If, however, the price went up to any reasonable figures, many of these mines would be started up, and were any combination effected among the large mines the price would be cut under so much and by so many that it could not be maintained. The ruling rates are good for gold and silver miners, but poor enough for the producers of quicksilver.

## Lead.

The persistent decline in the lead market has had a disastrous effect on many mines on this coast. In Utah, particularly, the depression has been injurious. In several camps the mines have been compelled to discharge their workmen who have had to go to work prospecting or anything they could find to do. The low prices in lead have prevailed so long that the miners seem to think the market is fried and the price at its normal condition.

This coast produces such large quantities of this most useful and widely used metal, and so many mines have been opened within the past few years, that an immensely increased production naturally resulted. Where there is so much competition, the price of course, dropped, but it was hoped that it was only temporary; now, however, that this has lasted so long, the owners of mines producing lead have been greatly discouraged.

Our treasure shipments to New York in July amounted to \$4,493,079, of which \$3,666,300 was in gold coin. This, together with the foreign shipments, makes a total treasure export for the month of \$7,170,000.

## Sulphur Supply for the Pacific Coast.

## The Nevada Deposits.

Some three years ago there were found in Humboldt county, Nevada, what, at the time, were supposed to be rich deposits of sulphur. The locators of this find came to San Francisco and here endeavored to raise money to aid them in opening up these beds, erecting refining works and introducing this crude and prepared material upon this market. At that time the consumers of and dealers in this commodity were deriving their supplies from Italy, and in part also from Japan, the latter, then, a new source of production, and, distrusting either the quality or sufficiency of these Nevada deposits, extended to the owners little encouragement in their efforts to outfit their property and render the mineral commercially available. This was clearly a mistake on the part of the sulphur buyers, who, had they pursued a more liberal policy, would to-day, without doubt, have been getting the article from domestic sources and at lower prices than they are now paying for it, besides having their wants met with greater certainty and steadiness.

## The Japan Sulphur Banks.

Upon which much dependence was at that time had, have not yielded according to expectation. For some reason or other, most likely because the magnitude of the deposits were at first overrated, or, perhaps, because the government to whom they belonged would not allow them to be largely worked, shipments from that quarter have been limited to a few small cargoes, arriving here at such long and uncertain intervals as precluded buyers from depending upon them; and in estimating the competitive sources of supply for this market, Japan may now be counted out of the field. The sulphur beds of that country are situated on the island of Yesso, 35 miles from the seaport town of Hakodadi, the nearest point from which export shipments can be made, and to which the crude sulphur is carried by the natives in small boats. Hakodadi being some seven or eight hundred miles from Yokohama, is a long way off the route usually pursued by ships trading between Japan and this country. Only two classes of vessels bound hither, are apt to seek that port in quest of cargo, the first being such as having visited the Russian settlements on the Amoor river, returning, may touch here without going much out of their way; and the other ships that, having discharged freight at Yokohama, may sometimes, for the sake of obtaining back lading in part, run down to Hakodadi and take in such small lots of sulphur as may there have accumulated. This business being so unstable and altogether such a petty sort of traffic, the acid factories of San Francisco, the only ones of any magnitude on the coast, cannot rely upon it to furnish them with the raw material.

## The Discovery of Other Sulphur-Bearing Localities on this Coast.

Have from time to time been announced, but none of them have as yet proved to be of much practical value. Where the mineral itself has been tolerably pure and abundant, as has happened to be the case in some instances, the site of the discovery has proved to be too remote from San Francisco, or too far distant from railroad or water communication, to warrant the cost of its carriage to market. Two years ago much was said about the sulphur-producing strata laid open at Steamboat springs, the site of the wonderful chemical activity in Washoe county, State of Nevada. But the mineral here, although spread over a large area, was, on further examination, found to be too much mixed up with foreign matter to admit of its profitable extraction. About the same time another discovery of this kind was reported in Humboldt county; but as nothing further has been heard of it since, it is fair to conclude that it did not amount to much. A portion of the grounds of the Sulphur Bank quicksilver company, at Clear Lake, California, is heavily impregnated with this mineral. Owing to the presence so large a percentage of base substances the out-turn of mineral here, even if the deposit be worked to the best advantage, cannot be large. These include all the localities in our own territory at which sulphur in any considerable quantity has been found. There is said to exist a sulphur bed of some extent in Lower California, but we are not advised as to the probable amount or purity of the article in its natural state, nor yet as to the facilities that exist for refining on the spot, or for shipping the crude material to market. The probabilities are that there is a deficiency in some or all of these respects, or this deposit would before this time have been turned to some practical account. Presumably, then,

## The Only Really Valuable Deposit of this Mineral in the United States.

And, so far as we know, on the western continent, is this in Humboldt county, Nevada; and it certainly reflects unfavorably upon the enterprise and business sagacity of the acid manufacturers and druggists of San Francisco, that this one of our home resources should have been so signally neglected. To put up refineries and otherwise properly outfit an enterprise of this kind, requires but a comparatively small amount of capital; and yet, the owners of this valuable property have been suffered to struggle along, making such improvements as could be effected with their own limited and inadequate means,

many thousands of dollars in the meantime having been sent out of the country for the purchase of a commodity that, with a very small outlay, might have been produced at home, and the manufacture of which would have given employment to a good many working men, furnish transportation for our railroad and other carriers, and incidentally afford aid to various other industries. Notwithstanding they have been so slighted in a quarter where they had reason to expect substantial aid.

## Extent of Deposits—Work Done and Production Made.

The proprietors of these sulphur banks have succeeded in getting them in a tolerable condition for a moderate production. Such developments have been made as prove the mineral to be of extremely high grade and practically inexhaustible. Experts and scientists who have visited the locality give it as their opinion that their is sulphur enough here to supply the world's commerce for an indefinite period; enough within easy reach to meet the wants of our own country for many years to come.

There are two incorporated companies operating at this place, who together own about all the valuable sulphur yielding land in the vicinity, their joint claims covering an area of some four hundred acres. The mineral occurs here in immense strata imbedded in the earth, some of which crop out in great reefs above the surface. For a mile or more in linear extent these deposits exist in great magnitude. How far they reach downward has not been determined, the mass showing no sign of contraction at the considerable depth to which it has been explored. At one point an excavation has been made 218 feet in length and 59 feet across, all in workable bank of sulphur. At another spot some distance from this, another of nearly equal extent, has, with similar results, been

it could be carried on successfully in defiance of competition from abroad, and which would finally result in greatly reducing the cost of this commodity to the consumer.

## Danger of Explosion

In an economic view there are good reasons why consumers, and more especially the manufacturers of powder, should encourage the introduction upon the market of a pure article, like this from Nevada. At a meeting of the San Francisco Microscopical Society, held not long since, Henry G. Hanks, the eminent analytical chemist made a statement to the effect that much of the sulphur here sold as sublimated, consisted merely of the powdered article, and consequently contained a considerable percentage of foreign matter. Mr. Hanks illustrating and confirming his statement by submitting to microscopic inspection samples of what purported to be sublimated sulphur purchased by him from various druggists in the city. On the strength of the same good authority there is reason to believe that many of the otherwise unaccountable explosions that occur in our powder mills are due to the substitution of this deteriorated sulphur for the sublimated article, a consideration that should admonish great caution in the use of materials for the manufacture of this explosive.

## Improved Steam Chest Seat Milling Machine.

Those acquainted with locomotive repairing know that the action of the heat in the steam causes the acid in the lubricating tallow to corrode the iron. This is especially noticeable as occurring in the vicinity of the valves and steam chest. In the latter case, the ledge which sup-

CAMPBELL'S MILLING MACHINERY.

made. Altogether the two companies have extracted something over two thousand tons of the crude material, about two-thirds of which have been refined on the ground and the balance shipped in its native state, the whole having found market in this city. Each of these companies have erected refining works with other needed buildings at their mine, their joint expenditures for these and other necessary improvements having amounted to about \$50,000.

The sulphur containing material taken out here averages about 70 per cent. pure mineral, a great deal of it being chemically pure; of this latter variety many tons have been extracted, the whole of it of sufficient purity for the manufacture of powder without being subjected to any artificial process whatever. Last summer a block of this kind, weighing 1,200 pounds was broken out and started for the Centennial Exposition, where it would, no doubt, have caused some wonderment, had it succeeded in reaching its destination; an end that was defeated through a mishap at the railroad, where it fell while in the act of being hoisted upon a car and broke to pieces. These deposits of sulphur fields is distant about 30 miles in a northerly direction from Humboldt station on the Central Pacific railroad, between which points an excellent wagon road has been constructed.

Now that it has been demonstrated that we have at home enough sulphur to meet all local and national requirements, a couple of things, it seems to us, should at once be done; sufficient capital should be furnished the parties having this business in hand to enable them to enlarge and prosecute it with efficiency, a preference being given by purchasers and consumers to this over the foreign article; then Congress should impose a small duty on the importation of crude sulphur, just enough to enable our own producers to get and keep the home market, a policy that would soon so develop this industry that

ports the steam chest is frequently corroded to such an extent as to require repair. To do this necessitates much time and labor, as a recess or groove has to be cut with the chisel; and then brass strips are driven in and trued up to effect a tight joint.

The object of the invention illustrated in the annexed engraving is to accomplish this work of grooving, then of truing off the inserted pieces, without skilled labor and in a short time. The machine is supported by four studs, as shown; and motion is imparted to the mill or cutter by a shaft on which slides a suitable gear, meshing into one on the tool carrier or crosshead, the latter being fed to the work, in either direction, by a screw and suitable gearing, shown on the end of the machine. The tool, in starting, is fed down by the small hand-wheel on top of the carrier. Motion is given by turning the crank; and when it is desired to feed in an opposite direction, the small gears are disengaged by moving the small lever and swivel to which they are attached. The machine is also used to cut out the ports on new work; and by replacing the cutter with a drill, holes can be bored for the studs.

This invention has, we are informed, been successfully used in the shops of the Pennsylvania railroad at Altoona, and is there considered a very useful tool, saving both time and money. For further particulars and rights to manufacture, address the inventor and patentee, A. H. Campbell, Box 1136, Altoona, Blair county, Pa.

THE work upon the new hoisting works of the New England is almost completed, and in a day or two steam will be turned on. Sinking the incline has been resumed, the tank for the nine-inch pipes being completed.

## Oregon Silver Mud Again.

During the Oregon thermal spring mud excitement of last winter, a gentleman of this city had samples of this mud sent to him to have tested by assay. The returns were so fabulously rich he forwarded to Prof. Silliman, of New Haven, Conn., duplicate samples. He, as well as Prof. Price, of this city, pronounced the mud a "job" well salted and bunglingly "put up." We published Prof. Silliman's opinion in the MINING AND SCIENTIFIC PRESS at that time, and the springs ceased flowing.

They have, it seems, become active again. Muddy silver is said to be all the rage in Oregon, and machinery, bargained for to extract their precious (?) contents, on the ground. Mr. Wm. Currier, a well known merchant of Portland, Oregon, but residing in this city, being anxious to ascertain the facts as to the value of the find, sent, at his own expense, a competent and confidential agent to the springs to examine and report. The samples of the material taken by himself were from springs said to be rich. They were put in bottles, sealed up and forwarded to San Francisco for assay. The gentleman to whom we refer forwarded it to Prof. Silliman for a careful analysis, and he answers as follows:

"The sample of mud sent me I have examined carefully, both by nitric acid and by ammonia, and it contains no metallic silver or chloride of silver. I have also concentrated it by washing and detected nothing in the concentration by the microscope. I have made no fire assay, deeming such a proceeding quite useless after this other evidence so decidedly negative. It is evidently unlike the other samples sent me, in which it was so easy to detect the silver both chemically and optically. I regret that the fraud should come up again under the sanction of Mr. Hanks, whose name carries a certain authority. Can we doubt that he has been deceived? That silver salts have, in past times, come up from the deep-seated laboratories of nature in solution and been precipitated by various agents in veins of silver ore no one can doubt who has made a study of silver mines, but I doubt if ever in the world's history silver salts came to surface in open air or were influenced in any degree by meteoric conditions such as seem to influence the judgment of Mr. Hurley, as stated in his letter of April 19th, cited in the PRESS. I too have examined and now hold in my hand samples of the remarkable mode of occurrence of silver in southwest Utah, near Leeds. I find no analogy in the two cases, but as I propose discussing the character of the Utah locality in a separate paper, I will not now go into its merits."

## Legitimate Mining.

The business of mining is now established on a more permanent and safe basis than it ever was before on this coast. The recent depression in mining stock values is more a proof of this than otherwise. Mines in which nothing of value can be seen, do not sell now-a-days for a high price. People are wiser in this respect than they were, and if they think a company is running a mine more for stock speculating than for legitimate work, they are suspicious of reports from it. This year, particularly, capitalists who have drawn out of stock speculations have commenced to invest in legitimate mining enterprises over which they can exercise control. It will be found more profitable in the end to get hold of a good mine and work it economically in a small way than to be one of a large company, with numerous employees and officers and heavy expenses, but not always correspondingly profitable. This is one of the reasons why there has been a revival of the quartz interests of California this year. There are numerous mines in this State which are being worked quietly and economically by private individuals, which are paying well. The general public hear but little of them, as their names do not appear on the stock lists, and the results of the operations are known only to the owners. There are many mines of like character already discovered, and partly developed, which require only a moderate investment of capital to be put on a paying basis. The miners or prospectors who own them have not the means to put up machinery for hoisting and pumping, which all mines need after a certain depth has been attained, and they lie idle in consequence. Those who desire to engage in this legitimate kind of work, can find mines enough, and if judicious care is exercised in the selection, there is little danger of loss. There is no necessity of putting up an expensive mill because one owns a mine. There are generally custom mills enough to work the ore until the mine can pay for its own reduction works. We know of no more satisfactory investment than a good mine, under the owners' management, worked carefully and economically.

THE telegraph brings news of a grave disaster to the Russians before Plevna, there being great loss of life in the ranks of the Czar. Eight thousand are reported killed and 24,000 wounded. The Turkish force to the number of 20,000 was entrenched, and they repulsed the Russians with great slaughter.

## Steam Engines &amp; Boilers.

NEW AND SECOND-HAND.

One Patent Straw-Burning, Portable En-  
 gine, (new,) fire box boiler, the best  
 Portable Engine on the coast; built  
 by Ransom, Sims & Head, Ipswich,  
 England.

One Steam Fire Engine, second-hand,  
 in excellent condition, with 200 feet  
 leather hose, very cheap, just the thing  
 for a small town. Button & Blake,  
 builders, Waterford, N. Y.

One second-hand Stationary Engine, 14x30  
 inches, link motion, with or without  
 hoist gear.

One second-hand Stationary Engine, 8x20  
 inch, with or without hoist gear.

One Upright Boiler, Horizontal Engine  
 on wheels, Eastern make, 7x12.

One Upright Boiler, Horizontal Engine,  
 San Francisco make, 6x12.

One small Stationary Engine, 3½x7 inch.

One Steam Boiler, 40 inches diameter, 16  
 feet long.

One 8x10 Straw-Burning Portable Engine.

One Traction Engine, three wheels, rub-  
 ber tires, double cylinder, 6x10 inch;  
 Thompson's patent, D. D. Williamson,  
 builder, New Jersey.

One Stationary Engine, 10x20, just had a  
 thorough repair, almost as good as new.

One Stationary Engine, new, 12x24, independ-  
 ent cut-off.

One 6x12 Engine and Boiler, can be mounted if  
 required. Very cheap.

Various other second-hand Engines and  
 Boilers for sale cheap.

J. W. RILEY,

P. O. Box 2361. San Francisco.

## Mining and Scientific Press

Is the leading mining journal in America, and enjoys a  
 large circulation among the more intelligent operators and  
 workers in the gold fields of the world.

As a scientific and mechanical representative of the Pa-  
 cific Coast, it is decidedly popular and a standard journal  
 with the most thrifty industrial people of the Pacific  
 States and Territories. Its authority is of the highest  
 order, and its usefulness in its special sphere unrivaled.

Every public library, mining engineer, metallurgist  
 mining operator and intelligent mechanic and manufactur-  
 er will find profit by its reading.

Subscription, \$4 a year in advance. Sample copies, post  
 paid, 10 cents.

DEWEY &amp; CO., Publishers, S. F.

San Francisco Pioneer Screen Works,  
 J. W. QUICK, MANUFACTURER.

**SCREENS**  
 Several first premiums received  
 for Quartz Mill Screens, and Per-  
 forated Sheet Metals of every  
 description. I would call special  
 attention to my SLOTT CUT and  
 SLOTT PUNCHED SCREENS,  
 which are attracting much at-  
 tention and giving universal  
 satisfaction. This is the only  
 establishment on the coast de-  
 voted exclusively to the manufac-  
 ture of Screens. Mill owners using Battery Screens exten-  
 sively can contract for large supplies at favorable rates.  
 Orders solicited and promptly attended to.

 MINING ENGINEER and METALLURGIST.

P. O. Address: ALAMEDA, CAL.

## \$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan  
 upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uni-  
 form and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily ad-  
 vancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not  
 answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other  
 in the market, and will sell them as cheap as any other of its class.

## LIFE INSURANCE CLAIMS.

The Supreme Court of New York State has decided that  
 the law allowing six months over from the date of first  
 publication of Receivership must be complied with, and  
 that it would not be sufficient to file a claim after that  
 time, even if done before the payment of the second divid-  
 end. Therefore, claimants must take prompt action in  
 order to protect their interests, because in some instances  
 the time allowed has nearly expired.

James Munsell, Jr., has established special facilities in  
 the East for presenting in due form and collecting all  
 kinds of claims on policies in Eastern Life Insurance Com-  
 panies in liquidation. It is a matter of great importance  
 that claimants should place their policies only in the  
 hands of persons of experience in the insurance business,  
 in order that their policies may be properly valued and  
 their interests efficiently as well as faithfully represented.  
 Appreciating this fact, several attorneys-at-law in San  
 Francisco and elsewhere have placed the claims of their  
 clients in the hands of this agency for presentation with  
 the Courts and Receivers in Eastern States.

Parties who have only partially filed their claims by cor-  
 respondence with the late Receiver, Grace, who has been  
 superseded, (and the case of Hoyt vs. the Continental en-  
 tirely set aside because illegal), may find it desirable to  
 have their claims presented in due form through this  
 agency with Receiver O'Neill, in the new suit brought by  
 the Attorney-General. Parties filing claims through this  
 agency will be relieved of all further trouble, and final  
 settlement will be made with them at this office on the  
 first, second and third dividends, as fast as made by the  
 Receivers.

For the direction of claimants who are unacquainted  
 with these matters, special reference is made to the Agents  
 and Managers of the principal Life and Fire Insurance  
 Companies in San Francisco. Correspondence from the  
 interior will receive prompt attention.

Office, 224 Sansome Street, corner of California, over  
 the Bank of British Columbia, San Francisco.

N. B.—One of the publishers of this journal has, with  
 confidence, employed Mr. Munsell to collect his claims  
 against the Continental Life Insurance Company of New  
 York.

## CAUTION TO HYDRAULIC MINERS.

All persons, excepting those having the right by purchase from me, are hereby cautioned against using, or making, or selling any device for turning the discharge pipes of hydraulic machines which uses the deflecting force of the stream of water.

Any such device is an infringement of United States Letters Patent, granted to me on the 16th of May, 1876, and re-issued September 19th, 1876.

I have commenced suit against Richard Hoskin for infringing my said patent, and intend to prosecute all parties using such Deflectors without license from me, there being no other way to protect my rights.

Any parties wishing to purchase the right to use this device can do so by making application to me.

HENRY C. PERKINS,

TOLLES IMPROVED CONCENTRATING TABLES.

### Improved Concentrating Tables.

The illustration on this page represents an improvement in concentrating tables for ores recently patented through the MINING AND SCIENTIFIC PRESS Patent Agency, by J. U. Tolles, of Virginia City, Nevada, who has been using the apparatus very successfully in several places. In the engraving, *A* represents a flat inclined table provided with a surfining of cloth or other suitable material of any kind, and with the ledges *b*, to prevent the material from passing over the ends. *B* represents a peculiarly constructed feed box extending along the upper edge of the table and provided in its front side with a row of discharge openings, *c*, of the form shown, each narrowing down to its lower end and of such a size as the nature of the material requires. *C* represents a receiving box or trough, extending along below the lower edge of the table. *D* represents a leaf or board hinged to the rear side of the trough or box *C*, in such a manner that it may be turned under the edge of the table to conduct the valuable material therefrom into the box, the refuse passing over the edge of the table and discharged upon the ground, or into the box in the rear of the box *C*. *E* represents a rotating tube or pipe suspended lengthwise above the upper edge of the table by endless belts *d*, passing over pulleys *e*, supported in the rigid frame *F*, or by brackets fastened to the frame and extending out the proper distance over the table, the tube resting and rotating upon them as shown in Fig. 2. The tube is provided from end to end with a row of perforations, and with a hand lever, *h*, at one end, and is connected by a hose *i*, to a tank, pump or reservoir, delivering water at a pressure of from eight to 12 feet of head, as the nature of the case requires.

In operating the machine the feed box is narrowed to about one inch at its farther end, or has a strip of board set edgewise in the bottom, and running obliquely across the same from the rear to the front side, causing the material to gradually be brought to the front and discharged through the feed holes *c*, upon the table, thereby insuring an even distribution and steady flow of the material to be treated; a steady and copious supply of water is maintained in the box, and the ores, sands or tailings introduced therein. The water escaping through the openings, *e*, flows down in a thin light stream over the face of the table. The mineral particles are deposited upon and retained by cloth or other surfacing material on the face or bed of the table, while the light refuse matter is carried over the lower edge and discharged outside of the box *C*. After the collection of a suitable amount of metal upon the

table, the supply of water, etc., to the feed box is stopped by the gate and turned upon the other table. Clear water is now supplied to the first pipe, *E*, and allowed to run down over the table, (for a moment), washing off the remaining refuse sands, and at the proper time the hinged leaf *D*, is drawn (by the rod) under the edge of the table, the pipe being rotated or turned and the water thrown through the perforations upon the table in a row of fine jets, forming an almost continuous sheet or film. By means of the lever *h*, (which should be fastened on the pipe at right angles to the line of perforations), the tube is turned and the sheet of water swept over the table from the top to the bottom so as to drive all adhering particles therefrom and wash them down into the box *C*. After this operation the jets are stopped from the tube, the leaf

thrown back, and the gate shipped to the other feed box, the feed water coming back on the first table, the operation being repeated as often as it is seen the tables are charged with the sulphurets or other valuable metals.

By employing the proper kind of cloth, grooves, riffls, or copper plating, or all of them combined, and giving the tables the proper grade, and properly regulating the flow of water, the inventor finds that he can effect a very rapid and thorough separation without agitating the table, and without power of any kind except the manual labor requisite to change the feed from one table to another, and washing them off by means of the water used in the pipes; he also finds by the employment of the fixed table he can separate particles which cannot be retained in machines which vibrate. By use of the feed openings, *e*, of the form shown, the discharge of the sand, ore or other fine material is rendered very steady and gradual, as it will be carried through the narrower portion of the openings, while the lighter water will pass over the same through the upper large end of the openings, taking up the material very gradually and distributing it very evenly upon the table. It is obvious that the rotating tube may be sustained in any other manner, and that it may be connected in any suitable manner with the source of the water

The object in arranging the perforated pipe so that it can rotate is to permit a gradual change in the direction of the jets, so that their point of impact upon the table can be advanced from its upper to its lower edge, and thereby every portion of the surface subjected in turn to the direct impact of the jets, in order to effectually loosen and drive forward the particles therefrom.

The flow of water can be regulated by the valves operated by the cords. The gate shown in the feed trough, *G*, will throw the water into either feed trough as desired.

The plugs in the ends of the pipes, *E*, are for the purpose of freeing them of any obstructions.

Fig. 3 represents the most convenient form of erecting the tank or reservoir which supplies the tubes with water; it usually being placed directly overhead with water shed underneath.

Mr. Tolles with this apparatus does not profess to do what many others claim to do, but he is running many of them where everything else has failed. He has been running several of these tables on the Comstock for nearly two years and is now building more. By using the proper kind of sizing apparatus in connection with the tables, the inventor is doing some close work with them at a nominal expense of constructing, running and keeping in order. He states that any person using anything of like nature, or any portion of the same for like purposes, without first obtaining license for so doing, will be prosecuted for damages for such use. Persons at a distance can build and run them by first obtaining license and instructions from the inventor, John U. Tolles, at Eureka, Humboldt county, California, or W. S. Tolles, his authorized agent at Virginia, Nevada.

## Rand's Rock Drill.

Its use in mines brings about

- 1.—Decreased cost of ore.
- 2.—Increased output of ore in a given area of working ground.
- 3.—Decreased number of men employed, consequently saving large permanent investments in houses for men when an increased production is desired.

Testimonials, Circulars and Price Lists, illustrative of the most recent improvements in this class of machines, will be cheerfully furnished on application to the

RAND AND WARING DRILL AND COMPRESSOR COMPANY,

21 Park Row, opposite New Post Office, New York.

## STATISTICIAN.

### MONTHLY.

Each issue of the Monthly contains matter revised to the day of publication, regarding Distances, Modes of Travel, Rates of Fare, and Telegraphic Tariff of the Pacific Coast; Postal Regulations, Rates of Domestic and Foreign Postage; List of Post Offices; Prices, Assessments and Dividends on Mining Stocks, and new matter pertaining to general information, and the questions of the times.

### RATES OF SUBSCRIPTION.

One Copy, one year.....\$2 50  
One Copy, six months.....1 50  
Three Copies, one year.....6 00  
Single Copy.....25 cents.

### ANNUAL.

Each issue of the Annual contains all matter previously included in the Monthly, and presents information of a general and statistical nature in a convenient form for reference and revised to the day of publication. Accuracy in compiling, care in revising, system in arrangement, and freedom from prejudice in selecting, are faithfully observed in the compilation of this periodical, which is offered to the public as a reliable epitome of general information.

Send for further information. Machinery is run by Steam

## San Francisco Cordage Company.

Established 1856.

We have just added a large amount of new machinery of the latest and most improved kind, and are again prepared to fill orders for Rope of any special lengths and sizes. Constantly on hand a large stock of Manila Rope, all sizes; Tarrad Manila Rope; Hay Rope; Whale Line, etc., etc.

TUBBS &amp; CO.,

611 and 613 Front Street, San Francisco.

Continued from Page 69

The gravel in the bottom of the shaft prospects in gold; one piece found weighed \$133, and is in the shape of a Roman cross. Flanagan, Dodson & Co. have also commenced sinking a shaft on Weaver gulch, intending to go to bedrock if possible. Bill Johnson's arastras are running on ore from the Antelope and Marcus mines, and is paying well. George Bird and John Timmerman are astraining from the Mulum in Parvo mine, which pays \$30 per ton. Mr. Partridge is having his shaft, on Sexton, pushed ahead vigorously.

**DRY WASHING.**—A great local excitement is raging here over "dry washing machines." Mr. J. Powell arrived here about two weeks ago with one of those machines, and has since then been making a grand success, saving the finest flour gold. Mr. Powell states that he can run through 52 tons a day with the assistance of three men, and clear \$100 per day from ground that will prospect three cents to the pan. Mr. Powell is about to have several more of these machines constructed. A great many companies are being formed to go into the dry washing machine business. It is claimed that from Rich bill to the Hassayampa, a distance of 10 miles, the whole plain, gulches, arroyos, canyons, bars and hills will pay five cents to the pan. Up to the present time water has been the great desideratum in the district. The placer ground being located so rapidly in 20-acre tracts, the miners of the district held a meeting and cut down placer claims to 200 feet square, thus giving everybody a show. Mr. McBain, who at present is building Mr. Partridge's new hotel on Antelope creek, is about to take a contract to make a large number of those dry washing machines. He has one of his own in company with some others at Prescott, which he intends to have removed to this place at once. When the work is done, the machines are at work here and they accomplish half what is claimed for them it will make things lively.

### Idaho.

**EMPIRE.**—Owyhee *Avalanche*, July 21: Work progresses satisfactorily in the fourth and fifth levels of the Empire and the mine is looking well in all directions. The rich ore shut from which much good rock has been extracted during the past few months will, it is believed, extend to the surface.

At the Oolden Chariot sinking operations are progressing under the most favorable auspices.

**THE BELLE PECK** is in the full tide of successful operations again. There are nearly 70 tons of rich ore on the dump awaiting crushing and it will undoubtedly yield from \$70 to \$80 to the ton. Within a day or two there has been encountered in the lower level of this mine a richer vein than was ever worked since the mine was opened.

**THE POTOMI** is looking better than ever. Sinking operations are still going on and at a distance of about 20 feet from the present point of work the way will be paved for opening up the rich ore body of this mine. Several hundred tons of good rock will be taken out this summer.

**ILLINOIS CENTRAL.**—We understand that arrangements are being made among the leading creditors of the Illinois Central to buy this mine, and that mine on a large scale and under favorable auspices.

A vein of unusually rich rock has been encountered recently by John Ward, who has the best of reasons for believing that he has got a bonanza at last. He struck it about 100 feet from the Silver Cord in the direction of the Elwell mine.

**ILLWILM.**—A quantity of rock, nearly six tons in all, taken from the Illwilm mine, and crushed at the Leonard mill recently. It yielded about \$35 to the ton and shows that this mine is all that we have cracked it up to be.

**M. A. BALDWIN, Esq.**, late Supt. of the Oolden Chariot mine, returned on Monday from a trip to Atlanta and Rocky Bar. He speaks in glowing terms of the magnificent mineral resources of that section of our rich Territory, and expresses the belief that Alturas county will at some future day be among the leading mining districts of the world. The mines now being worked by the Monarch and Buffalo companies embody immense treasure deposits and ought to be furnishing employment for many hundred men. Each mine has a reserve of good milling ore that will last for years to come, even if no further development be made. At present work is being carried on with a view to the extraction of ore for shipping purposes only.

### Montana.

**COPPER—Butte Miner**, July 24: Mr. A. M. Esler last week shipped to Corinne from the different copper mines of this place under his management, between 70 and 80 tons of copper ore. The entire shipments of the season Mr. Esler estimates at 800 tons, on which the freight at \$25 per ton will amount to \$20,000, to say nothing of the railway charge for transportation to Baltimore, its final destination. As there is nothing in the nature of a mystery or secret in the smelting of copper ores, it is evident that a smelter will be erected in Butte just as soon as the developments made on the copper lodes will be sufficient to prove their permanency.

The *astras*, a mile below Silver Bow, that Messrs. Gassett & Weeks have been busy for the last four months in building, will be completed and ready to commence work this week. This *astras* is almost as much of an addition to our working facilities as another mill would be, as it is confidently expected to work four tons of ore per day. It is driven by a 24 foot overshot wheel and has two *astras* beds each 12 feet in diameter, and is well provided with all the appliances necessary for amalgamating silver ores. It is the intention of its owners to employ it chiefly on custom work.

In the La Plata mine but four men are now employed on each shift, as there is no work going on further than the running of prospect drifts. A good deal of trouble is given by the water which increases in amount as the lateral drifts are extended. The shaft is down to the depth of 210 feet, not perpendicular, but on a slight incline, and no further sinking will be attempted without steam. The water is taken up in a metallic water valve that holds over fifty gallons and is hoisted by a whim worked by one horse.

### Utah.

**SANDY.**—Cor. Salt Lake *Tribune*, July 20: The Mingo has its new roaster, and making preparations for the erection of new boiler and engine that will be of sufficient force to run the increase of stacks it is intended to erect within a short time. The Fligstaff, under the management of A. W. Geist, will show a good yield for this month, as it jugs along with its four stacks regularly.

**BIGHAM.**—Ed. Eagan & Co. are erecting a 10-stamp mill, to be run by an engine, on main Bingham, for the purpose of concentrating ore. Above Eagan & Co. is the water mill of Silas McGuire, who has just taken to the city 60 tons of concentrated ore. Further on, and at the entrance of Bear gulch, jiggers are at work on Nez Perce ore. Up main Bingham to Highland, the next change we note is at the Spanish mine, where they are now placing in position an engine and boiler, doing away with the old water wheel. Next on the list is the new Jackson mill, of 10 stamps, now being completed, and will be ready for work next Monday. New shafts and dumps are built. On the side of the mountain, above Highland, is the Orphan Boy. The mine has a fine body of ore in sight. The Oray Eagle, on the opposite side, is worked under lease by Toole & Monahan, who have a fine lot of ore in the city for sale. Crossing the range over to Muddy, the first claim we come to is the Hooper. A large amount of work has been done on this claim and large bodies of ore are in sight. The Last Chance is now being worked by Mr. James W. Hamilton, who has leased the same. This will be encouraging news to the company in London, as it will fully demonstrate to them that they have a paying mine. It is rumored, and with some truth, that the company intend at no distant day to put in suitable machinery for the further development of their property. And, when in operation, it will prove one of the best mines in Utah. The Saturn is worked by Bennett & Watson. They are extracting some rich ore, and have considerable on the dump. We hear

of several new mills about to be erected in this vicinity, and certainly there is no better field for the operation of attention of mill men than this camp, as there are large amounts of ore awaiting reduction and concentration.

### New Incorporations.

The following companies have filed certificates of incorporation, in the County Clerk's office, at San Francisco: **STANDARD OIL CO.**—July 27th. Location: California. Capital stock, \$2,500,000. Directors—F. B. Taylor, A. J. Bryant, M. L. McDonald, D. O. Schofield and D. C. Scott. **THE PUNTA ARENA RAILWAY AND LUMBER CO.**—July 25th. Object: To operate a railroad running from Point Arena harbor into the lumber regions of Mendocino county, a distance of twenty miles, and to a general lumber business. Directors—J. W. Tripp, Wm. Booth, Joseph S. Kohn, D. Freeman, and Geo. T. Tolman. Capital, \$2,600,000.

**BUNKER HILL M. CO.**—July 25th. Location: California. Capital stock, \$10,000,000. Directors—R. E. Brewster, Edmund Green, M. A. Kerr, Daniel Doherty, F. McIntyre. **CALIFORNIA AND ARIZONA MINING AND REAL ESTATE CO.**—July 25th. Object: To deal in mines and real estate in Arizona and New Mexico. Directors—J. B. McKee, Henry R. Ewalt, Levi Bashford, E. P. Head, John C. Hayes. Capital, \$200,000.

**VENTURA M. CO.**—August 1st. Location: Elko Co., Nev. Capital stock, \$10,000. Directors—Robert Sherwood, John McNally, W. C. Hendrie, W. F. Bean and W. E. Reed. **NEVADA CO. M. CO.**—August 1st. Location: Capital stock, \$10,000. Directors—F. A. Wilder, A. W. Sisson, D. Libby, Ira O. Holt and Joseph Pontecost.

**GOLDEN FLEECE GRAVEL M. CO.**—August 1st. Location: California. Directors—John Leddy, W. A. McDougal, A. Wason, John Oliver, F. Schirmler. Capital stock, \$33,000.

**SILVER KING NORTH M. CO.**—July 20th. Location: Arizona. Capital stock, \$10,000,000. Directors—Jas. Walsh, W. E. Hale, Leon Well and Camilo Martin. **SANTA RITA M. & S. CO.**—July 20th. Location: Inyo county. Capital stock, \$3,000,000. Directors—J. M. Tinoco, Jose Carrascosa, Jose Schleiden, Thomas Breen and J. B. Arrambide.

**INCA M. CO.**—July 21st. Location: Aztec district, Arizona. Capital stock, \$10,000,000. Directors—W. O. Graham, A. K. P. Safford, C. A. Page, John Haynes and S. B. Benedict.

**BESSER M. CO.**—July 23d. Location: Idaho. Capital stock, \$75,000. Directors—M. Eisler, Oustave Lang, Chas. E. Morgan, Andrew Baird and H. B. Williams.

### Argentiferous Hematite.

**EDITORS PRESS.**—In reading an old number of the PRESS, I saw an article from the pen of Prof. Hanks describing a variety of argentiferous hematite. As Prof. Hanks has decided, this is not a new mineral. It is found in several localities in Arizona and New Mexico, but I have never heard of its being found elsewhere.

Large deposits of this substance have been found in Globe mining district, where it is much prized as a flux in smelting copper. Singularly enough, it is often found in veins that are rich in carbonate of copper. The mineral is generally quite pulverulent, is nearly always micaceous, and when rubbed upon the palm of the hand has the appearance of graphite, for which it is frequently mistaken.

The silver which it contains is accidental and varies in amount. Frequently it contains none, but occasionally it gives a very high result, not only in silver but also in gold.

The silver is, I believe, always combined with either chlorine, bromine, or iodine. A fragment of a very rich specimen, which came from near Prescott, gave the following approximate analysis:

Oxide of iron.....	89.3
Oxide of manganese.....	3.4
Iodide of silver.....	7.1
Total.....	99.8

In this specimen there was no doubt about the presence of the iodine, or of its being in combination with the silver—a matter concerning which Prof. Hanks was somewhat in doubt. Other specimens which I have had have given a reaction for chloride of silver.

There was a prevailing impression at one time among the miners of Globe district that this substance was a "red oxide of silver."

J. W. REDWAY.

Los Angeles, July 25th, 1877.

### Borax.

The borax trade, which was at one time not long since a very prosperous and apparently increasing one, has declined in extent so that most of the Nevada refineries are idle. The deposits of borax in Churchill and Esmeralda counties in that State are remarkably productive and practically inexhaustible. The importations of borax, which escapes the duty on manufactured articles, prevent the working of these deposits to a profit, so that the mines have been compelled to shut down entirely.

There is one large English house which completely controls this article of commerce, as other houses control quicksilver in Europe, and here manganese, asbestos, chrome ores, etc. This house has it in its power to put the price down so low that it will not pay to produce here, and when they found that competition was likely to affect their interests here, they reduced the price lower and lower, until our miners were compelled to give in. At the same time they have their eyes on the Pacific coast deposits, and it was only a few months since that one of their emissaries was here examining the mines. If they get the control they desire, it is probable that some of the mines will again be worked, but not unless in their interests.

The public debt statement shows a reduction during July of \$818,904. Coin in the Treasury, \$97,803,950; coin certificates, \$37,807,300; currency in the Treasury, \$9,811,956.

### General News Items.

A DELEGATION of Sioux Indians will visit Washington for the purpose of holding an interview with the officials of the Interior Department.

ADVICES from Ecuador state that the damage done by the late eruption of Cotopaxi, amounts to over \$1,000,000. Many lives were lost, and over 1,500 head of cattle destroyed.

The police force in this city has been doubled, the hanks advancing the money to pay the men and the city, through the Supervisors, has pledged its credit for repayment of the advance.

THE American flag has been hoisted at Samoa; and unless the action of the consul is repudiated by the authorities at Washington, the islands of the Navigators group will henceforward have to be accounted as in the possession of the American Government.

THE famous Newberry will case, of Chicago, has been decided in favor of the heirs. Should the State Supreme Court confirm this decision, North Chicago will come into immediate possession of two to three million dollars, to be used in founding a public library.

THE Marquis of Salishury, Secretary of State for India, gives a very gloomy view of the famine. The prospects in India have, during the last few weeks, become more gloomy. Advances from Bombay state that refreshing rains have fallen; and rice has declined two rupees and supplies are increasing.

THE committee appointed to examine into the condition of the Charter Oak Life Insurance Company, report that under a proper economical management the company can be made to pay its legal liabilities in full. On the report of the committee a plan for the reorganization of the company was effected. The old officers resigned and a new board was chosen.

### Mines and Surveys.

Connected with the War Department is a corps of surveying engineers, the chief of which, Lieutenant G. W. Wheeler, recently visited this city. The result of the surveys is really for the use of the War Department—to put into the hands of our officers charts explaining the best facilities for transportation of troops and supplies, the necessity for such accurate information having been severely felt in some cases during the civil war; but in the course of the prosecution of this work other matters of as great importance to the community, particularly the mineral yield of the country, are looked into. All the information obtained goes to the War Office, and the operations of this force are under the control of the Secretary of War. This engineering corps takes the place of the old Topographical Bureau which existed up to the year 1862. It is carrying on, so far as possible, the work commenced by that bureau, and in thus trying to secure a better geographical knowledge of the country the Government is following the worthy examples set by European nations 70 and 100 years ago. Knowledge is strength, and so the Prussians found it in the late Franco-German war; for to a superior topographical knowledge of the country is very largely attributed their success, and it is of paramount importance that we should be well informed respecting our own country. The corps of engineers is only small, and works slowly, sometimes being delayed for want of funds. At present it is close by our side, and may develop something of interest. The party is divided into three sections, one having its headquarters at Fort Lyon, on the Arkansas; a second in Utah, operating from Ogden; the third in this State. This last party is divided into four sections, one having specially been appointed to survey the district of Virginia City, Carson City and Reno, in which there is a difference of altitude ranging from 4,200 to 11,000 feet, giving an idea of variation in altitudes, of which so little is at present known. But another special party of this surveying company will attract more attention than the former, and their doings and reports be watched for very eagerly by a portion of the community, for in the discharge of its duties it is likely to examine the Comstock lode and Sutro tunnel, and what may be the outgrowth of their report it would be foolish to endeavor to predict.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

## Mining and Other Companies.

Persons interested in incorporated shares will do well to recommend the publication of the official notices of their companies in this paper, as the cheapest appropriate medium for the same.

## Bella Union Quicksilver Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Napa County, California. Notice—There are delinquent upon the following described stock, on account of assessment No. 2, levied on the twenty-eighth day of June, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Cert.	No. Shares.	Amount.
Donnell, E. J.	36	100	\$10 00

And in accordance with law, and an order of the Board of Directors, made on the twenty-eighth day of June, 1877, so many shares of each parcel of such stock as may be necessary, will be sold at public auction, at the office of the company, No. 312 Montgomery street, San Francisco, on Saturday, the twenty-fifth day of August, 1877, at the hour of twelve o'clock, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

ABM. HALSEY, Secretary.  
Office—No. 312 Montgomery Street.

## California Fruit Growing Association.

Principal place of business, San Francisco. Location of property, El Dorado county, Cal.

Notice is hereby given, that at a meeting of the Board of Directors, held on the second day of July, 1877, an assessment of \$1.50 per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at 331 Sansome Street, S. F.

Any stock upon which this assessment shall remain unpaid on the sixth day of August, 1877, will be delinquent, and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twentieth day of August, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

HORACE JONES, Secy.  
Office, 331 Sansome Street.

## Cherokee Flat Blue Gravel Company.

Location of principal place of business, San Francisco, California. Location of works, Cherokee, Butte County, California.

Notice is hereby given that at a meeting of the Board of Directors, held on the ninth day of July, 1877, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold coin, to the Secretary, at the office of the company, room 1, No. 402 Montgomery Street, San Francisco, California.

Any stock upon which this assessment shall remain unpaid on the twenty-fifth day of August, 1877, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the seventh day of September, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of Board of Directors.

O. H. BOGART, Secretary.  
Office—Room 1, No. 402 Montgomery Street, San Francisco, California.

## Excelsior Silver Mining Company.

Location of principal place of business, San Francisco, California. Location of works, Potosi District, Lincoln County, Nevada.

Notice is hereby given that at a meeting of the Board of Directors, held on the tenth day of July, 1877, an assessment of ten cents per share was levied upon the capital stock of the corporation, payable immediately in U. S. gold and silver coin, to the Secretary, at the office of the company, 306 Post Street, San Francisco.

Any stock upon which this assessment shall remain unpaid on the tenth day of August, 1877, will be delinquent and advertised for sale at public auction, and unless payment is made before, will be sold on Monday, the twenty-seventh day of August, 1877, to pay the delinquent assessment, together with costs of advertising and expenses of sale.

W. A. KOLLMYER, Secy.  
Office, 306 Post Street, San Francisco.

## Mariposa Land and Mining Company.

California—Location of principal place of business, San Francisco, California. Location of works, Mariposa County, California.

Notice—There is delinquent upon the following described stock, on account of assessment, No. 11, levied on the sixth day of June, 1877, the several amounts set opposite the names of the respective shareholders, as follows:

## Iron and Machine Works.

### PACIFIC ROLLING MILL COMPANY,

SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON

Every Variety of Shafting,  
Embracing ALL SIZES of  
Steamboat Shafts, Cranks, Piston and Con-  
necting Rods, Car and Locomotive  
Axles and Frames,

Hammered Iron of Every Description and Size

Orders addressed to PACIFIC ROLLING MILL  
COMPANY, P. O. Box 2032, San Francisco, Cal., will re-  
ceive prompt attention. OFFICE: 16 First Street.  
The highest price paid for Scrap Iron.

### THE RISDON Iron and Locomotive Works,

INCORPORATED.....APRIL 30, 1868  
CAPITAL.....\$1,000,000.

LOCATION OF WORKS:

Corner of Beale and Howard Streets,  
SAN FRANCISCO.

Manufacturers of Steam Engines, Quartz and Flour  
Mill Machinery, Steam Boilers (Marine, Locomotive and  
Stationary), Marine Engines (High and Low Pressure).  
All kinds of light and heavy Castings at lowest prices.  
Cams and Tappets, with chilled faces, guaranteed 40 per  
cent. more durable than ordinary iron.

Directors:

Joseph Moore, Jesse Holladay, C. E. McLane,  
Wm. Norris, Wm. H. Taylor, J. B. Hagglin,  
James D. Walker.

WM. H. TAYLOR.....President  
JOSEPH MOORE.....Vice-President and Superintendent  
LEWIS R. MEAD.....Secretary

THOS. PENDERGAST. HENRY S. SMITH

### ÆTNA IRON WORKS,

MANUFACTURERS OF

### IRON CASTINGS and MACHINERY

OF ALL KINDS.

Fremont Street, Bet. Howard and Folsom

SAN FRANCISCO.

### SHEET IRON PIPE.

### Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON and ASPHALTUM  
PIPE, of any size and for any pressure, and contract to  
lay the same where wanted, guaranteeing a perfect work-  
ing pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special pat-  
terns for Mining Cars. These small wheels are made of  
the best Car Wheel Iron, properly chilled, and can be  
fitted up with the improved axle and box—introduced by  
this company, and guaranteed to outlast any other wheels  
made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

### SACRAMENTO BOILER WORKS,

37 Fremont St., cor. Mission, S. F.

### HALL & KELSHAW,

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks,  
Hydraulic Pipe, Oil or Water Tanks, Ore and  
Water Buckets, Gasometers, Orders, Bridges  
and Iron Ship Building.

### ALL KINDS OF SHEET IRON WORK.

Repairing promptly attended to at the  
lowest possible terms.

### STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz  
Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron  
Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

### Miners' Foundry and Machine Works, CO-OPERATIVE,

First Street, bet. Howard and Folsom, San Francisco

Machinery and Castings of all kinds.

### McAFEE, SPIERS & CO.,

BOILER MAKERS AND  
GENERAL MACHINISTS,  
Howard between Fremont and Beale Sts., San Francisco

## PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,  
RANKIN, BRAYTON & CO.,

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY  
INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS,  
CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES,  
FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES,  
RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES,  
SUGAR MILL MACHINERY, WATER WHEELS, Etc., ALL OF THE  
LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster  
Rock Drill and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

## IMPROVED PORTABLE Hoisting Engines,

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery.

### PHELPS MANUFACTURING COMPANY,

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle  
Work, Car Frames and Bolts, Machine  
Bolts, Set Screws and Tap Bolts,  
Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS.  
HOT AND COLD PRESSED HEXAGONAL AND  
SQUARE NUTS, WASHERS, BOLT ENDS,  
TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,  
SAN FRANCISCO, CAL.

### THOMPSON BROTHERS, EUREKA FOUNDRY,

Light and Heavy Castings of Every De-  
scription Manufactured.

Solo Proprietors and Manufacturers of  
Lynch's Ventilating and Illuminating Tile,  
The Only Illuminating Tile Manufactured for Light-  
ing Cellars, Basements and Dark Rooms which pro-  
vides proper ventilation for such places.

129 and 131 Beale Street,  
BET. MISSION & HOWARD, SAN FRANCISCO

### CALIFORNIA BRASS FOUNDRY,

No. 125 First Street, Opposite Minna,  
SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt  
Metal Castings, Brass Ship Work of all kinds, Spikes,  
Shcathing Nails, Rudder Braces, Hinges, Ship and Steam-  
boat Bells and Gongs of superior tone. All kinds of Cocks  
and Valves, Hydraulic Pipes and Nozzles, and Hose Cou-  
plings and Connections of all sizes and patterns, furnished  
with dispatch. PRICES MODERATE. J. H. WEED. V. KINGWELL.

### California Machine Works,

119 BEALE STREET, SAN FRANCISCO.

### BIRCH, ARGALL & CO.,

Builders of QUARTZ, SAW AND FLOUR MILLS,  
Keating's Sack Printing Presses,  
THE ECONOMY HYDRAULIC HOIST FOR STORES,  
And General Machinists.

## Machinery.

### The Ingersoll Rock Drill

Is Extensively Used in the East and

TAKES THE PLACE OF ALL OTHERS,  
Wherever introduced, because it can be run with less  
power, labor and repairs, and do more work than any  
other drill in the market. It has but few parts, is easily  
handled, being light, and has AUTOMATIC FEED, which  
saves labor. WE ASK FOR TRIAL AGAINST ANY  
COMPETITOR. For particular information regarding  
Drills or Air Compressors, send for circular to

J. B. REYNOLDS,  
320 Sausome Street  
(Room 10.)

### The Gardner Automatic Governor.

MORE THAN TEN THOUSAND NOW IN USE.  
EVERY ONE WARRANTED.

SEND FOR DESCRIPTIVE CIRCULAR AND  
PRICE LIST.

When all others fail, buy a "Gardner." We have  
all sizes of these celebrated Steam Governors on hand  
at all times.

BERRY & PLACE,  
Selling Agents for the Pacific States,  
Cor. Market & Fremont Sts., S. F.

### THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any  
gold or silver ores that are not more profitable for smelt-  
ing. Will also desulphurize ores and put them in proper  
shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons  
in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—21 Cords at 38 per cord.....	5 25
Salt—1,600 lbs at 2½ cents.....	40 00

Cost of 20 tons.....\$52 25  
Cost of one ton.....2 61½

In a furnace of three or four times this capacity the  
cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Con-  
solidated Co.'s mines, in Peavine District, Nev., and at  
the Exchequer mill, Alpine Co., Cal. For further infor-  
mation, apply to

D. J. O'HARRA,  
Reno, Nevada.

### BAKER'S ROTARY PRESSURE BLOWER (FORCED BLAST.)

WARRANTED SUPERIOR TO ANY OTHER.  
J. C. Sanderling, Sole Agt Pacific Coast,  
51 Fremont Street, S. F.

### THE LANE & BODLEY COMPANY,

John and Water Sts., Cincinnati, O.,

Sole Manufacturers of

BRUCKNER'S PATENT  
REVOLVING FURNACE,  
For Chloridizing, Desulphurizing and  
Roasting Ores.

—ALSO—

STEAM ENGINES, SAWMILLS, SHAFTING, GEAR-  
ING AND MINING MACHINERY.

Send for our Illustrated catalogue.

## Metallurgy and Ores.

### JOHN TAYLOR & CO.,

Importers of and Dealers in

ASSAYERS' MATERIALS,  
CHEMICAL APPARATUS AND CHEMICALS, DRUG-  
GISTS' GLASSWARE AND SUNDRIES, Etc.

512 & 518 Washington St., San Francisco.

We would call the special attention of Assayers, Chem-  
ists, Mining Companies, Milling Companies, Prospectors,  
etc., to our stock of Clay Crucibles, Muffles, Dry Cups,  
etc., manufactured by the Patent Plumbago Crucible  
Co., of London, England, for which we have  
been made Sole Agents for the Pacific Coast. Circulars  
with prices will be sent upon application.  
Also, to our large and well adapted stock of

Assayers' Materials & Chemical Apparatus,

Having been engaged in furnishing these supplies since  
the first discovery of mines on the Pacific Coast.  
Our Gold and Silver Tables, showing the value per  
ounce Troy at different degrees of fineness, and valuable  
tables for computation of assays in grains and grammes,  
will be sent free upon application.

JOHN TAYLOR & CO.

### THOS. PRICE'S

### Assay Office and Chemical Laboratory,

524 Sacramento St., S. F.

Deposits of bullion received, melted into bars, and re-  
turns made in from 24 to 48 hours.

Bullion can be forwarded to this Office from any part of  
the interior by Express, and returns made in the same  
manner.

Careful Analysis made of Ores, Metals, Soils, Waters,  
Industrial Products, Etc. Mines examined and reported  
upon. Consultations on Chemical and Metallurgical  
questions.

### Nevada Metallurgical Works,

These goods are specially  
adapted for the use of  
FARMERS, MECHANICS,  
MINERS, and WORKING  
MEN in general. They  
are manufactured of the  
Best Material, and in a  
Superior Manner. A trial  
will convince everybody of  
this fact.

Patented May 12, 1873.  
USE NO OTHER, AND INQUIRE FOR THESE  
GOODS ONLY.

TWELFTH INDUSTRIAL EXHIBITION,

UNDER THE AUSPICES OF THE

MECHANICS' INSTITUTE, SAN FRANCISCO, AUGUST 7th, 1877.

The Board of Managers have the honor to announce that the TWELFTH EXHIBITION will be opened to the public on TUESDAY, AUGUST 7th, 1877, and continue open for at least 30 days thereafter. The Exhibition will be held in

THE GRAND PAVILION,

Market, Eighth and Mission Streets, and easily accessible by six lines of City cars.

THE EXHIBITION BUILDING---EXOTIC GARDEN---MECHANICAL ANNEX.

The BUILDING is 200 feet wide, 550 feet long, and 100 feet high, with a gallery around the inside 50 feet wide, beside a promenade 16 feet wide and 1,000 feet in length, from which an unobstructed view of the interior is obtained. In addition to the above space there will be an EXOTIC GARDEN, 70 by 220 feet, for the display of the Fruits and Flowers of this Coast. Also, A MECHANICAL ANNEX, 200 by 50 feet, for the display of special Machinery. A large and powerful engine will furnish the motive power for all machinery required to be in motion, while steam and water will be supplied in ample quantities to such machines or appliances as require them. The main line of shafting is 500 feet in length, with sufficient pulleys for all requirements.

THE ART GALLERY

Is 400 feet in length and 50 feet wide, well lighted by skylights during the day and at night by the most improved reflectors. It will be made specially attractive, both in Pictures and Statuary. Many noted works of art are already promised, and it is confidently expected this department will excel anything ever before seen on this coast. Over 6,000 gas lights will be used to illuminate the building during the evening. Four thousand seats will be provided for visitors. Also, a first-class restaurant, where refreshments of all kinds can be obtained at moderate prices.

A GRAND INSTRUMENTAL CONCERT

Will be given each afternoon and evening by an orchestra composed of the best musical talent on this coast, and under the leadership of an experienced and popular conductor.

PREMIUMS.

In accordance with the general request of exhibitors, the management have decided to offer liberal premiums at this Exhibition, consisting of medals and cash, all to be for the first degree of merit only. The medals will be of a new design, three and one-half inches in diameter, and similar to those awarded at the late Centennial exhibition.

A carefully prepared classified list of premiums will shortly be published.

Articles may be entered for competition or for exhibition only; if for the former they must be so designated when placed in position.

It is important that all parties intending to contribute to this Exhibition should give early notice of the amount and kind of space required.

A copy of the premium list, blank applications for space, rules and regulations, and any information regarding the Exhibition will promptly be given or sent by addressing the Secretary of the Twelfth Industrial Exhibition, San Francisco, Cal.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS OFFICE, S. F.

BY GUIDO KUSTEL,  
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty.

Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers, containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

## Testing and Working Silver Ores.

The above is the title of an illustrated work of 114 pages, for miners and prospectors, by Chas. H. Aaron, which has just been issued by Dewey & Co. Mr. Aaron has managed to give many useful hints and suggestions, free from all technicalities, and in such a style as to be easily comprehended. It is written for the miner, with no chemical symbols or metallurgical technicalities to confuse those who are not chemists or metallurgists. The following summary of the contents of the work will give an idea of its scope.

Under the heading of the first chapter, "Testing Ores for Silver," we find paragraphs on ore formation, test for silver, with heat and water, acid or blow pipe. In speaking of testing for a process, the extent and richness of ore is considered, smelting ores, selecting and working sample, appliances for testing, roasting, etc. Under the head of "Working Ores" the author describes Aaron's process, bas something to say of superheated steam, preparation of dichloride of copper and protochloride of copper, use of copper and iron, quantity of chemicals, carbonate of lime, chloride ores, amalgam, Patehen's process, etc. He also describes the methods of working roasted ores, treatment of base metals, stirring, heat of furnace, want of sulphur, etc. Under the head of "Leaching Processes" are the titles, Smelting, Mexican process, Chilean process, Kroschke's process, etc. Under "Pulverizing Machines" are described the arastra and its construction and operation, stamp batteries, screens, Crocker's trip-hammer battery, Paul's pulverizing barrel, Kendall's battery, Noice's pulverizer, a cheap rock breaker, etc.

In speaking of amalgamators the author describes a cheap amalgamator, grinding the ore, directions for making a barrel, preventing mechanical wear, use of quicksilver, copper in bars, Freiberg barrel, cheap barrel trough, barrel on rollers, Aaron's amalgamator, separator, etc.

He describes an improvised retort, roasting furnace, furnace tools and furnace building. Among the miscellaneous mention may be found Aaron's leaching apparatus, with two or three different arrangements, a small mill, sampling tailings and settling tanks, dichloride of copper, etc. Mr. Aaron is a practical miner, of long working experience on this coast.

The book is a serviceable one for miners' and prospectors' use. Price, post free, \$2.00. Address Dewey & Co., MINING AND SCIENTIFIC PRESS, 224 Sansome Street, San Francisco.

## Locating and Describing Mining Claims.

Who May take up Claims on the Public Lands and How it Should be Done.

The Colorado Springs Gazette, of recent date, contains an article directing minors as to the mode of procedure proper to be observed in the locating of claims, illustrating the same with a diagram, and which, if the subject had been treated a little more fully, as we purpose doing in the present writing, would have been of great service to the prospector.

The law enacted by Congress, May 10th, 1872, the provisions of which are still in force, declares all mineral deposits in land belonging to the United States to be free and open to exploration and purchase, and the lands in which such deposits are situated to also be free and open to occupation and purchase by the citizens of the United States, and by those who have declared their intention to become such, under regulations prescribed by law, and according to the local customs or rules of miners in the mining district where such deposits are situated, in so far as such rules and customs are applicable and not inconsistent with the laws of the United States.

Under the term mineral deposits is here intended to be included every kind of metal and mineral, gold, silver, iron, tin, coal, salt, sulphur, etc., though the quantity of land that may be claimed, and the provisions under which it is to be secured and held, vary somewhat with the character of the deposit taken up.

### Violating the Statute.

This law, as will be seen, is very clear and specific as to the class of persons who are to be permitted to enter upon and occupy the public lands for the purposes of mining. They must either be citizens of the United States or persons who have declared their intention to become such; no others have any right to explore or purchase the mineral deposits on the public domain, nor yet, according to a strict interpretation of the law, to be in the occupation of the lands in which such mineral deposits are found.

There are at the present time not less than 50,000 people engaged in mining on territory belonging to the United States, who are not citizens, and who have never declared their intention to become such, being, in fact, ineligible to naturalization. We refer, of course, to the Chinese, who, for more than a quarter of a century, have been suffered to mine on the public domain, except as they were prohibited from doing so by the local regulations of certain districts, and who of late years have been pouring into the mineral regions by every avenue of travel, and there, either through location or purchase, have possessed themselves of mining claims without let or hindrance.

The prohibitory clause quoted was engrafted upon the statute regulating this subject; with special reference to this class of foreigners, who it was not intended by Congress should be allowed to enter upon our mineral-bearing lands, and there quietly appropriate and carry away their valuable contents to their rapid impoverishment and the prejudice of our own citizens. To read this statute by the purpose of its framers, it would declare in the most positive terms that no person of Mongolian origin shall be permitted to mine upon or even occupy this portion of the public domain. It will be observed that the law declares that this class of persons shall not only be debarred from exploring and purchasing these mineral lands but also from their occupation. They have no right to be on them. Their very presence is a trespass, since they are there inferentially for the purpose of mining; and why these intruders upon our common heritage have not been sooner ejected therefrom is a matter that those intrusted with the execution of the law should feel called upon to explain.

Supposing the party desirous of taking up a mining claim has a legal right to do so, he will first examine and see that there is no valid prior claim in the way. There being none, and the location to be made being on a lode or vein, he will ascertain as near as may be where is the most valuable portion of the same and there place his central stake, due regard being

had to the natural facilities that exist for exploration and ore extraction.

Under existing laws 1,500 feet or less, but no more, may be taken up on any lode or vein by one person or company, the number of feet claimed to be stated on the notice, which must be signed by all the claimants, and set forth how many feet are claimed on each side of the central post or stake on which the notices are affixed and the direction in which the same extends. For this purpose, the following form might answer, heading the same:

### Notice!

We hereby give notice that we have this day of —, A. D. 187—, located this the (here insert the name of the ledge or vein, and also of the claim taken up). We claim 1,500 feet in and along the vein, linear and horizontal measurement. We claim 1,200 feet along the vein running in a northwesterly course from this central stake and notice (or discovery shaft if one has been sunk), and 300 feet running along the vein southeasterly from the same. We also claim 150 feet, on each side of this vein from center of crevice, as surfaces ground.

A. B. } Locators.  
C. D. }

It would also be well to mention in the notice the name of the district, if one has been organized, in which the claim is located.

As the law requires that all locations shall be

so distinctly marked on the ground that their boundaries can be readily traced, locators should be careful to describe them by reference to such permanent natural objects as may be in the vicinity, and also put up centrally and at all angles large posts, indicating clearly the outlines of their claims, as shown in the above diagram.

The curved line running centrally across the cut denotes the position and course of the vein; the cross above it the site of the location post or stake, and the circle below that of the discovery shaft. Stone or other durable monuments may be substituted for posts, or these may be made to supplement the use of the latter where considered necessary. The more readily a location can be identified by such description and monuments, the more secure the claimant's title.

The old practice of setting forth in the location notice a claim to all the spurs, dips, angles, etc., of the ledge, is superfluous, since these are declared to belong to it by the law.

### Recording Claims.

Within 20 days, or what under the circumstances might be considered a reasonable time, after making the location, notice thereof, fully describing the claim, must be filed for record with the district Recorder, or if there be none,

then with the Recorder of the county in which the claim is situated.

### Expenditures Required.

Within one year from the time that a claim is located, whether it contained 1,500 feet or less, \$100, at least, in work or improvements must be expended upon it, and the same every year thereafter until it is patented. Where there is more than one claimant interested in a location, this expenditure may be made on any one or more of the joint claims, or on a tunnel designed for their development. From this provision, claims located prior to May 10th, 1872, are excepted; an annual outlay of \$10 for every 100 feet answering in this case. Failure to make this required expenditure as above stated, renders all claims liable to relocation. If locators fail to make the proper expenditure within the year, but do it before any relocations made, they will save their claims.

### Blind Lodes.

As no claim can be recorded till the vein or lode has been discovered within its limits, the claimant must, when it cannot be traced on the surface, open the ground sufficiently to determine its presence, and, if possible, also its course, as a means of enabling him to fix his surface location. Applicants for patents for lode or vein locations pay at the rate of \$5 for every acre and fractional part of an acre contained therein.

### Placer Claims.

Of placer grounds, no person can take up more than 20 acres, and no association or company, which shall be composed of at least eight bona fide locators, more than 160 acres, the government prices of placer mines being fixed at \$2.50 per acre. The proceedings to be observed in taking up and securing this class of locations, and in obtaining patents therefor, are, in the main, similar to those required in the case of vein mines, the amount of work demanded to be done upon them being governed by local regulations.

As a means of posting himself fully in regard to the laws governing these matters and the locating of coal and various other mineral producing lands, every miner should procure a copy of the United States laws lately compiled and for sale at the office of this paper.

The Mionietta Belle has been listed on the San Francisco Stock and Exchange Board. The mine is in Inyo county, and is at present furnishing ore to a ten-stamp mill. It is claimed that there is now on the dumps and in the stopes a value of \$200,000 in ore, and it is expected that \$30,000 per month will be produced for some time. The company own three mines.

The Virginia Chronicle says: The recent advance in the price of quicksilver will increase the cost of milling silver ores by about \$1 per ton, and the opinion of well-informed parties is that the price will go still higher. The average loss of quicksilver in working ores by the Washoe process is two pounds per ton.

## Cochrane's Improved Cam.

The illustration given herewith shows an improved cam for quartz mills, invented by T. A. Cochran. This sectional cam has been thoroughly tested and proved to be a success, and is indorsed by the most experienced mill-rights and millmen on the coast.

A good and successful sectional cam has long been wanted to make the battery a more perfect machine. Like the gib lappet, it takes the place of the crude and old-fashioned concern that was always getting loose and causing stoppage of this mill and consequent loss of time and money. One of the most important claims for this cam, is its reliability and the impossibility of its getting loose when properly keyed to the shaft. The cam is convenient as regards moving and putting on the shaft, and when the key is driven, it secures it firmly, drawing the sections together and forming a firm base for the heavy and constant strain of the cam. The old cam has its key driven next to the shaft, forcing the cam off from the shaft, weakening the hub and leaving it liable to rock on the key and get loose. After it does become loosened, it is necessary to take out the whole shaft and move the other cams to get out the key.

All this trouble is remedied in the Cochrane sectional cam. The sections can be taken off and new ones put in use in fifteen minutes, without moving the shaft or the rest of the cams. The engraving shows plainly how the cam is put on. The ring is slipped over the hub and the key driven between the ring and hub. The cam is strong and durable as well as very convenient, and little liable to get loose. Further information concerning this cam may be had from J. Hendy, corner Mission and Fremont streets, the Union Iron Works, Pacific Iron Works, Risdon Iron Works, Miners' or Fulton foundries, or from the inventor, T. A. Cochrane, Morton House, in this city.

## A New Horse Boot.

An illustration on this page shows a recent claimed improvement in horse boots, which we show as a matter of news and interest to our horse men. The inventor, Mr. J. Fennel, of Cythiana, Kentucky, claims for this device that it protects the greatest amount of flesh and muscle, and yet is not fastened to these tender parts but to the hoof alone. The following description will explain the engraving: This boot is intended for the hind leg and is made in two pieces; the upper or speedy cut part is attached to the corona or hoof part by two small straps, which allow it to yield to every motion required. The speedy cut part is made flaring both upward and downward, and stiffened with a small wrought-iron plate, so that it cannot be crushed down, but should it be thrown out of shape by any cause, it is a very small matter to take it and shape it with the hand, and if found to press or chafe at the top or bottom, bend the plate so as to throw it out, thereby preventing it from producing so much friction upon any one point. There is a small padded strap which passes around and under the fetlock, though of no use only to keep this attachment from falling forward, and should be buckled very loose. This speedy cut extends to about the middle of the fetlock joint, and is well padded inside and is fastened to the hoof part by two small straps. The outside strap is harness leather, the inside is made of three pieces of oil-tanned buckskin, sewed through the center before putting in. Nothing else will stand at this point; the very best harness leather will not stand more than six weeks.

The hoof part is padded at the top to protect the corona, and the two small straps pass into said pad from the speedy cut attachment, which completely combines the two into one. This hoof boot is fastened on like all others, there being a strap to pass around the heel next to the shoe and buckled tight with a small iron hook on outside, which must be passed in between the shoe and hoof. This is to protect the boot from being pushed up.

IMPROVED SECTIONAL CAM.

FENNEL'S IMPROVED BOOT.

### Webber Lake and Its Attractions.

[We copy from the PACIFIC RURAL PRESS the following graphic description of one of our most entrancing mountain retreats. The description should be accompanied by engravings, and should be if, we had photographs or sketches which would enable us to produce pictures worthy of the grand and picturesque views which Webber Lake affords. At some future day we trust our artist may visit the place and give us faithful sketches, from which some idea of the peerless summer scenery of the region may be gained.—EDS. PRESS.]

The hot and long summers with cloudless skies in the great basin of Nevada and the great valley of California, render it very desirable, often necessary, that their inhabitants sometimes escape to the mountains conveniently situated between the two States, where, at the same time, the most delightful climate is experienced.

The highest and most interesting as well as health-giving retreats are inaccessible, however, except by certain gaps or

#### Passes of the High Sierra.

The most noted of these are Walker's pass, near the extreme south end of the Sierra in Kern county; next King's pass, leading to Mts. Whitney, Brewer, Tyndall and other of the highest peaks of California; next, Mono pass, connecting Mono valley and the world-famous Yosemite valley; next, Silver Mountain pass, between that celebrated peak and the Big Trees of Calaveras; next, Carson pass, leading by the crystal, azure-bued, mountain sea of Tahoe; next, Donner pass, where now winds the C. P. R. R. through 40 miles of snow-sheds and 13 long tunnels; next, Henness pass, leading to the varied attractions of the alpine lakes of Webber, Independence and Meadow; next, the low Beckworth pass, at the north end of the large and fertile Sierra valley; next, Fredonier's pass, between Susanville and the high Big Meadows, with their enormous springs; and lastly, Lassen's pass, leading by that lofty perpetually snow-clad peak in Shasta county.

#### Webber Lake and Valley.

Of all the popular resorts found on these passes the highest and prettiest, and that which proves the most satisfactory because most beneficial and cheaply enjoyed, is the noted mountain gem of Webber lake, a snow-formed, crystal sheet of water reposing in a gently sloping, basin-shaped, forest-clothed valley, occupying the highest part of the well known Henness pass through the high Sierra, 20 miles north of Donner pass and the railroad.

Webber lake is nearly circular in shape, about a mile in diameter, and nearly 7,000 feet above sea level in Lat. 39½° north by Long. 129½° west, hence the region is sub-alpine, the scenery peculiarly grand, the flora rare, often new to science, the forest open with no impeding chaparral, the fishing and hunting unexcelled, the climate cool and health-giving, the waters pure and delicious, added to all which the entertainment or medical assistance furnished by the proprietor, Dr. D. G. Webber, at his spacious hotel and sanitarium is of the most satisfactory kind, for he is a genial, efficient, liberal-hearted gentleman, and one of the most skillful, sympathetic, benevolent and successful physicians in California.

The forest immediately surrounding the lake is composed exclusively of the graceful *Pinus contorta* or California tamarack, clustered into gravel floored, flower-carpeted groves, affording cool but not gloomy shades and most romantic drives. Outside the groves, investing the bases of the mountains, is a denser growth of the several Sierra pines, decorated on its upper edge by a fringe of the dark green trees of the two rare and exquisite California firs, *Picea grandis* or white silver fir, and very rarely, *Picea amabilis* or red silver fir; the latter only found in limited alpine regions of California and by all observers admitted to be the most lovely evergreen in the world. So beautiful and desirable is it, with its regular whorls of limbs rising like a diminishing series of verdant wings, looking a straight shaft, red-painted below and white above, stuck full of immense fans, that its seed sells in London for its weight in gold, and agents of the Prussian and other European governments have been sent here to obtain seed for renewing their forests. Large sections of one of these trees that was 30 feet in circumference, were sent to the Centennial exhibition and elicited universal admiration. Another beautiful and rare tree, *Abies Pattoniani* or silver spruce, is found clinging to the sides of the highest peaks.

This enclosing forest is broken at two points on the north side of the lake by small meadows, lined with willows. Between and nearly enclosed by them extends a symmetrical grove of the tamaracks described, forming a natural site and a fortunate sun-shield for the hotel and accessory buildings, cottages for tourists, etc., located in a line skirting the lake and but a few feet from its shallow, gravel-bottomed shore.

This beautiful grove, for several rods back from, and for a mile along the lake shore, has lately been cleared of hundreds of fallen and uprooted trees, the vestiges of a terrific storm which tore through the valley from south to north several winters ago.

Across the lake at the south end a larger break in the forest is occupied by a broad mea-

dow, extending four miles up the valley and comprising several hundred acres of pasturage annually cropped by thousands of sheep. This meadow, like the floor of the groves, is smooth-laid gravel, affording excellent travel in any direction. Through its center winds a silvery streamlet fresh from snow-banks in sight the year round.

#### Passes to Webber Lake

The jagged mountain rim of the valley is deeply indented at four points by four passes nearly corresponding with the cardinal points of the compass. The low east and west passes are great gateways, for through them proceeds the once densely thronged Henness pass emigrant road; Webber lake, on the summit, being the principal station and half-way camp upon its line.

Down the east pass also flows the outlet of Webber, plunging off a ledge of rock a half mile from the lake and forming a lovely cataract and deep gorge, hereafter to be described.

The high north and south passes open to scenes similar to the Webber, but contrasting each other; the north one, threaded by a trail precipitous at a few places, leads over through a grove of *Picea amabilis* described, and down eight miles to Sierraville and Campbell's sulphur springs, in the south end of the rich and populous Sierra valley, described in last season's "Botanical Excursions," in the *Pacific Rural Press*.

It must suffice for this article to show the relations of Sierra valley to Webber lake. They are connected by the short bridge-trail described and by a good wagon road that skirts the mountain eastward and enters Webber's valley by the east pass, 16 miles. Sierra valley is also noted for its salubrious climate and for its excellent sporting.

Many tourists and families resort there annually, and a hotel costing \$12,000 has been built at the medicinal hot springs near Sierraville and Randolph, by Mr. John Campbell, a genial gentleman and an appreciative, enterprising early settler. Many magical cures are reported, and no doubt these waters are as potent to cure as celebrated springs of the lower valley, and certainly the surroundings are ten times more romantic and pleasant.

Special conveyances are furnished by Mr. Campbell whenever his guests desire to visit Webber lake.

The high south pass leads up by a good wagon road, through a grove of silver spruce, eight miles south and west to Meadow lake and the once populous town of Summit City. The scenery around this truly alpine lake is magnificent. The visitor finds himself amidst snow banks and treeless, bald, white peaks, admitting through their gaps views of other high peaks, the highest in northern California. To revel among these snow banks, bordered with quick-growing, strange and abundant flowers, during the dog-days, is a privilege easily and cheaply obtained by the habitues of Webber, for horses and vehicles are always furnished gratis to visit this and other places of exceeding interest in the vicinity.

The broken roofs of 300 houses tell a sad tale of mining failures and abandonment, but the rock is known to be rich here, only it is loaded with sulphurets. The discoverer of the ledge, Harry Hartley, has never despaired of discovering a process for removing the sulphurets, and now a French chemist has extracted sufficient gold from the rock at a rate so cheap as to inspire parties in San Francisco to invest large amounts of capital in claims and mills at Meadow lake; so the future is bright for the mines and the pleasure resort of its citizens, as of yore—Webber lake.

#### Peaks around Webber Lake.

Between the four passes described arise lofty mountains, easily climbed, and affording grand views of bare, glistening, towering peaks, with myriads of shining lakes nestling at their bases. To the southeast 10 miles, only a half-day's ride away, towers among a noble group of peaks, Mount Lola, on which is placed one of the signal stations for central California, communicating with Mount Diablo; and beyond a few miles the startling ruins of an immense castle are reared against the sky. To the southwest appears the hump-backed peak which has named itself Old Man, overlooking Meadow lake. Further south and east extend the culminating crests of the Sierras, the view ending with Job's, Tellac and Pyramid peaks, far beyond Tahoe. To the west is the black, frowning French peak, girt about with lakes, and standing out in full view of denizens of the great valley. In the northwest sky looms the sharp, many-toothed comb of Downville buttes, about 20 miles away. Further north and a little east is Haskell's peak, overlooking Sierra valley. Still further northwest, among continuous crests of the Sierra, are Saddleback, Table-rock, and Fir-top, their peculiarities distinctly visible, while away over them, 90 miles north, appearing like a vast iceberg on the horizon, shines the snow-clad, historic Lassen's peak, its sides gullied by numerous avalanches, revealing its black body of lava.

#### Short Trips at Webber's.

One of the first trips taken by all lovers of nature is performed without waiting for horse or carriage. You jump into a boat and row half a mile to the outlet and dam, then walk another half mile through clean, open woods, by the flower-bordered stream to the cataract and canyon. This beautiful fall is double: first, a plunge of 25 feet into a deep, rock lipped basin, then a sheer cataract in winter or a broken cascade in summer of 85 feet, to the floor at the

head of the deep gorge. A stairway cut in the soft rock facilitates your safe descent to the base of the cascade, where, if you have chosen a morning hour of a sunny day, you may see the misty sheet hedecked with miniature rainbows. The steep-walled gorge winds another half mile before dehouching into Scott's valley. These walls are about 200 feet high, and exhibit countless strata of rock, draped with rare ferns and flowers—an open book of geological records illuminated by floral vignettes. You gather specimens of rock, fern and flower, meditating the while upon the time when the lake above filled all the valley, and querying whether a gradual wearing of ages upon ages has excavated this gorge, or whether a fresher or cloud-hurst of more recent date tore this channel through the then soft rock—a phenomenon similar to and perhaps coeval with, but of course vastly inferior to, the eight-mile canyon of Yosemite.

Another short trip is by boat across the lake to a dense part of the forest, where are hidden, but a few rods from the lake shore, Dr. Webber's Monument, a dome of white granite rising through the trees; and just beyond, Lover's lake, green with reflections of the overhanging trees. This part of the forest is a noted bear haunt, and a log trap is built here for Bruin's inspection.

A third trip is by boat also—always a boat-ride at first—to the ice-cold spring and Botany meadow on the west side of the lake. This spring is singularly cold, too cold to drink until tempered a little by exposure to air or mingled with lake water. A huckelful is always brought back in the boat to regale the stay-at-homes. The meadow is variegated with colors, showing where grow rare and interesting flowers, among them four species of *Gentian*, one a new species; a new *Ranunculus Lemmonii*; a new *Silene montana*; the little *Sagina Linnaei* and a one-flowered clover; the violet-like *Parterella carnosula*, etc., with hosts of more familiar flowers and a near grove of *Picea amabilis*.

A fourth trip is by wagons and saddles to Lake of the Woods, on the top of the mountain back of the hotel. This lake is about 80 rods long and half as wide, completely hidden in the dark forest of fir and tamarack. Beyond it a few rods is a high crest, the Observatory, vertical on the north side, overlooking Sierra valley and the peaks beyond. This trip and the scenery is generally highly enjoyed, especially by the youngsters, who love to tumble rocks down the cliff.

#### Longer Trips at Webber's.

The next four trips are each eight miles long and are connected one with each of the four passes. The first one with horses, the rest with vehicles also, and generally each is made the occasion of a social picnic. The north trip is to Sierra valley and Campbell's sulphur springs; the east one to Independence lake, to revel in the grand scenery of its steep, abruptly enclosing mountains; the third to Meadow lake, with its snow-banks and sublime views of peak and gorge; the fourth is westward to Jackson's old station and the picnic grounds on the Middle Yuba.

#### Excursion to Castle Peak.

Another grand trip, entitled by its extent and diversity to be called an excursion, is often taken by the tourists at Webber's who have the requisite strength and nerve, and in the latter regard ladies have often proved the best campaigners. For this excursion you require strong, trusty animals and an extra one or two packed with provisions for two or three days, blankets, etc. The writer takes this excursion every season, sometimes alone, and is always richly rewarded. Some new lake or glen, generally a new plant, is found every trip. The objective point is Castle Peak, distant about 18 miles south-east, as the bird flies, but to reach it you climb several ridges, traverse innumerable valleys and wind around lakes and peaks in delightful profusion. Chiefest of the interesting objects passed in order are Lookout point and Bear valley, Emerald lake and Sliding rock—the latter weighing many hundred tons has but lately left its ledge on the top of a near peak; White rock peak and lake, the latter shining like molten silver in its granite basin; Mount Lola and the United States signal station, where a party of men remain all summer, telegraphing by a mirror or solstadt to Mount Diablo; Rock basin and Mount Rose, the latter red with the rare *Eriogonum Torreyaeanum*, and lastly the majestic ruined Castle. Each of these objects deserves a page of description, but space forbids. We generally camp the first night in a little valley under the lee of an immense snow-bank on the eastern brow of Mount Rose. This little dell is carpeted in September with the large flowered, purple *Primula suffrutescens*; the few mossy trees of *Picea amabilis* are cushioned around their bases by dense masses of the super, crimson-flowered, spruce-like heather, *Bryanthus Brewerii*, and close up to the snow is found a little willow in full flower and fruit, yet only one and one-quarter inches high. It is *Salix arctica* and is identical with the dwarf willow growing on the shore of the Arctic ocean. By this you get an idea of your elevation, having ascended through all the climates to that of the Polar seas.

Mount Rose and the Castle are connected by a sharp lava ridge of a mile or more. You can ride half way, then tether your animals to jutting boulders and proceed on foot. On this dizzy wind-swept ridge grow rare and curious plants. There is *Eriogonum Douglasii*, forming a hard globe of tufted leaves; *Gilia congesta*, like a velvet lamp-mat; *Astragalus Hookerianus* with

large purple spotted bladderly pods, and over the ridge trailing from the crevices in the lava hangs the large pink-flowered *Epilobium abcordatum*. Your tracks in the snow fill with blood, seemingly. It is the "red snow" of Arctic highlands and, wonderful to state, is a plant *Protococcus*—meaning the first berry *i. e.*, the smallest fruit; well-named, for it is a simple microscopic cell.

Farther on and away up on a narrow ledge on the vertical east wall of the Castle, the writer once spied a yellow-eyed flower peeping down. Digging steps in the soft rock with his botanical pick, he reached the ledge and secured seven plants of a bright flowered *Ranunculus*. It proved a new species—no wonder; it is named *R. oxyotus*.

Slowly you climb on hands and knees now, to the base of the first turret. There in the splintered lava is a new woolly *Astragalus Austine*, named by request, to honor Mrs. Austin, an excellent lady and careful botanist of Quincy, noted abroad for her observations on the insectivorous *Darlingtonia*.

There are three turrets still standing of the old Castle, each 200 feet high. The first is easily scaled, the second is quite difficult of ascent, and the third, the most eastern turret, shaped like a decanter, has seldom been surmounted. The writer climbed it once by removing his boots and wetting his stockings and gloves with snow, to enable him to cling to the round pebbles, half imbedded in the vertical side. The views from these turrets are among the widest and most interesting of any in California, for the Castle is favorably situated at the side of the Sierra and commands its crests for hundreds of miles each way. An easy traveled ridge, six miles long, connects the castle with Summit station, on the C. P. R. R., and facilitates visitation from that source.

#### Amusements at Webber's.

Beside the ever interesting amusement of rowing and sailing on the lake, availing the oft-repeated echoes with shout and song, or casting the long trolling line for trout, or gliding along shoal-water at night with pine-knot light and impaling spear, there are other amusements of a more exciting sort. The roads are so even and hard, free from dust or stones, that visitors having fine animals are always tempted to let them show their points, and many a dash of speed is made on these fine courses that is worthy of record. Then the hunting has often a spice of danger in it, as when a grizzly, perhaps the famous monster self-named by an injury, "Club-foot," is suddenly stirred up from his lair. A few seasons ago five bears were hunted down here in four days—the wildest, most exciting sport imaginable. The entire population of Webber joined in the pursuit of the last one, several ladies riding fearlessly at the front and assisting to bring Bruin to grief.

But the most common, every-day sport at Webber's, enjoyed even by the invalids, if able to sit up, is trout fishing with rods. For this, you row, or sail at certain seasons, over to the inlet, deeply bordered with willows. Early in the season these willows are filled with mosquitos, but they soon disappear, and it should be noted that, except mosquitos for a few days at the beginning of the season, no insect pests of any kind are known at Webber's. In the deep holes of this inlet, extending like a chain for 100 rods up the stream, is often found the best fishing. No skill is requisite for catching trout when they do bite; a little child often hooking more than adults in the same hour, because of its greater nimbleness in baiting hooks and removing fish. As many as 400 fish have been taken by one boat-party in an hour.

#### Opinions of Visitors.

The *Truckee Republican*, in an editorial, said recently: "No lovelier spot is found in all the Sierra for real enjoyment of families and for the skillful care of the sick than Webber lake. It is accessible from this general depot for tourists at Tahoe, and at the same expense of \$3 for stage fare. Webber's four-horse stage runs regularly between the lake and Truckee, 24 miles, three times a week, from June 1st to November 1st."

The *Downville Messenger* says: "Alternating at will between Campbell's sulphur spring and Webber lake, is about the most delightful occupation we know of in dog days."

The *Sacramento Bee* declares "Webber lake is decidedly the most enjoyable and cheapest pleasure resort in California."

A writer in the *Sacramento Union*: "Webber lake's resources, unlike those of Donner and Tahoe, cannot be exhausted by a visit of a day or two, for it is the exact center of more attractions than can be even enumerated in a long paragraph. Stay one day only at Webber, and perhaps you will pronounce it dull. Stay a week, and you will wish to prolong your visit a month. Stay a month, and you will certainly do as I have done, pass the heated term there season after season."

The *Virginia Enterprise* remarks: "We see several in town who have just returned from the usual summer tour of the Sierra lakes. They have fresh and rare insects, herds in their praise of Webber lake. They declare that while each has peculiar attractions, Webber lake combines more for the same money than any other, besides affording by the presence there of a skillful physician, the good Doctor W., a sure relief for invalids."

#### Distinguished Visitors.

Among the eminent scientists who have lately visited the lake, may be mentioned the California artist, Mr. Hill, who spent a season here transferring the scenery to his canvases; the well-known traveler and microscopist, Dr. Harkness, who has passed two summers here; the eminent entomologist and author, the Russian Baron Von Osten Sacken, who collected many new and rare insects here last fall; and the veteran botanist and tireless explorer, Dr. Parry, with his noble wife, rendering sacred forever the halls and groves of Webber lake.

The Baron writes this winter: "Please present my profound regards to Dr. Webber and Mrs. Anderson, under whose hospitable roof I spent a delightful fortnight."

Dr. Parry writes: "Three bright scenes will ever remain prized memories of our late visit to California. Crater Retreat, near the base of old San Bernardino, Santa Barbara by the sounding sea, and Webber lake up in the Sierra."

#### Routes to Webber Lake.

The best and cheapest route to Webber's for most per-

Continued on page 86.

## MECHANICAL PROGRESS.

## Cold-Punched Nuts.

Our English friends were quite surprised at the American nuts shown at the Centennial and they are free to express their appreciation of our progress in this line of manufacture. A volume of the reports of British Centennial Commissioners has recently been submitted to Parliament, which embraces the following interesting reference to the novelty of cold-punched nuts: "The articles shown consisted chiefly of nuts or other similarly perforated specimens; all were of remarkable beauty, and were given away in great profusion. These nuts had two peculiarities—they were of inordinate depth; and showed clearly that they had been punched cold. Visitors, however, did not hail this new fact in practical science; they said it was an impossibility for a 3-inch punch, however good the quality of steel, to penetrate through 1½ inch of cold iron; that, whatever might be the explanation, a punch of that diameter could not do it without being broken or crippled."

"In time the secret leaked out, for it was no imposture. The makers, in punching, take advantage of the fluid property of solid cold iron or steel, by introducing the element of time into the performance of the operation, giving to the punch only such a load of pressure as it can comfortably sustain, then giving up the reins to nature, when the instrument penetrates at a rate dependent on, and in proportion to, the fluidity of the mass. Hitherto the philosopher and the experimentalist have been writing upon the flow of solids, no one heeding; but here at the Centennial was the natural law made practically available; and, unimportant as it may seem, yet vast issues are bound up therein. The seed there sown in thousands of thinking minds will bring forth many other applications in metal working, and will lead to the performance of many operations that are deemed impossible at the present time."

WHAT IS NEEDED TO DRIVE AN ENGINE.—People are willing to grant the locomotive engineer a good share of courage to stand firm in his perilous position. He also has need of the fine senses. We read an article, written by an engine driver in an English paper, from which we quote as follows: A locomotive foot-plate is the only place in which practical illustrations can be obtained of every way in which it is possible for an engine and engine-man to go wrong. During the time an engine is under steam with a train, everything seen, heard, felt and smelt in connection with it is capable of conveying information to the driver—of teaching him that the secret of successful locomotive driving is close observation, and that no man can on any other terms handle the regulator with confidence. On the foot-plate the eye is taught or trained to distinguish colors at a distance; the ear learns to detect the slightest variation in the beats of the exhaust. Cognizant of a daily deterioration of a piston ring, it learns also to distinguish the difference between a valve and a piston "blow," an axle-box knock from a knock in the journal. The human frame learns to decide what oscillations and pitchings are due to a defective spring and what are due to a defective permanent way; the nose becomes, from experience acquired under all kinds of circumstances, very sensitive, so that it can detect the rising of fire, either in the lagging of the boiler from a spark, or in the axle-box from friction, even before any mischief from mentioning is accomplished. It is under steam and speed combined that the "coral reefs" and "sand banks" on railways can be seen and marked upon the driver's chart. There are upon all lines trap-points, trap-sidings and gulleys put in for the safety of the public, which, if an engine driver is thoroughly acquainted with them, are as surely capable of wrecking an engine as is a hidden rock a stately ship. The rank and value of every locomotive engineer is exactly in proportion to the labor and study he has bestowed on the matter.

KEEPING OUT DUST AND CINDERS.—We read that the Rev. A. LeRoy's simple attachment to railroad coaches, for the purpose of excluding dust and cinders when the windows are open, is now undergoing a test on the Wagner drawing-room cars of the Central road. On a recent trip during a storm it was found that the apparatus excluded rain as well as dust, an outward current from the car keeping all drops from those sitting near the window. The invention is simply a series of slats less than four inches in width attached to the sides of each window. When not in use they are folded compactly against the sash. The slats on the front side of the sashes are let down when the train is running and those in the rear are closed. So perfectly does it do its work, says a New York paper, that a handkerchief held in the lap before an open window will not show a speck of dust or cinders in a ride of many miles.

CLAY TIE.—A railroad tie made of potter's clay is the patented inspiration of Mr. G. W. Chaudler, of Boone, Iowa. The clay seemingly a rather yielding material in its natural state, is to be "burned hard as flint," in sections about a foot in length, which will then be bolted together with iron. The result seems to be the equivalent of stone, although stone sleepers were long ago discarded.

## Weighing the Strength of Wire.

The prosecution of the work on the Brooklyn bridge, is calling out several special devices. One is a testing machine for the strength of the wire, and it is adapted to test up to a tension of 10,000 pounds. It was made by Messrs. Riehle Bros., of Philadelphia. Among the general points of the design, which the *Iron Age* thinks worth noticing, are the keeping the levers in position so as to resist a shock quickly without injury, and with little wear; while very sensitive it is easily and quickly controlled, whether operated by steam or hand. A specimen can be tested without cutting it from the coil, and the length of the test piece may be one foot or five according as a long or short piece is needed.

No preparation is needed to hold the wire, as it is introduced at once directly to the center of the vises and held firmly without screw or application of the hammer. Tests can in this way be made with great rapidity and accuracy. The pulleys over which the belts run to main shaft are composed of one loose and two tight ones, which permit the working of the screw backward and forward by merely shifting the belt, which can be readily done by the operator at pleasure, while making the test. The hand-power is applied by means of a ratchet, which also works both ways.

The beams are double, and are provided with gravitating poises. There are two grooved wheels, both behind the center on the inside of the poises, which have the tendency of throwing the knife edges into the notches and holding them there; this is preferable to the spring arrangement. The whole machine is constructed of metal. The screw is made of steel, the beams of red brass, and all the steel fulcrums and bearings are made true and even.

STEAM CARS ON CITY STREETS.—John D. Imboden has perfected a system that is said to work well; we append a description taken from the Philadelphia Times: The engine is an independent sub-motor—a complete machine in itself, and can be attached to any of the present horse cars. It is simple, easily handled, cheap, and, better than all, causes no discomfort to passengers, it being out of their sight, smell and hearing. It has its own frame work, wheels and springs, carries its coal, water and engine, and sustains half the weight of the car and passengers, the other half being carried by a single pair of car wheels, just in front of the rear platform. The car body is pivoted at its front end, on the engine, resting on the bed plate and springs over the boiler. The engine has four driving wheels, with a wheel base of only four feet, and, owing to the simple pivoted connection with the car body, it is capable of curving freely. The boiler is horizontal, with a vertical furnace and steam dome under the driver's seat, which is outside the front of the car. The "test" car has been made the same size as that of an ordinary horse car, so as to demonstrate thoroughly that in order to convert the latter into a locomotive nothing is necessary but to take off its front wheels, put this handy little engine in their place and nail up the front door. The interior and the rest of the car can be left intact. The new car occupies four feet less street space than one of the dummies now in use on Market street, and ten feet less than the horses, they being dispensed with.

PROGRESS OF STREET RAILWAYS.—Mr. John Stephenson, the widely-known street-car builder, gives the following sketch of the early history of street railways in this country: "The Fourth Avenue (Harlem) railway was chartered as a city road in 1831; the first section opened in 1832. Steam, as a motive power for street cars, was used in Fourth avenue, in New York city, as early as 1835, and has continued to be used on that avenue. There were no tramways outside of New York until after 1855. Nor did Philadelphia have a tramway proper until about 1857, at which time tramways were also introduced into Boston. Tramways did not exist outside of the United States until 1860. George Francis Train then commenced such construction in Birkenhead, England, but no other road was made in that kingdom till 1869, and now the chief cities of Europe are enjoying this American luxury. In fact, it is an element of modern civilization adopted in Asia (Bombay and Java) in 1868, South America in 1866 (Rio de Janeiro in 1866 and Buenos Ayres in 1869, and now in every city of importance). Australia is about opening its first tramway, now nearly ready, in the city of Adelaide."

GOOD FOR THE FUTURE.—The American Manufacturer says: At no time has so much attention been given to the rearing of young men for fitness in special branches of trade. Our scientific institutions are furnishing us with young men of excellent technical education, who enter their profession with a valuable stock of knowledge, which enables them to at once become useful and indispensable aids in the prosecution of our great industrial enterprises.

AIR FOR ARMOR PLATING.—Recent experiments at Woolwich have proved that hy far the most efficient protection against chilled iron shot is a thick slice of air inclosed between two comparatively thin armor plates. Thus a four-inch armor plate, placed rather more than four feet in front of a 10-inch plate, was found to have so disintegrated an 800-pound projectile that the hinder plate was hardly bent and had a large dab of metal sticking to it.

## SCIENTIFIC PROGRESS.

## Oligochæta.

At the last meeting of the S. F. Microscopical Society, Dr. Gustaf Eisen, Professor of Zoology, Upsala, Sweden, a corresponding member, called attention to some minute worms of the *Oligochæta* of the family *Tabijicæ*, and exhibited some fine plates of beautiful drawings made by his skillful hand, representing their anatomy. The worms were all found in California, near San Francisco, in the Sierra Nevada, or in the redwood forests along the northern coast, all inhabiting ponds, lakes or even clear-running streams. Of said family, only five genera are known, viz: *Tabifex*, *Psamoryctes*, *Preatotrix*, *Limnodrilus*, and *Thelmatodrilus*. Of those, all except *Preatotrix* were found in California, and one, the *Thelmatodrilus*, was endemic to the waters of the higher Sierra Nevada. The Doctor called attention to some points in their anatomy, and pointed out some characters by which species and genera could easily be distinguished, as in the *Oligochæta* generally no external characters are found and the species must be arranged according to the shape of the interior organs. As a genus characteristic, the suprapharyngeal ganglion is of great value, but as to species characters the generative organs were undoubtedly the best. The organs represented on the drawings were principally the nervous system, the ovaries, the testes, the efferent ducts and the segmental organs, all exhibiting characteristic forms in the different species. The species described were *Limnodrilus crinis medusæ*, *Limnodrilus vejdoerkyi*, *Limnodrilus corallinus*, *Tabifex marbilis*, *Thelmatodrilus alpestris*, and *Psamoryctes Californicus*. Besides these many forms had lately been found, but many more yet were likely to occur in our stagnant ponds or rivers. The Doctor expressed his hope that the members of the society, during their excursions, would capture and preserve all such worms found, and any contributions, however small, should be most thankfully appreciated. Nearly every large body of water contains one or several new forms, and a perfect collection could only be brought up by a diligent search in different parts of the country.

ARE COPPER SALTS POISONOUS?—This is a question commonly supposed to be settled in the affirmative, but a discussion upon it seems to be going on abroad. The *Journal of Chemistry* notes that in a recent communication to the French Academy of Sciences, M. Galippe points out that although the various compounds of copper give rise to a severe vomiting when administered in large doses, the same compounds may be taken for long periods of time in smaller doses, progressively increased, without the occurrence of any unpleasant symptoms. Burg and Ducom fed dogs every day during two months on food which had been cooked and allowed to cool in copper vessels previously exposed to the action of vinegar and salt, without producing any poisonous effects. Galippe himself, for more than a month, lived on food cooked with or without vinegar in untinned copper saucepans, whose contents were often allowed to remain for 24 hours in contact with the metal before they were put on the table. The various dishes thus prepared, though often coated at their edges with the greenish matter commonly termed verdigris, were partaken of, both by himself and by other members of his family, without giving rise to any dangerous or even disagreeable symptoms.

STATUES TO SCIENTIFIC MEN.—An unusual interest is manifested in France at the present in regard to honoring her distinguished men of science by erecting statues to their memory. A statue to Arago is being erected at Perpignan, in the department of Orientales Pyrenees. Another to Nicéphore Niepce, a name well known in connection with improvements in photography, will be erected at Chalons-sur-Saône, his native place, by public subscription, at the instance of the Municipal Council of the city. It is also stated that a public subscription will be opened at Lyons on behalf of Ampere, the inventor of the electro-magnet, and the precursor of Faraday in the invention of the inductive electricity. Ampere was born in that city in 1775, and his father was guillotined there on the Place des Terreaux for having been active in the great royalist rebellion against the Convention, which ended in the famous siege of Lyons and his capture by Dubois-Crance.

SANDSTORM IN ROME.—On June 22d a curious shower of sand and mud, coming from the south, fell in Rome, which seems to be regarded as due to sand brought in a dust-storm from the great desert in Africa, being mixed with the pollen of some vegetable, and held in solution by the cloud which carried it. An artist, writing to the *Times*, says that yellow spots, of about a twentieth of an inch in diameter, were made on the paper on which he was sketching, and also—though the color varied from yellow to white—fine drops of the same diameter fell all about the neighborhood of Rome. The cloud which brought it, though giving out little or no rain, turned the sun at 4 P. M. into the semblance of "a pale moon of greenish tint." Similar phenomena were no doubt mistaken for a rain of blood by the Romans, and regarded as prodigies, ominous of coming evil.

## Columbium.

Mr. J. L. Smith, of Louisville, says *Nature*, has examined several species of mineral containing columbium, and claims the restoration of this name for the metal instead of that of niobium, generally given to it in England and on the Continent. His reason for making this reclamation is that the name niobie acid was incorrectly given by H. Rose to one of the acids found by him in his researches on the columbite of Bodenmais, and subsequently proved by him to be identical with the columbic acid originally discovered by Hatchett in 1801. The name niobie acid, however, given by Rose, has never been altered, and Mr. Smith thinks the original columbic acid should have been retained. In remarks on the chemical constitution of the minerals described by him, Mr. Smith thinks that the composition of the columbates, although appearing at first sight complex and irregular, becomes much simpler when due allowance is made for the intermixture of the different varieties with each other. Columbite, the best known of the minerals, can be well recognized as a simple columbate of iron and manganese; microlite appears to be a columbate of lime; pyrochlore, a columbate of the cerium oxides and lime, but whether or not a neutral columbate remains to be investigated. Hatchettite he considers as a neutral columbate of niobium and lime, and samarskite a basic columbate of iron, niobium and yttrium oxides. Yttracolumbite and euxenite are basic columbates of yttrium and niobium, the first being anhydrous when pure, the second containing water. Fergussonite is a hydrated basic columbate of yttria, and rogersite a columbate still more basic. In arranging a general view of these minerals, Mr. Smith does not take into account the constituents which exist in small quantities only.

THE COSSACKS AND SCIENCE.—An English writer shows how the Cossacks may apply science in the present war, as follows: "In a belt around their waists they carry a few pounds of gun cotton or dynamite, and with this highly destructive explosive they may work incalculable harm. A small charge of gun cotton placed simply upon rails and fired with a fuse suffices to blow several feet of the iron to a distance of many yards, thus rendering the railway unserviceable on the instant. A trooper may dismount, place a charge at the base of a telegraph pole, fire it, and be in his saddle again within 60 seconds. Wires may thus be cut and communication stopped in the heart of an enemy's country by fearless riders, while the lines of railway are entirely at their mercy. Even light bridges and well built stockades may be thrown down by the violent detonation of compressed gun cotton, and forest roads considerably obstructed by trees thrown across, which are never so rapidly felled as when a small charge of this explosive is fired at their roots."

MAKING SPEECH VISIBLE.—At a meeting held at Salem, Mass., a lecture on "Visible Speech" was delivered by Prof. Graham Bell, who, by means of the drum in a human ear cut from a dead subject, has succeeded in producing a phonograph. The ear is placed in the end of an ordinary speaking trumpet; on speaking into the trumpet the drum is set in motion; this moves the style; the style traces the effect on a plate of smoked glass; and by means of a camera the curves and lines can be exhibited to a large number of spectators. The five vowels make five different curves; and, according to Mr. Bell, there is no such thing as a sound or tone pure and simple, but each is a composite of a number of tones; and the wavelets by which these are produced can also be shown on a screen. Tables of the various symbols have been drawn up, and found useful for educational purposes, as was demonstrated by a young deaf and dumb pupil from the Boston institution, who interpreted the symbols at sight.

AGE OF SUN AND STARS.—Prof. Kirkwood closes a communication upon this subject to the American Philosophical Society with the following summary of his conclusions: 1. The history of the solar system is comprised within twenty or thirty millions of years. 2. From the fact that the larger component of Alpha Centauri radiates twice as much light as the sun, while the mass of the former is less than that of the latter, we infer the probability that our solar system is the more advanced in its physical history. 3. 61 Cygni seems to have reached a greater degree of condensation than the sun, since, on the hypothesis of equal destiny, the surface of the larger member is one-third that of the sun, while the intrinsic light is less than one-ninth. 4. The companion of Sirius appears to have reached a stage of greater maturity than the sun, while the contrary seems to be true in regard to the principal star.

NEW SPONGES.—No less than five new varieties of sponges were discovered by Dr. Meyer, at the Philippine Islands and New Guinea, during his recent travels in the Eastern archipelago.

COMING.—Two French astronomers, M. Andre and M. Angot, will visit California, next year, to observe the transit of Mercury, which occurs on May 6th.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

## AMADOR.

**LIVE OAK.**—Amador Ledger, July 4: The workmen are taking out a fair quality of ore from this mine. The ledge is increasing in size as the drift advances. Operations are being pushed along steadily, and the owners are strong in the belief that they have a good paying property.

**FROM SETTER CREEK.**—Mr. John Tucker, an old resident of this vicinity, has been prospecting for gold in the hill back of the Mahoney mine, for some time. Last Saturday he struck a very rich vein—to every appearance a "pay streak." A specimen of quartz about the size of a cobble stone was thickly covered with gold. The shaft is down 50 feet and the vein is from five to six feet thick. The indications are good that it will hold out. Messrs. Tibbitts & Tucker are the owners.

**RIEN ROCK.**—Amador Dispatch, July 4: The water has just been turned out of the mine, and the surface is a rich rock, and remarkably rich rock discovered in the 800-ft level. The ledge is about six feet thick, and it is thought that the rock will average \$50 per ton. The owners are enjoying the highest state of jubilation.

## BUTTE.

**GOLD BRICK.**—Oroville Mercury, Aug. 5: Elsewhere in this issue we give an item referring to the fact that the Spring Valley Co. brought down an \$18,000 bar of gold. On Wednesday of this week, we saw on the counter of Lideout, South & Co.'s bank, a splendid looking bar that has since been taken out, that was worth \$33,000, making \$51,000 that has been cleaned up inside of a week. We hear the end is not yet.

**SECTION MACHINE.**—While at Oroville on Saturday, we took a look at the great suction machine, then at work immediately above the bridge which spans Feather river. As we were not permitted to go aboard the boat that contained the machine, we cannot give our readers a very accurate description of its workings. This we may say with truth, though quite of its character, is a very wonderful piece of mechanism and performs its work well. A company of Oroville gentlemen are constructing a machine on the same principle as the one now in operation, for the purpose of working the bed of Feather river just above the dam of the old Cape claims that paid so enormously twenty years ago. The new machine will be five times as large as the one now at work, and will be worked with an engine of forty-horse power.

## CALAVERAS.

**GRAVEL MINE SALE.**—Stockton Independent, Aug. 4: Two Italian miners, who owned a gravel claim called the Garibaldi, three miles north of Alta Vista, Calaveras county, recently sold out for \$40,000, and with their families left for their native land, where they will reside in affluence the balance of their days. We happened to be on the stage that brought them from Alta Vista to Milton. They were of the lower class of peasantry, without refinement or education, and fully calculated to enjoy the luxuries which such fortune and it is possible for them to possess. We could not but wonder at the freaks of the fickle goddess in the bestowal of her gifts.

**UPPER COUNTRY FRESNO.**—Calaveras Chronicle, Aug. 4: At West Point, mining operations are being carried forward with usual briskness. At the Champion, both sinking and stopping are being vigorously pushed. The shaft has reached a depth of about 340 feet, the ledge showing as well as at any other place. In fact, the Champion is sustaining its well earned reputation of being the "boss" mine of the upper country. The Hall or Zaccaro mine is now running on rock from the Doyle mine. The Zaccaro is being constantly worked with cheering results. The tunnel in the Lacey mine is completed, and the work of taking out ore is to be commenced immediately. New and powerful works are being erected at the Lacey mine, the property of the Enterprise consolidated company. The mine is looking splendidly. At Railroad, the Chapman mine is being systematically worked. The new pump lately put in the shaft keeps the mine free of water, and operations are going ahead briskly. A fine ore body has been uncovered in the levels. The work of re-erecting the hoisting works on the Sander mine, lately destroyed by fire, has been commenced. At Mequito, mining affairs have suddenly taken an impetus. Work has recently been resumed on the well-known San Bruno mine, and operations have also been recommenced at the Vance. Both mines are now in the hands of a substantial company. In the Potter & Rodgers mine a 7-foot vein of fine ore has been developed. Work is progressing favorably at all points.

## EL DORADO.

**COMPLETED.**—El Dorado Republican: Warren Bros. & Co., on their river claim above Chili Bar bridge, have completed their dam and flume, and the water has been running through the flume all the week, and they have probably commenced sinking to the bottom of the channel here. The break in the big ditch last week caused the river to rise to such an extent as to test their flume to its fullest capacity. There are now several Chinese camps in their vicinity using the rocker.

A SLATE quarry has been opened near Kelsey, and the first load of the product was brought to this city yesterday, in the shape of a fair article of roofing slate. It is not as smooth as we have seen, but is exceedingly tough.

**CHURCH-UNION.**—Cor. Mountain Democrat: The mines in this vicinity are all paying well, and are being worked by able and moneyed men. The Church-Union mine, a short distance from town, under the superintendency of Mr. Poundstone, is paying very well. The rock taken out in the last 12 days run yielded \$25 to the ton. Water being scarce, the Superintendent was unable to procure enough to run both the hoisting works and the mill, consequently the latter has been shut down for a few days; but work will soon be resumed, preparing to run the hoisting works by steam. The mine gives employment to about 40 men.

Work at the well-known Pocahontas has been resumed. Last week they struck a ledge of good paying ore, which it is to be hoped will hold out.

The Cook mine is also paying well. It is being worked by a force of men under Capt. Staples.

The Star mine, owned by the Condo Bros., is being worked with great success. Last week was taken out quite a quantity of very rich ore. \$1,000 was pounded out of the rock in a mortar, besides 60 tons of rock said to be worth \$50 a ton.

A NEWLY discovered mine, about three miles southeast of town, is creating considerable excitement among mining men. One hundred tons of rock have been taken out, which was found to be very rich. The mine is worked by Harding & Gignac. There is considerable talk of putting up a mill on the ground.

**INVO.**

**THE CROOKS.**—Inyo Independent, Aug. 4: The Rex Montis brought down four bars of fine bullion to-day, but it is understood that future operations may be retarded for a time on account of a dispute regarding the mill property. The production at the Eclipse was fully as large as anticipated; in fact, the run just completed was by far the best ever made in the mill, but we are not in possession of the exact figures.

**ACORN BAR OR BURR.**—Coso Mining News, Aug. 4: Peter Taylor, Superintendent of the Emigrant mines at Lee district, came in last Saturday, bringing with him another bar of silver bullion from the above company's mines, weighing 33 pounds, which he shipped to San Francisco. Mr. Taylor says that his bullion contains only a percentage of gold, making the bullion much more valuable. Everything in and about the mines and mill is working finely. Since the foregoing was put in type, another bar of Emigrant bullion was sent in from their mill, weighing 70 pounds, and shipped yesterday.

**MARIETTA BULLION.**—W. E. Brown, Superintendent of the Marietta company's mine, at Lookout, came in the fore part of the week, bringing with him, for shipment to San Francisco, four bars of bullion, weighing 332 pounds.

## NEVADA.

**BEAUFORT BAR OF GOLD.**—Nevada Transcript, Aug. 4: We saw yesterday a beautiful bar of gold, which came from the Independence mine, formerly known as the Murchie quartz ledge. The gold weighed 23½ ounces, and was valued at \$375, which was an average of \$75 per ton. This is exclusive of the sulphurets, which are very rich. The ledge at the Independence mine is increasing in thickness, and yet holds its own as regards richness. The owners feel considerably elated at the result of this last week's work, and the work of opening up the mine on a more extensive scale will be the result. The Independence promises to make a steady paying quartz mine.

**COPPER MINES.**—The copper mines at Spenceville, and its vicinity, are beginning to look up again. One ledge there is about 120 feet wide, and is now being worked under the superintendency of G. E. Dietkin. A gentleman who was down there a few days ago, informs us that he witnessed some of the ore being put through by a machine he had never seen before. He describes it as follows: The ore is placed in large piles and is set on fire, and there is sufficient sulphur in the ore to keep the fire alive. After it has been thoroughly burned the fire is extinguished by means of a hose, and all the debris is washed off. After the debris is washed off, it is placed in revolving pans, and in the pans there are large pieces of iron like the ones which most of the sulphur that has remained in the ore. After going through this process, it is shipped to San Francisco. The cost of getting it out is \$1.25 per ton, and about \$4 to land it in San Francisco. Several lots which the company have shipped paid about \$20 per ton.

**STILL PASSING OUT.**—Wm. Watt, Superintendent of the Eureka mine, yesterday shipped \$14,500 to San Francisco, the result of the Eureka's clean-up for the past week or ten days. The "old Ajax" has performed wonders in the way of bullion.

**GRASS VALLEY NEW M. Co.**—Grass Valley Union, Aug. 4: The mine owned by this company is looking well. The ledge in shaft is about three feet in thickness and contains heavy sulphurets in abundance, while free gold is visible. The ore is very much like that of the Eureka and Idaho mines, and many think the Grass Valley New is on the regular Eureka ledge. The New is nearly directly west of the Eureka, and the ledge runs east and west. The name of "Ginlet," which the miners facetiously bestowed on the Grass Valley New mine, will have to be changed, for the present appearance argues well for big and rich ledge. The stock of the company is owned in Grass Valley, and the stockholders are nearly all working miners.

**DISCOVERY OF CINNABAR.**—W. G. Schofield, who is an experienced miner, has discovered a cinnabar ledge, about seven miles from Grass Valley, in the direction of Colfax. The ledge is reported to be from 75 to 80 feet in thickness, and Mr. Schofield thinks it will give 25% of quicksilver. He went to San Francisco yesterday morning, where he will order a furnace. In the course of a month or six weeks the furnace will be in operation. Mr. Schofield will be able, he thinks, to sell Nevada county quicksilver to the miners here at San Francisco prices, thus saving freights. In a few weeks we will know more about the matter and will then give more particulars.

**OAKLAND.**—Foothill Tidings, Aug. 4: The Oakland company, whose mine is on Wolf creek, near the Home-ward Bound, has its wheel and building well under way, and expects to be hoisting and pumping by machinery in about 10 days. We understand the prospects of the company are good.

## PLACER.

**A SUCCESS.**—Placer Herald, Aug. 4: We spoke a few weeks ago of the Verry Bros. opening a quartz ledge a short distance this side of the Greene mine. Further developments go to show that they have a good mine. They have now some 60 tons of milling ore on the dump, which is worth about \$40 a ton, a yield that is very good in any country.

**J. R. ROBINSON.** Superintendent of the Gold Bar mine, located on the American river, a few miles above Auburn, informs us that they are now down to the gravel and that their prospects are altogether encouraging. This company are going under the river channel for the treasures that lie beneath, and the prospects are that their enterprise will prove a fine success.

**IOWA HILL TREASURES.**—Placer Argus, Aug. 4: Mr. Witherspoon has bought Streeter's interest in the Centennial company's claim. The prospects in the canyon below are considered good. It has not been worked for the past eight months. At the Chimney Rock claim, at Green valley, a mine 340 feet long, besides bull-wheels, pumps, and quicksilver, has been discovered. The works are very fine. A pit, 60 feet long and 40 feet wide, has been dug down 12 feet. In eight feet more they expect to strike the bedrock and take out good pay. C. H. Wilcox is foreman. There are only 12 men employed as yet. At Joe Norry's claim, also in Green valley, a tunnel has been run in 250 feet, and a channel struck that pays about \$3 per day. Last week a few \$12 chunks were taken out. Norry has a three-stamp mill and crusher of his own. Williams has opened an old claim and expects to be rewarded for his labor. George Opal has run a deep cut of 15 feet about 160 feet into the main channel. Joe Ross, on Hayden hill, is running cuts, preparing for winter. The Rough and Ready claim, on Grizzly Flat, has been bought by the owners of the Hidden Treasure, who propose to work in the tunnel. They are going to put on an engine and sink a slope. It was surveyed last week.

## TRINITY.

**FROM NEW RIVER.**—Trinity Journal, Aug. 4: Moses Patterson came into town Tuesday from the New River country. He reports a large number of men in this section at the present time, and prospecting going on lively. New diggings, with coarse gold, have been struck in the Devil's canyon, by Bowler, Jewett and "The Chicken," from which pieces weighing as high as \$16 have been taken. Patterson went over to pay out a piece or two to bring into town as a sample, but did not find any "chipsas," though he found a few large ones.

**BULLYCHOPE.** Mr. Gupill informs us that the Bullychope ledge is turning out well as the miners progress downward. They have now a well-defined ledge of paying quartz, four feet in thickness.

**SUIT DOWN.**—Hon. W. J. Timin returned this week from Cinnabar, where he has been superintending the work done by the Trinity Q. M. Co. From Mr. Timin we learn that there is little done in the Cinnabar mines at the present time. The water has run very low, putting a stop to sluicing operations, and when the Altona finishes cleaning up its present run it will probably shut down work and employ but few hands.

**MORE QUARTZ.**—N. M. Barnett has discovered another quartz ledge, which prospects well. The new discovery will make the mine a large one, and the ledge is about a mile distant from that place. The existence of such a ledge has been surmised for some time, and parties have prospected considerably for it.

**GOOD PAY.**—Geo. E. Sargent is one of the lucky discoverers on Deadwood, and his ledge is yielding something like \$100 per ton. He returns. He crushes some of the rock in a large mortar, and the result of 12 days' work averaged \$38.38 per day.

**RICH QUARTZ.**—A splendid prospect was obtained by Mr. Paulsen from a piece of Deadwood quartz. The piece did not show any free gold, but when pounded up yielded very richly. Another piece from H. E. Willey's claim exhibited a fine showing of gold, and the naked eye, excellent. One of the owners, John Shedd, says that the Poor Man's quartz mill, consigned to Henry Jenkins, and intended for use in crushing the quartz from the Engel ledge, on East Fork. The mill has two stamps and is calculated to run by hand or water power. The mill was set up this morning and is being tested.

**A GOOD PROSPECT.**—Two rollers showed us a fine lot of gold obtained from Deadwood quartz. The weight of the rock pounded up was nine ounces, part taken from H. E. Willey's ledge and part from another ledge. The

nine ounces of rock yielded \$1.50 in gold, or over 16 cents per ounce.

## Nevada.

## WASHOE DISTRICT.

**SIERRA NEVADA.**—Gold Hill News, Aug. 8: The north drift on the 1250-ft level, running to connect with the Utah, is making good progress, the face still in very favorable ground. It will probably take 90 days yet to complete the connection. The south drift on the 1450-ft level is also being pushed rapidly forward to connect with a corresponding north drift from the Mexican. This connection will probably be completed inside of 60 days.

**UNION CO.**—The north and east drifts on the 1300-ft level are each being steadily and energetically advanced without change of interest to report. Wm. Hardy, the present able Superintendent of the Imperial Co. mine, received, yesterday, his appointment as Superintendent, vice Capt. Samuel T. Curtis, removed; and W. A. Longene as foreman. Both gentlemen are well versed in mining operations, and there is no longer a doubt of the honest management and development of the mine.

**GOLD & CURRY.**—Sinking the main incline is making the usual fair progress, the rock in the bottom being still of a hard blasting nature. The main east cross-cut (No. 1) on the 1750-ft level has been started up and is making good progress. Cross-cut No. 2, from the south drift on the same level, is also being pushed steadily and vigorously forward, the face in very favorable vein matter.

**MEXICAN.**—The north drift on the 1405-ft level, running to connect with the Sierra Nevada mine, is being pushed energetically ahead, the face in very favorable ground. The north drift on the 1600-ft level shows no change.

**OVERMAN.**—An east cross-cut has been started on the 1150-ft level, about 550 feet south of the shaft, the face of which is in the favorable character of quartz. The south drift on the 1300-ft level is being pushed vigorously forward, with highly encouraging prospects.

**BELLION.**—Work on the 1000 and 1700-ft levels, and in sinking the main incline, has been suspended for a few days in order to retimber and repair a portion of the main shaft that has been needing it very much for some time.

**COX VIRGINIA.**—Daily yield, 500 tons of ore, keeping the mills all crushing to their full capacities. The bullion production for the month of July will reach something over \$1,000,000. The regular dividend of \$2 per share was declared yesterday, aggregating \$1,000,000. The ore-producing slopes from the 1650 up to the 1400-ft level are looking well and yielding good ore at every point.

**GOLD & CURRY.** The ore slopes south, on the 1300-ft level, are also being opened up preparatory to the rapid extraction of ore when the repairs to the main shaft are completed. The upraise from the 1500 to the 1400-ft level has been completed, having passed the entire distance upward through splendid ore. The double winze below the 1650-ft level is being sunk at a fair rate of speed, the bottom still in ore. The water in the winze is gradually lessening. The west drift on the 1750-ft level from the C. & C. shaft is making splendid progress, advancing at the rate of 50 feet per week.

**CALIFORNIA.**—Daily yield, 550 tons of ore. The ore slopes are splendidly developed portions of the mine. The mills are all running at their full capacity, and the future prospects of dividends for long months to come were never more glowing than now. The regular monthly dividend of \$1,050,000 was declared yesterday, and the yield of bullion for the month of July will not fall much short of \$1,500,000. The winze recently started in the ore body 20 feet north and 20 feet west of winze No. 8 is being pushed steadily forward, toward the 1600-ft level, in the richest character of ore. The ore body going south, between winze No. 5 and winze No. 6 on the 1600-ft level, is growing wider and is still of the same rich quality. Repairing the deep winze near the northern boundary line is going steadily ahead. The south drift on the 1840-ft level is steadily advancing in the west country rock. To-day a branch drift from the west drift on the C. & C. shaft, on the 1750-ft level, was started to run in a westerly course so as to intercept and connect with winze No. 3 below the 1650-ft level.

**YELLOW JACKET.**—At the 2300-ft level a prospect hole is being bored east from the main south drift, opposite the west cross-cut. It is in a distance of 240 feet, and over half that distance has been bored in quartz which is well filled with iron sulphurets, giving low assays in gold, but silver value is the only thing done on this level for the past five days, but drifting is to be resumed to-morrow, north and south. The heavy masonry foundations for the hoisting engines are completed, and the machinery is being brought down from the side-track and placed in working position as fast as its ponderous nature will admit.

**JUSTICE.**—Daily yield, 300 to 350 tons of ore. The decrease in the yield of ore is entirely owing to the Carson river mills being unable to crush the usual amount of ore on account of the very low stage of water. The ore slopes on all the levels, from the 500 down to the 800-ft level, are looking finely and have a large amount of ore yet in sight ready for extraction. The main east drift on the 1150-ft level is being steadily advanced, the face in soft porphyry mixed with streaks of clay and quartz.

**LADY BRAX.**—Four car loads of the hoisting machinery have arrived at the railroad depot in Virginia, and is being shipped to the mine as rapidly as it can be loaded on the wagons. It will be remembered that at the time the mine was closed down a month or two since, the new and powerful pumping machinery was all in place, just ready for use, and the hoisting machinery was all in place, just ready and inclosed; that the gallow's frame was up, and, in fact, everything in and about the mine was, after a long struggle, just approaching a condition paramount with the real intrinsic merits of the mine. The financial troubles of the company have all been settled, and they will, in a very short time, be in a splendid condition to commence work.

**OMIR.**—Both the north and south drifts on the 1000-ft level are making the best progress. The east drift from the bottom of the shaft, on the 1700-ft level, is making fair headway, with some favorable ore prospects. Sinking the double winze on the Mexican line below the 1700-ft level is making fair headway. Wm. Hardy, the temporary Superintendent, yesterday received his appointment as the permanent Superintendent, and telegraphed his acceptance of the same.

**DEER & BELCHER.** East cross-cut No. 3 on the 1700-ft level is making steady progress, the face in soft porphyry, with a continued and heavy flow of water.

**SAVAGE.**—The small donkey pumps used to supply the larger pumps and drain the water at the bottom, having given out, are being replaced with a splendid Cameron pump of the largest size. This will be ready for operation in a day or two more. A Root blower has been placed on the 1600-ft level to supply air to the men at work in the shaft.

**IMPERIAL CO.**—Sinking the south winze below the 2200-ft level is going steadily ahead, the streaks of quartz in the bottom continuing of a fair character.

**UTAH.**—Sinking the main incline shaft below the 1150-ft level is making the best progress, the bottom still in very favorable ground. The north drift from the Mexican, at the east drift at the 1150-ft station has just been started.

**HALE & NORCROSS.**—The pumps are kept steadily running at the top of their speed, and have gradually reduced the water to a point a few feet below the 1000-ft level.

**LEVIATHAN.**—The north cross-cut at the 600-ft level is making good headway, and the whole face at present is in containing several fine streaks of high-grade ore.

**BELCHER.**—Sinking the air and drain shaft is going steadily forward without change or interruption.

**CALEDONIA.**—The northwest drift on the 1600-ft level has been cutting some very fine quartz, with every indication of an ore body, not far below for several days past. However, sinking the main shaft is making the best of progress, the entire bottom being in vein matter that is steadily improving in character as a greater depth

is attained. The formation in the bottom for the past two days has been clay and decomposed quartz mixed with gypsum, and is easily worked.

**SUCOR.**—Sinking the main shaft is being pushed ahead with all the energy possible, the bottom being in very hard blasting rock.

**CUILLAR-PORTER.** Daily yield, 90 tons of ore. The east drift on the 1750-ft level is being pushed ahead with the usual vigor.

**ALTA.**—The west drift from the 1050-ft station is steadily advancing, the rock in the face gradually softening and showing evident signs of a near approach to the level.

**CROWN POINT.** The south drift on the 2000-ft level, running to connect with the Belcher air and drain shaft, is making steady progress.

**SUBTUNNEL.** Total length of tunnel, 17,715 feet. During the past week the rock encountered has been very hard, but has worked advantageously, allowing of unusually good progress.

**SILVER HILL.** The new pump-hoist is finished and on its way from San Francisco.

## CHERRY CREEK DISTRICT.

**NEW MILL.**—White Pine News, Aug. 5: John Howell, an old-time millman of Eastern Nevada, and particularly identified with Austin ore in years past, is to have charge of the erection and management of the Star company's mill about to be constructed at Cherry Creek in this county. The mill is to be built under contract by the Pacific Iron Works of San Francisco. New hoisting works are already on the ground and in course of construction. Chas. Keeney, the former Superintendent, is now in charge again. Cherry Creek has put on a look of business again.

## ELY DISTRICT.

**RAYMOND & ELY.**—Pioche Record, Aug. 4: The ore bodies in the upper levels are looking much better than usual and are yielding well, with a better character of ore. The ledge on the 1200-ft level remains about the same, no change of note having occurred since our last report. The mill is still running on tailings; ore being allowed to accumulate on the dump, about 300 tons now being on hand. Pay-day for both the mine and mill will be on Monday next, the 6th inst.

**ALPS M. Co.**—The Chicago mill has been running constantly on ore during the past week. The prospect in the mines is even better than at last report. The Superintendent reports that the development in the winze on the 900-ft level of the Mazappa mine, referred to last week, is improving. A fine vein of free milling ore has been discovered in the upraise from the 4th level of the Washington Creole mine.

**BELLEVILLE FURNACE.** The furnace at Bullionville closed down on the 1st inst., after a two weeks' run. It will be about a week yet before it starts again. Want of coal was the cause of stopping.

**RESIGNED.**—A. J. Blair, Superintendent of the Alps M. Co., has been obliged to resign the position on account of ill health. Theodore Hale has been appointed Superintendent, and took charge Monday last.

## MARIETTA DISTRICT.

**ENDOWMENT.**—Gold Hill News, Aug. 6: The Endowment mine, which is situated in Marietta district, about 10 miles from Belleville, is owned by Dr. Webber and others of Virginia City. Ascertaining its actual value, they secured possession by purchase, and went to work to practically develop their new source of wealth. Since the incorporation of the mine in May they have started a five-stamp mill to crushing the ore, with most gratifying success, the first seven days' run yielding bullion to the value of \$5,000. The yield for the past month exceeded \$15,000, and double that is expected this present month. The mill has five stamps and two Stewarts pans, being the same neat little mill that represented the State of Nevada at the great Centennial exposition. The shaft is down 180 feet, and the vein is about three and one-half feet wide. The ore averages about \$100 to the ton. Regular bullion shipments are coming from the mine by the way of Carson.

## TYBO DISTRICT.

**CLOSED DOWN.**—Pioche Record, Aug. 4: About a dozen persons arrived in Pioche from Tybo on Tuesday last, and more will leave there shortly for other points. Owing to the fact that the company having charge of the Tybo mine was obliged to close down except one; that one is running, but will not continue to run long. This places business for the present at Tybo at a standstill, and there is no telling when the furnaces will start again.

## WHITE PINE DISTRICT.

**TO RESUME OPERATIONS.**—White Pine News, Aug. 4: The Henry tunnel (designed to pierce Treasure Hill) upon which work has been suspended for several months, is to resume operations immediately. Mr. Montgomery, the well-known mechanic, has received orders from the East to put the machinery in working order, preparatory to starting up at once. We are not able to state positively whether Major Henry is to be the Superintendent or not.

## Arizona.

**LUKE'S MILL.**—Arizona Miner, July 27: The owners of Luke's mill, in Bradshaw, after testing their mill and finding it complete in everything except a roaster, have sent Mr. Donahue, having seen the mill in San Francisco and order it. The ore contains sulphurets, and cannot be worked successfully without first being roasted. Therefore they have concluded to add this necessary article before starting in for good; in the meantime ore will be taken out and other improvements made just the same as if the mill were running. Water is also scarce and rain necessary to furnish sufficient for mill purposes. The two-stamp mill has been purchased for the Pima mines. They are cheap, and every mine owner should possess one of these little mills, whereby they might be able to develop their valuable mines, and thus line their pockets with the needful.

**MR. DARROCHE** has been on a flying trip to the Peck, Humburg and Bradshaw districts, and reports very favorable for the mines. He informs us that the Peck, Bradshaw, McFee and Gillespie have struck a very rich lead in Humburg district, that assays into the thousands per ton.

**THE TIGER TO BE WORKED.**—We were shown a telegram this morning from J. H. Helm, who has bonded the Tiger mine for six months. Mr. Helm is in San Francisco, and telegraphs Bowers & Richards that he will ship his hoisting works of Saturday next. Mr. Helm has taken the mine for six months, and is to do \$10,000 worth of work on it, and when the time is up is either to take the mine and pay two dollars per share for the incorporated stock, or to deliver it over to the owners, together with all the ore he shall have taken out.

**THE ISABELLA.**—Another big find on the Humburg has come in light, showing interest on the surface for as far as the claims of 1,500 feet each have been located by A. J. McPhee, Geo. S. Demint, Wm. Gillespie and J. R. Darroche. The mine is situated half a mile northwest from the Resene, and one mile from the Swilling mine, and was discovered three weeks ago. They have a shaft down 15 feet, showing a ledge from three to four feet in thickness, and a pay streak fully 1½ inches wide. From the ledge the samples were taken with a view to ascertaining the average value of the rock that the owners adjudged to be shipping ore. These were brought to town yesterday by Col. H. A. Bigelow and George S. Demint, and this morning assayed by F. W. Blake, with the following result: \$1,431.35, \$1,792.34, \$2,624.91, \$1,659.76, \$313.79, \$450.80, making an average of \$1,378.52 per ton. A specimen of the ore, weighing 500 lbs., was taken from the shaft was also assayed, which went \$72.25. This certainly shows a splendid prospect.

**GLOBE DISTRICT.**—Arizona Enterprise, July 28: The health of the miners generally is good, notwithstanding the fact that the weather is hot and dry. The thermometer, at present writing, stands 105° in the shade. There have been few light sprinkles of rain, but not enough to lay the dust. Notwithstanding the bad times and dry weather, the miners generally seem cheerful and are

Continued from Page 82.

sons is to go to Truckee on the C. P. R. R., then take Webber's stage, which leaves Truckee Tuesdays, Thursdays and Saturdays of each week during the season. This route enters Webber valley from the east, and affords a view of the canyon and cataract described.

The principal approach is from the west, via the west gate of the Hennessy pass, connecting with Eureka, Nevada City, Grass valley and the narrow gauge to Colfax on the main railroad. This route is longer and much more expensive, unless visitors come, as many do, with their own conveyances. Families from that section move up here with their household goods and camp in the groves or occupy the cottages provided for season tourists. Besides these main entrances, the north and south passes admit equestrians as described.

Webber Lake in Winter.

About November 1st Webber lake is deserted alike by visitor and proprietor; one man being left in care of the property, to prevent the snow from breaking roofs, and, mayhap, to succor an occasional traveler crossing the Sierra on snow-shoes, or wending his way up to Meadow lake, where one or two families remain during the winter.

It has been the privilege of the writer to spend two winters at Webber's hotel, spreading his plants and other objects of natural history on the dining tables, and studying them at will for six months in the year, in no one's way and eight miles from a human soul. He has enjoyed some of the best weeks of his traveling life, and for there are about thirty such weeks usually, as in other places of such high altitude, the fierceness and power of the winds are simply terrible.

Snow often falls three or four feet in a night and six or seven small feet were once recorded between nine at night and sunrise. The wind piles it up in a beautiful shining Sierra along the north shore of the lake, its glittering pinnacles 15 to 30 feet high in front of the buildings. The lake will often remain open until late, a peculiarity of California climate. Tahoe lake, at the same elevation, being a vastly larger body, never freezes. The ice-covering of Webber, seemingly very good skating at times, is really always treacherous, crumbling to crystals to-day where it was solid yesterday. As the ice advances and retreats, and snow clogs the outlet, water rises over the ice and, freezing nightly, soon a covering of three or four feet is formed, over which old Boreas finds no impediment to his night work of Sierra-making.

The outlet pours a full stream over the cataract now, and presents a new creation. The rising mist congeals, and forms an immensè oval apron, covering the upper half of the plunging torrent, ornamented on each side by white fluted columns of ice supporting the sides of the apron. The ice being, as stated, so brittle, is often broken up in the stream above and its huge blocks hurled by the current down the cataract, thundering against the resounding apron in front and the jutting rocks in rear, send a roar of sound reverberating down the gorge that is truly sublime.

The four passes are packed deeply with snow and the groves so beautiful and animated in summer are dreary, snow-filled masses of tree tops, tracked only by the mouse-hunting otter, fox or coyote, and, on sunny days toward spring, by the prowling grizzly.

What a change of sounds, too! Instead of the song of gay revelers awaking the echoes of the forest from their boats in the center of the lake, the rattle of passing vehicles, the shout of boys scampering their steeds over the clean gravel, or even the chirp of birds and hum of insects—all is deepest silence, save at times the humanlike shriek of the cracking ice, or the angry, fitful howl of the wind in the bending pines. Only occasionally a daring spirit, skilled in the use of snow-shoes, ventures upon the ice to carry the mail to the hermit, and to catch a trout through the ice for the capricious taste of an invalid—the wholesale fishing of trout in winter, their spawning season, being justly prohibited by law. Only the glorious sun is a reliable visitor, and he timidly peers over the mountain peaks but a few hours daily, when the rolling clouds permit.

Before closing this brief description of Webber lake and its attractions, with a short biography of its worthy proprietor, the writer desires to make a personal statement. He has no interest whatever in the popularity of Webber lake, his home being in Sierra valley, 10 miles away—or rather, anywhere from end to end of the high Sierra—and he is writing these words entirely without the knowledge of good Dr. Webber. He describes these scenes as he has those of other popular resorts in California, because they are worthy of description and he would aid tourists and invalids in enjoying their paramount benefits.

Biography of "Good Dr. Webber."

Dr. David Gould Webber was born September 12th, 1809, in Livingston county, New York, of Scotch and Irish parents. At the age of five years his parents moved with their family to Erie county, Penn. At 13 he left home, buying his time of his father, to labor on public works in summer and go to school in winter. At 18 he leased himself to a physician for three years, receiving \$30 the first year, \$50 the second and \$70 for the third years' wages.

During this early period, when but a mere boy and with scanty means, he commenced the exercise of that practical charity and usefulness that has so distinguished him through life. For two years of this service with the physician he maintained 13 orphan children at school, paying all expenses of tuition, school-work, books, etc. One of these boys is now an eminent lawyer of Ohio.

Starting in the study of medicine with this physician, he soon bought out his patron's drugs, procured books and continued studying until 24, in the meantime commencing the business of merchandising, having an adopted boy for clerk.

At the age of the doctor (for he had been admitted to practice), married Margaret Bradish, of Erie county, by whom he had one child, James. He also adopted an orphan girl at this period. After six years of married life Mrs. Webber died. The last adopted girl marrying, he adopted another, also another poor boy. He then sold his practice in Erie, Canada, leaving the girl to be educated four years at an academy in New York. He then married. He also left his own son there with his grandmother for the better continuance of his education. The adopted boy he educated liberally in Canada, and he is now a skillful business man of New York. In Canada he adopted another boy, now a merchant of Illinois. The doctor remained two years in Canada, then removed to Chicago, a place where he engaged in the building and public works. He prospered in business, though always carefully honest, and his monthly bank account at Chicago often exceeded \$150,000.

[illegible]

millage and mining with varied results, and in the meantime built the Sierra county edifices, roads and bridges. In '54 he went to Sacramento valley for five years and raised wild horses. In '59 came up to Sierra valley, engaged in his profession, and in raising sheep, goats and cattle. In '60 built the hotel at the lake which soon after took his name, in '62 established a ranch in the north end, where he now resides in summer. During this period he fostered several poor boys, assuming also the care of a second cousin, Joseph C. Webber, and educating him to his own profession. The young man graduated at Toland Medical College, S. F., third in his class, came home to Sierra valley and commenced practice with most remarkable success, and in a few years had become so well known that he had the entire population, as evinced by the universal sorrow that was exhibited and still is often expressed, occasioned by the early death of this promising young physician in 1871.

Dr. Webber at his Lake.

It is at the lake, while sitting on the hotel porch or rowing a skiff and trolling for trout at the close of a delightful summer's day, that the good doctor has time to tell you of his numberless boys and girls and his interesting business adventures, described with deep feeling, and with inimitable zest. To the improvement of the premises and the comfort of his guests he has devoted the energies of the prime of life. He loves this spot as dearly as ever Swiss loved Alpine home, and during declining years he resorts here annually to meditate upon a life well spent, and to plan still other schemes of good.

As early as 1862 Dr. Webster, then building the Downville, hearing of this beautiful lake and valley on the Henness pass, hastened hither, hiring a guide for \$10, who betrayed the doctor and posted a penciled notice of location on a tree and would not remove it until paid \$50 more. In '66 the hotel was built, and for a few years after immigrant travel continued brisk over the easy pass; besides the discovery in '62 of the Meadow lake gold-bearing quartz and the quick up-building of a large city there made business lively, but after three years of determined labor it was found that the sulphurets prevented the Excelsior rock from giving out its gold in paying quantities. In the same year the large town was deserted. At the same time period the progress of the railroad over the Donner pass began to lessen the travel on the Henness, and gradually the Webster premises assumed the character they are noted for to-day—a health and pleasure summer resort.

There were no trout in the lake when first discovered manifestly prevented from entering it by reason of the high cataract of 110 feet. In '60 the doctor began introducing trout of two varieties, silver-sides and red-fish. Four years after he was enabled to set this delicious fish before his guests as desired. Subsequently other parties proposed to clear the lake, and the doctor was told that he was assured that it was always filled with trout, but the doctor proving his claim to the satisfaction of the Fish Commissioners and complying with legal provisions, has acquired possession of the fish, pays taxes upon them, and, assisted by the law, carefully guards against their being caught out during the spawning season, which would diminish one of the most enjoyable pastimes of summer and thus cut off one of the most appetizing items to the bill of fare.

The wealth of Dr. Webber has been reduced by his benevolent projects, the liberal assistance of relatives, (once his only friends), of his property to two brothers, by mining failures, and hard winters, to the value of a few thousands now, but still he has sufficient to prevent reliance for support solely upon the profits of his hotel or the practice of his profession. The poor and unfortunate are entertained gratis, until they can find employment, and the sick either in Sierra valley or those who come to the lake for treatment, if indigent, are cured free of charge.

Dr. Webber has two mortal enemies, against which he is ever on guard, erysipelas and typhoid pneumonia. An attack of erysipelas many years ago destroyed the sight of his left eye, another compelled the amputation of the index finger of his right hand. Pneumonia has recently brought the doctor twice to the verge of the tomb. The people of Sierra valley pray that he may long be spared to them, but whenever Death shall come, be it sooner or later, he will but recall the spirit of a true man which has been sent among us to illustrate the high capabilities, uses and destiny of humanity.

The monument of Dr. Webber is already erected—the noblest of monuments, grateful memories in the hearts of those whom he has fostered or cured. His lake, which must always be a resort for naturalists and pleasure-seekers while California is inhabited by a free people, will forever locate the scenes of his later deeds; while two pretty plants of the Sierra, *Ivesia Webberi* and *Astragalus Webberi*, lately distributed to the botanists of the world, have indelibly inscribed his name upon the records of science, to be spoken, written, printed and inquired about by the lovers of nature, of all languages, in all countries, through all time.

Webber Lake, March 4th, 1877.

## Silver in Oregon.

Silver in Washoe has been so immense and of a development so permanent that all other enterprises on the Pacific coast have been subordinate to and dependent upon the results attained in the production of that metal. In the meantime the continent has been scanned throughout the Pacific slope from Arizona to Alaska, for other Washoes, and although Oregon, Utah, Arizona, Montana, British Columbia, and also Alaska, have contributed to the stream of precious metals flowing from this coast, Nevada and Idaho are the only regions where silver-bearing lodes are found of a character to warrant the heavy investment of capital to an extent required for mills, shafts, tunnels, machinery, etc., to perfect the bullion for market.

After the discovery of the Washoe silver lodes it caused placer and quartz mining in California to hold a secondary place in the estimation of capital. The fabulous results of speculation in Nevada for nearly a score of years has so centered popular attention in that quarter that every source of finance has been drained to meet the assessments for developing the numerous argentiferous veins catalogued by the San Francisco stock boards on the Comstock and adjoining lodes; and it required all the speculative capital of the Pacific coast to develop those mines.

The silver-bearing regions of the Columbia basin, although as rich and extensive as Mount Davidson in at least two localities, have remained undeveloped merely because mining investments could not afford the heavy expenditures required in more than one locality at a time. From the signs of the times it is quite apparent that the best days of Washoe have culminated because the Comstock has been comparatively worked out by exhausting the attainable ore to a depth beyond which it seems no longer dividend-paying to delve.

Eastern Oregon, in Grant county, is the next region on the Pacific coast where true fissure veins of silver-bearing quartz of Washoe extent is found, and where silver-producing enterprise will next erect those stupendous and expensive

adjuncts of the business. The movement has commenced on Granite creek, about sixty miles from Canyon City.

The Monumental silver mining company, organized in Portland, (of which Wm. Grant, Esq., of this city is one of the directors) has the material on its lode to become the peer of the Gould & Curry or the Consolidated Virginia, if, like those corporations those interested will organize proper appliances for extracting the bullion. The company has located several thousand feet, and there is area for all Washoe to transfer its industry in the same vicinity, which is sure to take place in the course of no lengthened period. In the meantime, while shares are cheap and no assessment to be feared, as the company are only selling a limited number to expended in the development of the mine, it would be good business policy for our citizens to secure an interest before a "Washoe excitement" reaches the great Northwest.

We have gone into this detail to inform our readers that the next mining excitement bids fair to be in Eastern Oregon upon silver-bearing lodes, and we are anxious that our own citizens should have a share of those arising values which will pass them to the San Francisco stock exchange if they do not take time by the forelock and secure an interest at this time in what is soon to become the northwest bonanzas.—*Oregon Mountaineer.*

### The Dayton Ditch.

The *Sutro Independent* says: The work on the Dayton ditch—one of the largest irrigating ditches in the State—is fast approaching completion. The company of fifteen carrying on the work are chiefly citizens of Dayton, among whom are: W. W. Byron, C. W. Mallett, Jerry Gantz, David McClelland, A. Perkins, K. R. Hacket, Frank Hauger and George Barrett. The ditch begins at the Carson river, just below the Ophir dam, and extends along the river until near the mouth of El Dorado canyon, when its course is to the eastward. Its total length when finished will be six miles, and near its terminus a branch ditch, a mile and a half long, leading to the river at Gee's ranch, will be excavated, in order to afford facilities for irrigating a rich portion of land annexed to the Sutro tunnel grant and to carry off whatever waste water there may be.

Along its route thus far a number of small tunnels have been excavated, one of which is 100 feet long, and at least 100 rods of flume will be required before the work is successfully completed. The dimensions of the ditch are such as will carry, when the stage of water in the Carson is low, 1,600 miners' inches of water, which amount, it is thought, will be sufficient to irrigate the company's tract of 1,500 acres.

The work was begun last December, since which time it has progressed until it now reaches a distance of four miles. The remaining two miles, it is thought, will be completed in the course of two and a half months, when work will at once begin on the branch leading to the river. The cost of the enterprise thus far has been \$6,000, and its probable cost when finished will be \$10,000.

The company's land through which the ditch runs and is meant to irrigate, was taken up year ago under the desert land law, and is located on the other side of the Carson. It is nicely located, is fertile and abounds most luxuriantly in the mexicanstihle sagebush. Mr. Fawcett, from the State Surveyor General's office, has been surveying for the company and setting stakes for the subdivision of the land taken up.

Forest City Mines.

A correspondent writing to the Nevada *Transcript* from Forest City, says: This is one of the liveliest mining camps in the State, but yet it is not as lively as it has been, on account of the scarcity of water. They are unable now to run a full force in the Bald Mountain mine. This is the largest and best paying gravel mine in the State. Their tunnel is run in three-quarters of a mile, and the cars are drawn by a locomotive. They employ during the water season, three hundred men, but at the present time about eighty. The mine is under the superintendence of W. H. Willis, and is the best managed in the State. They have taken out since the mine was opened, over \$1,000,000. It is paying better this season than ever before. The North Fork company continue to take out some of the richest quartz ever found in the State. The ledge is well defined having two perfect walls, and varying from two to six feet in width. This mine is under the superintendence of W. Baylis. Up to this time they have taken out and worked in a hand mortar, over \$40,000. The rock still continues as rich as ever. They are now employing forty men, and are still running their main tunnel ahead for gravel. They have about one hundred and fifty feet further to run before striking the gravel. Up to this time the company has made no arrangements for the erection of a mill to crush the immense amount of quartz they now have on the dump, and it is daily increasing. It is designed to ascertain the full extent of the ledge, or sufficiently so to determine whether it will warrant the expense of putting up a mill. It will be decided definitely in a short time. The Mammoth Spring company are still running their main tunnel ahead. They are on the rim, and will have about two hundred feet to run before getting to the gravel, still the mine is paying expenses on the rim of the channel.

## Pioneer Reduction Works.

These works, which are established at Canada hill, near this city, says the Nevada *Transcript*, are now in full operation, and competent judges assert most positively that the new process is a success. The following is a brief description of the working of the ores, as witnessed by quite a number of our citizens a few days ago: The ore if wet is first run through a drying furnace. From thence it is conveyed by an elevator to a hopper, which deposits it in regular quantities in a revolving roasting furnace, where it undergoes very thorough oxidation. From the furnace it is conducted by means of elevators to hoppers, which feeds it into burr-stone grinders, similar to those used in grist mills, where it is reduced to a fine powder. From thence it is conducted to a settler or washer, where all matter that is noxious to quicksilver is dissolved and removed. From thence it is taken to a large amalgamating tank, where it undergoes a thorough process of agitation and mixing with quicksilver. The quicksilver, by means of a strainer and elevator, making a continuous circuit through the material in the tub. All the chemicals in the process are used in this part of the work, and only in contact with the quicksilver for the purpose of keeping it constantly in order. From this tank it is drained off into another tub called a "dolly," and from this to an agitating machine called a centipede, which is the last work done on the ore before it finally escapes down the waste sluices, except that the settling from the two last tubs are caught in a waste tank, and if found to contain matter worth reworking it is taken to the drying furnace and put through the process again. The ore passes from one point to another by means of machinery, which is automatic in its work throughout. Those who were present to witness the practical workings, we believe, generally united in declaring the process an undoubted success. It is the purpose of the company to erect machines as fast as the demand calls for them. They propose to work ores up very closely to a fire assay and to do it so cheaply that many mines, which will not pay as at present worked, will become valuable property. The machinery throughout worked to a charm and the results can be gained from the following assay made by J. J. Ott, of this city. The roasted material when it entered the amalgamator, after passing through the roasting furnace and the grinders, contained, according to Ott's assay, \$15.70 per ton. The clean-up showed that \$14.88 of it had been saved, and only 82 cents had passed off in the sluices. In other words, the percentage of gold saved was 94.8. The ore under treatment is generally conceded to be rebellious and hard to reduce. The time used in the reduction of this lot was only three and a half hours, whereas the regular time should have been six hours. Prof. Crosby asserts that the result is not better than the machine can do at all times, and he stands ready to demonstrate it to any one having ores to reduce. Prof. Crosby extends a cordial invitation to those having sulphurets or ore to be worked to bring them on and witness the test, and those interested in mining are also invited to go and see the machine and judge for themselves.

### Early Washoe Machinery.

Persons now visiting the Comstock, who have not been here since the early days, are much surprised to see the huge engines employed in all our large mills and in the hoisting works of the leading mines. The ponderous pumping machinery is also looked upon with astonishment, and contrasted with the slight and feeble apparatus that did duty in the same line of business in former times.

In the early days of Washoe, the stockholders of a mining company stood aghast and were amazed almost to speechlessness when their Superintendent ventured to ask for an engine of 60 or 80-horse power. They thought the company would be ruined by such extravagant notions.

When such engines were finally procured and set up in the mills and hoisting works, a day was appointed and scores of people—ladies as well as gentlemen—were invited to see them put in motion. A great feast was provided and spread in some part of the new works; speeches were made, champagne flowed like water and beer was drank by the barrel. Occasionally a band of music was present and dancing concluded the festivities. Companies that had paid out sufficient money to purchase an engine of 80 or 100 horse power became reckless, as it were, and no longer cared for expenses.

New engines of 500-horse power are started up, and nobody except those particularly interested knows anything about the matter; and, without a word to outsiders, pumps are put in motion that would have torn down the works of early days and washed all the revelers collected in them down the side of the mountain. All the machinery in our primitive hoisting works wouldn't have furnished ballast for a balance hob of the present day, and a section of the pump column now in use would then have made a first-class smokestack. — *Enterprise*,

WAGES IN SAN JUAN.—Miners in San Juan receive \$3 a day and board, or \$4 where they board themselves; boss carpenters, \$4@5; carpenters, \$3.50@4; stone masons, \$4@5; laborers, \$2.50@3; other trades about the same in proportion.

## Specie Payment Stamp Mill.

This is a new mill recently built on the north bank of Clear creek, says the *Colorado Miner*, near the center of the town of Idaho Springs. It is owned by the Sunshine mining company of Troy, New York; and is under the immediate superintendence of W. A. Peck, Esq.

The dimensions of this building are 30x40 feet; it contains three batteries of five stamps each, and is used solely for the treatment of auriferous quartz. The machinery is run by a 30-inch Baker turbine water-wheel, and the supply of water is unlimited.

The works have been in successful operation a little over a month, and with such encouraging results, that the owners are now preparing to put in 10 more stamps. Up to the present time the stamps, etc., have been kept running on mineral brought from the Specie Payment mine, which is the property of the Sunshine mining company; but as soon as the additional stamps are in place custom work will be attended to to some extent. In the present condition of the mill one and a half cords of quartz can be handled daily, and when the improvements which are now in progress are completed, its capacity will be nearly doubled. The stamps are kept running night and day; and the works require the attention of but one man on each shift of eight hours.

The means employed for the extraction of the precious metal is known as the "wet amalgamation process." A small stream of water is kept continually running through the stamps, and on each side of the dies narrow copper vessels are arranged, and closely confined so that the water or amalgam cannot escape except through the proper channel. The quicksilver is placed in these coppers and amalgamates with the gold as it is freed from the rock by the stamping process. The principal portion of the amalgam is retained in these receptacles, though a considerable amount passes out with the water and tailings over slightly inclined copper tables, to which a small percentage of the amalgam adheres. At the lower edge of these tables coarse blankets are spread, over which the water holding the tailings in suspension passes; here the small particles of iron pyrites and quicksilver are deposited, while the lighter residuum is washed away. The blankets are carefully washed about 18 times in 24 hours, and the resulting sediment is transferred to a "dolly-tub;" water is added and the whole is agitated by a screw wheel for a short time; more of the refuse is carried away by the water, and the tailings—still more concentrated—are placed in the amalgamating pans, of which there are three. Here the mass is triturated still finer by an arastra-like process. Nitrate of mercury is added which attacks the iron and frees the quicksilver, which in turn unites with the gold; the refuse is then drawn off and the amalgam is collected and retorted.

Everything is cleaned up and the amalgam retorted about twice each week. The greatest care is taken to prevent the washing away of the amalgam, and the waste of quicksilver is exceedingly small. The appointments of the mill are good, and, apparently, it does not depend upon anything but the permanency of the mines for its successful continuation.

## San Juan Reduction Works.

The following list of mills, smelting works, and concentration establishments now erected in the San Juan will be found of use not only to miners but to the scores of metallurgists, graduates, and undergraduates of mining schools who are preparing to make a study this summer of gold and silver beneficiating works. We have prepared it with great care, giving the capacity and system employed in each, and other notes of interest:

Pennsylvania works, Rosita. Capacity, 12 tons. System, roasting and lixiviation, terminated by precipitation or amalgamation to suit varying classes of ore. Ores, sulphurets of silver, gray copper, and galena, in a baryta gangue. Steam power.

Mallett's works, Rosita. Capacity, 10 tons. System, roasting, leaching, and precipitation. Ores, as in the last case. Steam power.

Crooke Bros.' works, Lake City. Capacity, 50 tons. System, dry concentration, leaching, and precipitation. Ores, argentiferous quartz, galena, and blende, with iron and copper pyrites.

George Green & Co.'s works, Silverton. Capacity, 10 tons. System, lead, smelting. Ores, mainly heavy galenas.

Animas Forks mining company's works, Animas Forks. Capacity, 35 tons. System, wet concentration.

Van Gieson's works, Lake City. System, roasting, lixiviation, and precipitation.

Rough and Ready works, Silverton. Capacity, 10 tons. System, same as Green & Co.'s at same place.

Melville silver mining company's works, Silverton. System, crushing and amalgamation by the Walker process.

Besides these there are a number of small works scattered at different points, the most of which have not yet been placed in complete running order.

The addition to Crook's works at Lake City are being rapidly pushed forward. When completed their capacity will be over one hundred tons of ore daily. This includes the concentration, stamp, and smelting works.—*Colorado Springs Gazette*.

## USEFUL INFORMATION.

## Combustion of Oily Refuse.

We give below a valuable report, taken from the columns of the *Woolen Manufacturer*, of certain experiments recently made in England, with the various oils in common use in factories. The results reached by Mr. Coleman are the same as have frequently been obtained by chemists in this country. We commend the article to the attention of our readers generally:

Mr. J. J. Coleman, of Glasgow, has recently transmitted to the *Société Industrielle*, of Mulhouse, France, a memoir on the spontaneous combustion of oily refuse, and on the relative inflammability of the different oils employed for lubricating purposes. He describes a series of experiments upon fragments of cotton, linen, jute and woolen waste, saturated with oils of different natures. The materials were placed in a box of tin, having a double bottom in which steam entered, so that the part which received the refuse could be maintained at a temperature of 180° Fahr. A thermometer was inserted in the oily substance so that the variation of temperature occurring therein could be noted.

The results obtained show, first, that any vegetable or animal oil inevitably takes fire after a few hours, under the above conditions. On employing cotton waste, the mass burns quickly and with flame, in contact with the air. Wool refuse is slowly transformed into a black carbonaceous mass. Second, the addition of mineral oil—known as lubricating mineral oil—serves to retard the spontaneous combustion of vegetable or animal oil if mixed in small quantity. If a large amount be added, inflammation is entirely prevented. The mineral oil used by Mr. Coleman is a very dense product, having great viscosity and emitting no inflammable vapors, even in contact with an ignited body at any point below 338° Fahr., in other words, remaining safe at temperatures at which mixtures of less dense mineral oil or colza oil burns. The addition of 40% of mineral oil is sufficient to prevent spontaneous combustion. Twenty per cent. doubles the time necessary to determine conditions favorable to the same.

There is another advantage to be gained by mixing mineral oil with that of vegetable or animal origin, in that the latter is thereby prevented from resinifying, or thickening, on prolonged exposure to the air. Mr. Coleman exposed in his hot air bath for a period of 48 hours, vessels containing olive, colza, sesame and cotton seed oils. The first thickened, the second the same to a greater degree, the third still more and the last yielded a semi-liquid, amber colored mass. The addition of 20% of mineral oil caused all to remain perfectly fluid. The author concludes that, for the lubrication of machinery, it is advantageous to employ a mixture containing as much mineral oil as possible, while retaining the material at the proper degree of viscosity. Colza and other oils employed for lubricating heavy machinery are greatly improved by the addition of from 10% to 20% of mineral oil, the small viscosity of the former preventing a mixture of greater proportions of the latter. For spindles, on the contrary, it is better to use a larger amount of mineral oil, making a mixture of about the viscosity of sperm oil.

## Keep Circular-Saw Teeth Sharp.

In the "Lumberman's Hand Book" issued by Messrs. Diston & Sons, are found the following hints: Makers are annoyed by having saws returned for repair in such a condition that it is impossible they should go through the wood, from the miserable way in which they have been filed and set—some jammed all to pieces, some not half filed, some not filed true on the face or back, while others are all shaves but the right one in the throat, leaving no chamber-room for dust or chips. Some saws have a bad pitch, some no pitch at all; some out of round; some with irregular or long and short teeth, one up and one down. In many cases they are returned broken. Why? Each tooth of a 24-inch circular saw goes through the wood 2,000 times per minute, 120,000 times per hour, 1,200,000 times per day, and if not sharp, the saw is strained at the root of the tooth thus often, which frequently not only closes the set, but must eventually break the saw; for although steel is strong, continual straining will make it tender, and it must break. The tooth becomes dull on the side or under the point in proportion to the amount of feed; thus, if the tooth takes one-eighth inch hold at each revolution, it will become dull for one-eighth inch below the point, or more if the feed be greater. A diamond will not cut if dull; why should a saw? A few minutes filing two or three times a day would save ten-fold the amount of time and labor expended in running an imperfect dull saw, also making a saving in the amount of power consumed, and a heavy percentage in the quantity and quality of lumber cut. It is a mistaken idea that there is a saving by not taking time to sharpen a saw. If it were a razor, and the man that works it obliged to shave with it, it would be kept sharp. It is quite as essential that a saw be sharp, as a razor or plane, or any other cutting instrument; and when proud, or full and sharp, it does not require one half the set or power on the same feed.

**DECISION ON FULFILLMENT OF CONTRACT.**—We read in an exchange that after four years' litigation, a case has been decided in England which is of interest, as establishing a well recognized principle of law. It determines that when iron is passed by a buyer's engineer and a certificate given, the consumer thenceforward has no right to sue for damages for any defects which may afterward appear. In 1871, Messrs. Hopkins, Gilkes & Co., of Middlesbrough, contracted to supply a large quantity of iron rails and fish plates to an Anglo-Russian railway company—the Dunnberg-Witepsk. The rails were rolled under the superintendence of a representative of the engineer (Sir John Hawkshaw), and he watched them at every step, testing them whenever he chose. The rails were completed according to contract, and Sir John Hawkshaw gave the necessary certificate, after which payment was made. The rails were laid down, and, after standing the severity of a Russian winter, various defects were noticed in them. The railway company at once sued the manufacturers for £90,000 damages, for what they alleged to be breach of contract. This was in 1873. The matter was referred to arbitration, and the arbitrator, Mr. J. B. Maule, Q. C., decided in favor of Messrs. Hopkins, Gilkes & Co.; but before making his award, he stated a special case to the law courts, raising the question as to the finality of the engineer's certificate. In delivering their opinion on this, the judges unanimously agreed that the plaintiffs' right of action was destroyed when the rails had been completed and certified as being according to specification.

**THE PARIS EXHIBITION.**—Sir Julius Vogel, writing to the *London Times*, suggests that at the close of the forthcoming International Exhibition at Paris, there should be a supplementary exhibition of all the articles which are praised by the jury. He says: "I cannot fancy a more useful, enjoyable and instructive exhibition than this would be, comprising, as it would, in a comparatively small space, all that was most excellent and economically valuable in every variety of production and manufacture. The prospect of this subsequent exhibition would be an enormous incentive to exhibitors of a really good class. To occupy a place in the prize exhibition would mean the certainty of their goods being examined and appreciated by many thousands of intelligent people."

## GOOD HEALTH.

## Sunstroke and Apoplexy.

**EDITORS PRESS:**—To avoid sunstroke it is well to place a wet cloth on the head; but working-men cannot well attend to this. Use two linings in the top of the hat. They may be of paper or cloth, one blue, the other yellow, and are worn as a covering in your hat. For a sudden remedy, as a substitute, use green leaves.

I don't approve of using ice or cold water about the head in sunstroke or apoplexy. If taken in time, either can be cured and the person afflicted restored at once. In using cold water Nature, to restore the parts, sends hot blood wherever cold applications are used. Tepid water prevents the rush of blood and will cool the system the best.

Where you find a case of sunstroke or apoplexy, as soon as possible, apply water heated to from 110° to 115°. Use two or three pailful. Pour it on in a small stream; let it fall a few inches, directly on the back head at the junction of the cerebellum with the spinal column, in or near the hair. Then set the patient up and rub dry. The warm water passes off over the cheeks. Then apply alcohol or stimulants to the neck and back of the head. This is a remedy not known in medical practice and the recipe is of great value.

Wool is a non-conductor of heat, and there can be no objection to wearing it in warm or hot weather. Fifty years ago, persons on a farm wearing woollen clothing were derided; all wore tow cloth in Vermont. Light woollen goods and thin, so that air can pass through, are better and cooler than thick heavy cloth made from flax.

In sunstroke and apoplexy very hot water should be applied to the feet and ankles immediately; (hot packs will do.) This draws the blood from the head.

As to using blue lights and other prismatic lights of glass, I think I am the first that used them, scientifically, in this country.

Rutland, Vt.

SOLOMON W. JEWETT.

## Marsh Malaria.

The following, which we take from *Harper's Weekly*, gives some interesting facts with regard to a theory first broached during the war by Dr. J. H. Salisbury, then a resident of Cleveland, Ohio, pending investigations as to the origin of chills and fever, which were much talked of at the time. We believe he succeeded in cultivating this disease in ordinary flower-pots, and propagating it also by bringing persons within the influence of the disease-producing plants:

One hypothesis in regard to the origin of marsh malaria refers this to the development of certain microscopical growths, which are sup-

posed, by their dissemination, to effect a lodgment in the human system, and there set in motion organic changes, producing the various phenomena of disease.

The subject has been elucidated by the recent researches, in Rome, of Messrs. Langi and Terrigi, who have been studying the microscopical fauna of the Roman marshes. They find, in the cells of the algae collected there, certain dark granules penetrating into the endochrome or into the chlorophyll of algae having this substance. These become more and more developed with the death and decay of the algae, and finally turn black, and either cause or accompany a condition of putrefaction which results in their extensive dissemination.

According to the authors mentioned, the marshes of the Campagna, in the winter season, develop large masses of this algae, which become decomposed by the drying up of the ground, afterward producing planarianous land plants. Toward autumn the marshy portions of the undried land exhibit a corrupting layer of slime, abounding in the dark granules referred to, and various animal infusoria. These are found in abundance in the atmospheric dust of the Campagna, and are largely developed from it by cultivation.

The pigment granules found in the liver and spleen of individuals suffering from malaria, have similar properties to those of the ferment granules in question, and they can be developed quite similarly. Terrigi has found that the best method of preventing the decay and development of these granules is in the application of chloride of lime, of lime, or of chloral. A filtering of the atmosphere several hundred feet above the surface of the earth, revealed the presence of these bodies, which also appeared in the liver and spleen of guinea pigs that had been kept for some time at the level of the marsh.

## United Work for Health.

How fitting that the mothers of the country should join hands and brains in the service of the beneficent goddess Hygieia. A sure note of genuine progress has been sounded by the representative women of Louisville in the formation of a society, whose "special aim is to promote among women a knowledge of the human system, the laws of life and health, and the best means of relieving sickness and suffering."

The articles of the constitution give a condensed statement of the aim of the society: The society shall provide instruction upon all subjects belonging to the science of man, especially hygiene, physiology, psychology, and anatomy in their practical bearings upon the prevention and cure of disease, the training of children and youth, and the general improvement of the human race. But no subjects shall be introduced for consideration of the society which have not a direct bearing upon social and personal improvement and happiness.

The society shall procure a collection of apparatus, illustrations, engravings, etc., as a physiological museum, to which the members of the association shall have access, and a suitable library for the use of the members.

At the first meeting 100 members were received. When the mothers began to ask for thorough instruction upon such subjects it is a happy augury for the future of their children. For, alas, too many of the mothers, in the past have been fed upon the sour grapes of ignorance, and "the children's teeth have been set on edge."

**RECOVERY FROM ELECTRIC SHOCK.**—The *Philadelphia Inquirer* describes a case which is somewhat hard to credit. It says a young man named Warrick, who lives near Chew's Landing, New Jersey, was struck by lightning while in a field near his house. The stroke shattered a tree that was some distance from where he was standing, and prostrated him. It was believed he was dead when picked up, and for several hours afterward he gave no sign of life. His father applied to Dr. Urquhart, who advised Mr. Warrick to apply to his son's spine and waist cloths soaked in a mixture which the doctor made for him out of oil of cayenne and water, and with whiskey, of which about three tablespoonfuls were added to the cup full of water. Mr. Warrick did as he was directed, and his son, although he had been lying in a stupor for 16 hours before the application of the cloths was made, spoke in about five hours after the first application. He has since been progressing favorably, and it is not unlikely that he will fully recover. The case will probably be brought to the attention of the medical universities of Philadelphia.

**CORRECTIVE IN LEAD POISONING.**—Workmen employed in the manufacture of white lead are always liable to lead poisoning, both by inhaling the dust and in touching the lead with the hands. Various correctives for this have been employed, and among these the latest and most simple is a careful washing of the hands in petroleum. Three washings a day are reported to be sufficient to prevent all serious danger of poisoning. The benzole in the petroleum is said to scour the skin and remove the dust of lead, and the fatty substance in the oil prevents the absorption of the lead salts. The experiments made with petroleum used in this manner give such good results that it is proposed to use the same material as a guard against poisoning in other industries where the salts of copper or mercury are employed.

# MINING AND SCIENTIFIC PRESS

Advertising Rates.	1 week.	1 month.	3 mos.	12 mos.
Per line.....	.25	.80	\$ 2.00	\$ 5.00
Half inch (1 square).	\$1.00	\$3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Four insertions are rated in a month.  
Subscription in Advance—Postage paid—one year, \$4; six months, \$2.25; three months, \$1.25. Remittances by registered letters or P. O. orders at our risk.

WRITE FOR THE MINING AND SCIENTIFIC PRESS. We invite not only professional men, but practical miners and mechanics to contribute to our columns. All communications will be kindly treated. Authors, as well as readers, will be benefited by corresponding.

THE ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

ADDRESS all letters to the firm, and not to individual members, or others, who may at any time be absent.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:

Saturday Morning, August 11, 1877.

## TABLE OF CONTENTS.

GENERAL EDITORIALS.—Locating and Describing Mining Claims; Cochran's Improved Cam; A New Horse Boot, 81. The Week; The Errors of Mining in the Past; Our New Offices; Big Bullion Shipments; Rich Showing from Arizona; Items of Interest from the Mines; Heat Underground, 88. The Yuba River Levee; Opening Exercises of the Twelfth Industrial Exhibition, Art Galleries, 82. An Index of Our Manufacturing Statistics; Patents and Inventions; Notices of Recent Patents, 92.

ILLUSTRATIONS.—Improved Sectional Cam; Fennell's Improved Boot, 81. Levee on Yuba River to Protect Farming Land from Tailings, 89.

MECHANICAL PROGRESS.—Cold Punched Nuts; What is Needed to Drive an Engine; Keeping Out Dust and Cinders; Clay Tie; Weighing the Strength of Wire; Steam Cars on City Streets; Progress of Street Railways; Good for the Future; Air for Armor Plating, 83.

SCIENTIFIC PROGRESS.—Oligochaeta; Are Copper Salts Poisonous? Soudstrom in Rome; Columbian; The Cossacks and Science; Making Speech Visible; Age of Sun and Stars; New Sponges; Coning, 83.

MINING STOCK MARKET.—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments; Meetings and Dividends; Review of the Stock Market for the Week, 84.

MINING SUMMARY.—From the Various Counties of California, Nevada, Arizona, Idaho, and Montana, 85-92.

GOOD HEALTH.—Stroke and Apoplexy; Marsh Malaria; United Work for Health; Recovery From Electric Shock; Corrective in Lead Poisoning, 87.

USEFUL INFORMATION.—Combustion of Oily Refuse; Keep Circular Saw Teeth Sharp; Decision on Fulfillment of Contract; The Paris Exhibition, 87.

MISCELLANEOUS.—Webber Lake and Its Attractions, 82-83. Silver in Oregon; The Dayton Ditch; Forest City Mines; Pioneer Reduction Works; Early Washoe Machinery, 86. Specie Payment Stamp Mill; San Juan Reduction Works, 87. Mining Affairs in Idaho; The Ontario Mine; Wake Up; Robbers' Claim; The Bearville Placer in Cheap Labor in New Mexico; The Largest Station in the World; New Reagents for Free Mineral Acids; Hot Springs of Ouray, 90. Table for Converting the Various Weights and Measures into the Metric System and Reverse, 92.

GENERAL NEWS ITEMS on page 92 and other pages.

## The Week.

In connection with mining matters the principal event of the week has been the dismissal of Curtis as Superintendent of the Ophir, Mexican and Union Consolidated mines, and the appointment of W. Hendy, Superintendent of Imperial Con., in his stead. The affair has created considerable talk in mining circles, and is elsewhere referred to in this issue.

The heaviest single bullion shipment ever made from the Comstock was made this week. It consisted of 173 bars, aggregating \$771,446. It came principally from the bonanza mines, which produced last month \$3,000,000. Improved prospects are met with in Overman, Justice, Yellow Jacket and other mines, and the undiminished yield as well as increasing good prospects of the bonanza itself, give a hopeful and encouraging look to the whole mining situation.

The testimony in the Eureka Consolidated mining suit is now all in and the array of experts have been dishanded. The decision has not yet been rendered. The testimony will shortly be published in full, so that we will have an opportunity of comparing the statements made by the experts, some of which, we are told, were quite extraordinary.

The city has had the infliction of a large fire this week, destroying buildings covering over two blocks, but the loss is light compared with that with the area of the fire.

The Mechanics' fair opened this week, and we give in another column the opening address of the President of the Institute. We shall give all there is of interest in connection with this exhibition during its continuance.

## The Errors of Mining in the Past.

During the excitement that followed the discovery of the Comstock lode, almost the entire State of Nevada was overrun by prospectors, who, in their ignorance and hurry-scurry, proceeded to locate everything having even the semblance of a mineral-bearing lode, and, without taking proper measures to determine whether they contained any gold and silver or not, hastened to lay out mining districts all over the country so imperfectly prospected and hurriedly covered up with these mining claims. Then followed the organization of companies, the most of them incorporated with a large amount of nominal capital, for the ostensible purpose of opening up and working these so-called mines.

It being generally believed that the ledges taken up contained enough of the precious metals to warrant their exploration, many people on this coast, and even many in the East, felt disposed to adventure some portion of their means in this new and promising industry, which resulted in a good deal of money being embarked in it during its earlier stages. As ignorant of ore extraction and reduction as they had already shown themselves to be of searching after and securing deposits of value, every manner of folly and mistake was committed by these embryo miners—some the results of ignorance and inexperience, but more, perhaps, of gross negligence, criminal mismanagement, or downright fraud; the history of these operations being anything but creditable to the business sense, to say the least, of those who were more especially responsible for them.

The people in their confidence contributed freely, and the recipients of their favors spent it in a princely way. Everybody was enthused and everybody blundered. The over-sanguine and self-sufficient rushed to the front. Men without any experience in the business were appointed superintendents of mines. House carpenters undertook to put up mills, and every man assumed to be his own metallurgist and assayer. As a consequence, nearly everything was done wrong. Costly mills were freighted to remote sections and put upon lodes before any developments had been made, and very often upon such as contained little or no ore. Shafts and tunnels were started at the most improper points; roads were constructed and towns built far in advance of the wants of the districts explored.

It would be thought that a few years of this sort of experience would have sufficed to bring people to their senses and put a stop to this profitless expenditure. But it did not; money continued to be contributed freely, and this reckless style of disbursement went on with little abatement for eight or ten years, the business having met with its first signal check in the White Pine fiasco, though this did not by any means prove to it a final extinguisher. We have since that had a number of mining excitements, which, though of a rather milder type, have not failed to cause their victims much disappointment and loss, as the deserted towns and ruined mills of Schell Creek, Panamint and various other nearly abandoned districts sufficiently attest.

While so much of a disparaging kind has been occurring in the department of practical mining abuses of a still more reprehensible character have marked this speculative branch of the business; and this, too, without the poor plea of ignorance and inexperience to partially excuse their commission.

In view of the foregoing facts, so discreditable to our good name as a community and so damaging to our financial sagacity, it seems to us that all parties engaged in mining pursuits, in whatever capacity or department of the business, should feel called upon to see that it is conducted in a more honorable manner and upon a more business-like basis hereafter. Never elsewhere have such grand opportunities been presented for the profitable employment of labor and capital as here. Never before has any industry been sustained with a liberality like that which has backed up mining on this coast. For nearly 20 consecutive years it has been nourished with a generosity appalling in view of its meager reward. We are not un mindful of the vast treasures that have been gathered from our gold and silver mines, nor of the splendid success that has attended individual effort in thousands of cases. These are well understood and have been sufficiently talked about. It is the other phase of the business that now requires to be considered. Having said so much in glorification of past production, let us see what can be done toward correcting present abuses. As a first step towards this end, let the same economy be exacted and the same rigid responsibility attach in this as in every other calling. The idea that all who invest money in mining ought to realize a speedy fortune out of it should be dismissed. Let men cease to gamble, and engage in this as they would in any other legitimate vocation, keeping in view security of investment and the certainty of a moderate rather than taking desperate chances of a large profit. A radical reform must be worked or capital can no longer be commanded for prosecuting this business.

OWING to the low stage of water in the Carson, the Eureka mill is only working at about one-third its capacity, crushing about 60 tons per day on an average.

## Our New Offices.

The business offices of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS were recently removed to more convenient and commodious premises on the corner of Pine and Sansome streets. This is on the same block as our former offices but on the Pine street corner—No. 202 Sansome street. It is nearer to the central street of the city—Market street, and in a fine, handsome building, where we have more room for the different branches of the business. Dewey & Co. have leased these premises for a term of years and are now fitting them up in good style, so that our facilities will be much improved. The bookkeepers, mail-clerks and engraving department will have more commodious quarters than heretofore.

Dewey & Co.'s Patent Agency is also greatly benefited by the change. The consultation rooms are more commodious and convenient and more space is given for the library, models, etc. This change has been made necessary by increased business, for which our former facilities were inadequate. The new location is a central one, in a first-class building and is far superior to that we leave. As we have leased the new premises for a term of years, we have fitted them up with a view to the future as well as the present.

The editorial, composing and press-rooms of the MINING AND SCIENTIFIC AND PACIFIC RURAL PRESS still remain at 414 Clay street, where they have been for the past eight years; but our correspondents and subscribers will remember that the new business offices are at 202 Sansome, about three-quarters of a block south of the old offices.

## Big Bullion Shipments.

The heavy bullion shipments from the Comstock mines are such as to astonish every one, even those familiar with money matters. It must surprise them even more than others, as miners know how to appreciate such figures. The single bullion shipments seem to be getting bigger and bigger. The *Virginia Enterprise*, of the 7th inst., says on this subject:

"These 'biggest shipments' are getting to mean something these days. There was a time when the Belcher, at three hundred and thirty odd thousand dollars, made it, and it was thought wonderful, as indeed it was. Then little by little, these 'biggest shipments' grew bigger yet. At first some \$300,000 were added and bragged over. Then \$400,000 *plus* was reached. And then a jump of over \$100,000 was taken, and so the biggest was increased till about \$670,000 was reached, and there the record has stood for some time past.

The amount shipped last evening by the bonanza mines was 173 bars, aggregating \$771,446.85, and yet there was bullion left in the office which was not taken. Of these shining bars California turned out eighty-six, valued at \$381,084.67, making a total to date and for the past fiscal month of \$1,399,331.79. The Consolidated Virginia shipped last evening eighty-seven bars, valued at \$330,362.18, making a total to date of \$1,305,023.64. The Consolidated Virginia clean-up is to come. The total for the two mines so far this month is \$2,704,375.43. The Consolidated Virginia clean-up will increase this to about \$3,000,000."

The amounts for July are as follows: California, 328 bars, valued at \$1,399,331.79; Consolidated Virginia, 245 bars, valued at \$1,305,043.64.

## Rich Showing from Arizona.

There has been open to public inspection for the past few days a lot of remarkably rich ore, or rather, perhaps, we should say, chunks of metallic silver, lately brought from Arizona. This lot, which consists of 2,230 pounds, is to be seen at the office of the Germania Life Insurance Company, 216 Sansome street. It comes from what is known as the Stonewall Jackson claim, in Globe district, and it is calculated that it will yield at the rate of \$20,000 per ton, most experts estimating the yield somewhat higher.

This lode carries a streak of similar stuff as far down as it has been opened, a depth of over 80 feet. This streak, which is not over half an inch wide on the surface, gradually expands until it reaches, at the depth of 45 feet, a width of four and one-half inches, which it holds on an average as far down as the lode has been opened. On each side of this rich streak is a stratum of ore one foot thick that will average \$1,700 per ton. This mine is owned wholly by Messrs. McMillon & Harris, who located it in February, 1876. They have 1,500 feet on the ledge, which at many points shows this extremely rich ore in the croppings. They have a five-stamp mill on their mine, which is running on second-grade ore. In asserting their ore they have to reject the richer pieces, these being too near metallic silver to admit of being milled. The foregoing facts we get from parties recently from the mine; the lot of ore, to be seen as above, speaking for itself. It is dirty-looking stuff, presenting a very different appearance from the highly crystallized, sparkling ores from the Silver King, also in Arizona. The Jackson lode can be traced, it is said, for a long distance, as many as 40 different company locations having already been made upon it.

## Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective Superintendents on file at the offices in this city:

The face of the east shaft, 1400-foot level of the Overman, is showing a very promising formation, and is perfectly dry, the waters having all disappeared.

Last week, Chollar turned out 495 tons of ore, assaying an average of \$21.75 per ton. The ledge in the stope of the Empire (G. V.) is still very small and ground hard.

The upraise from the 100-foot level of the Justice continues to develop fair milling ore as well as the stopes from either end of the same upraise.

The winze from 120-foot level of the Hussey, has shown ore all the way down. The winze has proven a continuous body of ore for the depth of 140 feet, with a better vein of ore at the bottom than in any part of the winze, thereby changing the 230-foot level from what was supposed to be a barren, to a good ore-producing level.

The shaft in the Joe Scates is down 110 feet, the ledge working well.

In the Gila, the progress made last week, three feet in crosscut and four feet in drift, has been very small, owing to the hard nature of the rock in one, and to the time which is consumed in taking out and separating the ore in the other. They have now upon the dump about 30 tons of ore ready for the mill, with a lot unsorted. No stoping has been done yet, as the openings to that part of the mine have been filled with waste which had to be removed before any number of men could be employed.

The ore body in the Leviathan is about seven feet wide, containing many fine streaks of ore.

From the Ophir they are taking out 10 tons of ore daily from stopes on the 1366-foot level, which they are storing in the ore-house. The ore assays have been running down for 10 days previous, which can only be attributed to the ore pinching out.

The ore stopes in the Grand Prize present the usual fine appearance, with no indication of diminishing in either quantity or quality. Both mills are running steadily.

The ore east drift in 1150-foot level of the Justice is in promising vein matter.

The ore operations at the Con. Virginia mine for the week ending on the 3d were as follows:

1200 to 1400-foot levels, tons.....	696
1550-foot level.....	40
1050-foot level.....	2,187

Tons extracted.....2,833

Tons sent to mills.....2,830

The operations at the California mine for the week ending on the 3d were as follows:

1500 and 1550-foot levels, tons.....	1,624
1000-foot level.....	3,121
1050-foot level.....	319

Tons extracted.....5,064

Tons sent to mills.....4,880

It will be seen that the repairs to the main shaft between the 1500 and 1550-foot levels has not diminished the ore production, the total for the previous week being 5,100 tons.

## Heat Underground.

Some of the drifts on the lower levels of several of the Comstock mines are found to be so hot that it is next to impossible for the men to work in them. When they can work it is to great disadvantage, and considerable labor and money is expended by the companies to supply fresh air. In some cases, men can only work a few minutes and then run out to cool off. In the Consolidated Virginia mine, the face of the north drift on the 1750-foot level from the Gould & Curry, near the east wall of the ore vein, is so hot that it is necessary to keep a close, tight box, or cooling room, in close proximity to the workmen, in which the temperature of the air is kept down by compressed air, so that the men may cool off and change every few minutes. Another of these cooling boxes has to be placed at a half-way point in the drift for the use of the men who run the cars in and out.

The Savage incline, also, at a point near the water, is so hot as to be almost beyond human endurance. But for their shirts the skin of the men would be blistered as though by a jet of scalding steam. A man from the mine showed an *Enterprise* reporter a blister on his arm that was nearly as large as a man's hand. This blister was caused by exposing his arm at the bottom of the incline. It is so hot down at the water that in screwing a nut on the end of a bolt one man would be able to do no more than fasten a monkey-wrench upon it before he would have to retreat. Another would then descend and give the wrench two or three turns. One day last week the giraffe got off the track well down the incline, and in trying to replace it one of a small party of men was so overcome by the heat that he fell down in a state of insensibility. His companions carried him from a point between the 1700 and the 1900-foot levels to the 1300-foot level of the Hale and Norcross mine, where he could obtain a mouthful of fresh air. He was still unconscious when he reached the point named. The Hale and Norcross mine is now quite cool, the draft in it having again changed, being once more down the main shaft.

## The Yuba River Levee.

We present herewith a cut representing this structure, a detailed description of which, and the purposes for which it was built, appeared in our issue of the 14th ult. This levee, as therein explained, was thrown up to protect a large body of rich farming land situated along the south side of the Yuba, from threatened inundation by the tailings brought down from the hydraulic mines located along the main stream and its branches; which material had, in former years, covered up wholly or in part some 1,500 acres of similar rich bottoms on the opposite side of the river.

In this cut is exhibited the Yuba, with its inter-communicating sloughs, making its way centrally across the wide expanse of interval; the section of the river here shown reaching from its point of debouchment from the foothills to its junction with Feather river, a distance of about nine miles; also the levee lately constructed, extending also from the foothills to the line of the California and Oregon railroad, which crosses these flat lands on a high embankment. This structure has been located about one-half mile back from the bank of the river, in order to make room for the water during its high stages. It is eight miles long, about 25 feet wide on the bottom and 12 feet on top, with a slope of two to one on the inner or land side and three to one on the water side, as shown by the cross section in the upper right hand corner of the diagram. Its height varies somewhat with the natural inequalities of the surface on which it is located, the top of it being, at most exposed points, five feet above flood line, and everywhere sufficiently above high-water mark to protect the lands behind from any danger of overflow. Through it have been placed at suitable points large iron pipes with gates, for letting out any water that may accumulate in the rear.

The outside slope of the embankment, for a distance of two miles, has been covered with a facing of willow brush to shield it from the action of the water, this section having been built largely of the hydraulic tailings, composed of sand and other loose material. Another mile has been protected for the same purpose, by a substantial brush fence.

The body of land protected by this levee, amounting to about 30,000 acres, all of good quality, is indicated by the parallel lines drawn diagonally across the cut covering the space between the Yuba and Dry creek; the land already overflowed being represented by the horizontal lines adjoining on the north. The dyke on which the railroad runs serves to keep out any back water that might come in from that quarter.

On a portion of the new, or as it is generally designated, the O'Brien levee, the county road has been located, the original dimensions of the embankment having been enlarged for that purpose. This levee will furnish an excellent roadbed across a stretch of country heretofore almost impassable to teams during wet weather. The most useful end subserved by it, however, will be the rescuing of so large a tract of fine agricultural land from the injury that, in its absence, must sooner or later have overtaken it; and not a little praise should be awarded the generous and enterprising miners, to whose efforts this improvement has been mainly due. Towards defraying its cost, very nearly \$50,000, the mine and ditch owners along the Yuba and its tributaries have contributed more than three-fourths, besides giving to it largely their personal attention. Amongst these who in this latter particular have made what, to men with their extensive business engagements, may be considered large sacrifices, are James P. Pierce, James O'Brien and James McManney, of the Smartsville mines. Hamilton Smith Jr. has also contributed freely of his time and professional services toward promoting the enterprise.

By way of correcting an error in our previous account of this work, it should be mentioned that the sum given by Yuba county was but five instead of ten thousand dollars, as therein stated.

THERE are in this city no less than 47 iron foundries, machine shops and boiler factories, employing upwards of 3,000 hands, and expending about \$1,000,000 annually for wages. This is only one class of the various manufacturing industries in San Francisco. It is no more than proper that an annual exhibition should be held in which to display the results of the labor of these mechanics. Other branches of manufacture, of course, help to swell the ranks of the mechanics and artisans among us. Once each year, when the Mechanics' Institute holds its Fair, these men are able to show the people what they have been doing, and show them, also, what improvements they have made in a twelvemonth. It is something which all citizens should encourage in every way possible, because on such industries as these the permanent prosperity of our city depends.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: Grand Prize, August 2d, \$12,800; Ophir, August 1st, \$6,407; Endowment, August 3d, \$2,590; Northern Belle, July 31st, \$9,272; Arizona, August 1st, \$1,359; Grand Prize, August 5th, \$13,200; Empire, August 2d, \$13,500; Tybe Consolidated, August 2d, \$4,205.64. Total for July, \$79,230. Northern Belle, August 2d, \$8,667.

## Opening Exercises of Twelfth Industrial Exhibition.

According to the published programme, the opening exercises of the present exhibition took place at Baldwin's Theater Tuesday afternoon. The theater was comfortably filled, and some few had the privilege of standing room, the boxes being occupied as well as other parts of the house. It was estimated that about 2,500 were present. Below we give the address of President Huldick, who was listened to with close attention, and his utterance was so distinct as to enable all present to catch every word:

*Ladies, Gentlemen and Members of the Mechanics' Institute.*—We have met here to inaugurate the Twelfth Industrial Exhibition, under the auspices of the Mechanics' Institute, and while we are gathered under the roof of the Industrial Pavilion, the evidence of man's industry and genius, that industry and genius is moving onward in its restless course, and the exhibition is but the taking stock of our industrial affairs at this time in this place.

What criticism of our surroundings of this day could comprehend the whole situation, when there are so many collateral conditions from the outside that can pour on us spontaneously and alter the landscape and every figure in it, or what retrospection can determine with any degree of mathematical certainty or accu-

There is something that strikes me as ludicrous in a man claiming to be an inventor and unit for anything else—a man chasing ideas and shadows, while the substances of life for which he was made, sink before him in the clear stream of economic activity—and dreaming on through life, sustained in the vain hope of revelling in the license (in the language of the times) of a bonanza of invention.

The sooner a man—especially a young man—disabuses himself of that idea and goes to work in the line of legitimate research and individual investigation, the better for him and his fellow men.

And in this he should be encouraged, and facilities for this work should be extended him in every possible way—by free instruction, by lectures, by the brightest and freshest minds; libraries such as the Mechanics' Institute possesses (and which we hope some day to make free); a university such as the State of California can boast of and these Industrial Exhibitions where results are shown in concrete form, and where you will find examples of almost every kind of human ingenuity put in practical form. That little model you may see on the table there, modest and unassuming as its maker, is the result of the most diligent research and careful thoughts of an intelligent mind following a special line of investigation; that piece of silverware, elegantly chased and most beautiful in design, is the result of careful and patient labor and artistic taste, which again are the result of close application to study and instruction. Every article in an industrial exhibition has its moral, but the application of

While the managers endeavor to gather under the vast roof of the exhibition building, the various evidences and samples of the numerous avocations of industrial life, and set before you a good substantial exhibition of the state of the arts on this coast at this day, it is but a proper concession to the cultivated and aesthetic tastes of the numerous visitors, that the substantial food for the minds, should be accompanied by the lighter articles of diet for the senses. Hence we have the fairy-like garden with its grottoes, its flowers and its foliage. The art gallery with a collection of pictures, many of the highest order of merit, and all pleasing; the various fountains spouting streams of clear water, cooling the air by spray and mist therefrom, and the delightful music, led by a master hand, a herald of the evening, delighting the ear and resting the weary brain, and not unmindful of the body's need, when hunger draws one to a savory meal, various refreshments, solid, liquid and gaseous, are supplied by competent and commiserating commissaries.

In the matter of premiums, the Board of Managers have advised with leading exhibitors, and have determined, after due consideration, to award only one grade of first premiums, which premium will be a medal of new design, prepared for this exhibition, or a cash premium which will be paid in sums varying from \$2.50 to \$250.00.

The selection of judges of awards has been a long and difficult work, and the managers have spent a great deal of time and thought in selecting gentlemen who combine competency, integrity and disinterestedness, and who can be induced to serve. This is one of the most embarrassing labors of the Board, and while they believe the names presented will be satisfactory to the exhibitors, the managers will effect changes when they think it desirable, at the request of exhibitors.

All the available exhibiting space is taken and a great many applicants for space have been cut down in the area they desired, and the managers are sorry that they did not build the pavilion by day's work of India rubber, so that it might be expanded; instead of having it constructed by a contractor.

As the commercial importance of San Francisco increases, as its industrial resources are developed and become more varied and diversified, and as its intercourse with other nations will become more extended, the need of permanent exhibition buildings and grounds will be more immediately felt; and as the success of succeeding exhibitions demonstrate the need of such an institution, I am sure that you will join me in hoping that the day is not far distant when, under the auspices of the Mechanics' Institute, an industrial exhibition building with grounds adjacent, will be established here on such a scale as will do credit to this city and the State of California.

As we will have the pleasure of listening to our respected and distinguished fellow citizen, Hon. Horace Davis, who has been chosen to deliver the oration, on behalf of the Board of Managers, I most heartily welcome you to the opening of the Twelfth Industrial Exhibition, held under the auspices of the Mechanics' Institute.

## Art Galleries.

In the older cities of the world collections of paintings and other works of art have been made with great care and expense, and placed in buildings which are open to the public without charge. The influence of such collections on the people at large has been found to be beneficial. They promote a love for the beautiful, and assist in the cultivation of correct taste among those whose station in life precludes the possibility of possessing any art treasures individually.

There are thousands of persons in any large community with latent love for art, who have no opportunity for gratifying their tastes unless those persons whose means permit them to indulge in such things see fit to place their treasures at public disposal occasionally. This may be considered a public duty that the rich man owes society; but, unfortunately, this obligation is not sufficiently well recognized in America. One reason why the Old World excels us in many matters in beauty of design, variety of subject, etc., is that the taste of the artisans has been cultivated by the inspection of works of art and more familiarity with art matters.

The result of such exhibitions is more marked and more widespread than many suppose. It is not only an incentive to painters to excel, but reaches into the various departments of manufacture. It may be recognized in improved architectural designs, varied in character; in ornamentation of iron and wooden structures; and extends from these to the furniture and appliances of dwellings, and the implements in every-day use. In ancient Greece, when a new statue was completed, it was exhibited in the public places, and the occasion made a holiday of by the people. The results of these exhibitions bore fruit among all classes of the people, and the Athenians were renowned everywhere as the most cultivated people in the whole world. They supplied other nations with products unobtainable elsewhere, and their love for the beautiful, studiously cultivated, resulted in immense practical benefit to their nation. Even to this day, the renown of ancient Greece in aesthetic culture still lives among the nations of the world—a result which may be directly traced to a careful cultivation of art.

LEVEE ON YUBA RIVER TO PROTECT FARMING LAND FROM TAILINGS.

racy the future? The experiences of individuals or communities of even the recent past go for but little, for we run into the same follies and repeat the same errors again and again.

The essential progress of the times is made up of trivial improvements in details, which coagulate under the laws of attraction and form the conceivable advance; hence, nothing that is better should be disregarded because insignificant or small, but should be treasured and cared for, as one essential particle of the whole.

All grand ideas and lofty sentiments must have a foundation of truth to build from, so every invention must emanate from invention, and originality goes back to the beginning of things.

But there are periods of time when marked advances seem to be made in some branch of man's industry or human thought. Yet while we speak of Harvey discovering the circulation of the blood in the human system, or Galileo the rotundity of the earth, or Watt the steam engine, or Hargreaves the spinning jenny, or Newton the laws of gravitation, we find that they are the men who, not acting so much from originality of thought as from clearness of perception, blew away the chaff from previous ideas and invention and put in concrete form the spontaneous thoughts of earlier minds in accord with their own, and produced for the world's benefit a condition that could be practically utilized to the wants of man.

Original thought and original invention, like original sin, is hard to fasten on any one man. The difference between thought and invention is, however, that the former must be surrounded by conditions in sympathy with it to be effective, or must be uttered by a bold mind and brave heart, who dares public opinion, while the latter, under almost any circumstances, can be demonstrated to be right or proved to be wrong, and the sooner this is done the better for all concerned.

the whole is, that tangible results of improvement and progress are brought about only by individual sacrifice, by personal investigation and trained thought practically applied.

Considerations of economy, both of time and mental exertion, require that modes of instruction should be reduced to the best form to obtain the highest result with the least sacrifice; and while the aim of public instruction is to bring it to its simplest form and within the capacity of every mind, the bearing that such instruction is to have upon the future avocation of the pupil is rarely considered, hence there is a surplus instruction in many cases and a deficiency in others.

The ambition of parents to have their boys brought up to the profession, has grafted many a withered bud on a promising tree and snipped in the bud many a young genius who would have been more than ordinarily successful in the more modest walks of life.

But in these hard times, empty stomachs and emptier pockets make many a man wish he could shove the plane, lay a brick, or bake a loaf of bread, to keep the wolf from the door of the cabin that shelters his wife and little ones. Within the past year I have had more men than ever before say to me: "If I had only been taught to do some kind of work that I could turn my hand to, I would not be the unfortunate being I am now."

But yet, unfortunate as it is to educate young men for professions already killed to repletion, it is still more unfortunate, it is criminal, to bring up a lad or a girl in idleness. It is the duty of parents to provide that their children should be so educated as to be able to earn their bread, and if parents fail in this particular, I believe it to be the duty of the State; and if these Industrial Exhibitions do ever so little in strengthening the position of industry over the minds of the less thoughtful members of society, they will have accomplished much of their mission.

## Mining Affairs in Idaho.

The Owyhee *Avalanche* says: We have frequently advanced the opinion in these columns that the mines of Idaho Territory are now among the best in the world. With the investment of capital to a reasonable amount and judicious management the correctness of this statement will be made apparent. The rugged character of our mountain country presenting as it does all the external indications of first-class mineral resources, affords abundance of evidence, on a fair trial, that there are magnificent ledges of gold and silver near the surface in every direction. Rich rock is abundant in all our mining districts. The trouble with most prospectors and operators is that they are apt to become discouraged unless they find ore that assays away up into the hundreds. It is well known that in many camps ore that will yield as low as \$10 per ton is worked with profit to all concerned. In this and other sections of Idaho, ore that is worth three, four and five times as much as this is usually cast aside as worthless. If worth less than \$70 or \$80 to the ton the prospector usually abandons his claim under the impression that it will not pay to work the same. If the country around Silver City or Atlanta could possibly have been located near San Francisco we would find that millions of dollars would have been extracted from the earth where only meagre thousands have been taken. Our somewhat isolated position has placed us at a great disadvantage. If experienced men, backed with capital, could come here and see for themselves the extent and volume of these resources, the way would be paved for opening up, by far, the richest mining region on the Pacific coast. Misfortune after misfortune has followed in the wake of past mismanagement.

In this part of the Territory incalculable mischief has been done by sending here, from abroad, so many worthless and incompetent Superintendents to manage the mines. If such a course is persisted in we shall have a repetition of the drawbacks that have resulted so disastrously for us at various times during the past half dozen years. All we ask is a fair and honest development of our mines, and the result will most assuredly be to the advantage of every man who invests a dollar in mining operations in this section of the country. Since the summer season commenced here, and more especially within the past few days, the number of rich claims that have been discovered seems a most marvellous. Prospectors have only to travel a short distance and work a few hours in order to make a rich strike. The discovery of these claims ought to be followed up by energetic labor and the investment of capital. We have all the facilities and conveniences here for carrying on mining operations successfully. Work is not expensive, the climate is comparatively mild, wood is abundant and no inconvenience is experienced from heavy flows of water. There is not to-day a better country in the world for carrying on mining operations than there is right here in Idaho, and the day is not far distant when this Territory will no longer be suffered to remain in the background. There is wealth in abundance here and with energetic men and judicious labor in the process of developing, the country must soon come to the front.

Now that we are in the midst of a season when we ought to be witnessing the progress of active and successful mining operations, it is worthy of note that some of the best and most promising lodes in this country are allowed to remain idle. Conspicuous among the mines in this vicinity that are thus allowed to continue dormant, the Poorman looms up as possessing the best prospects in the entire country. It is a matter of surprise that work has not been resumed on the Poorman long before this. Millions of dollars have been extracted from the ore beds above the seventh level in this mine, and it is the opinion of practical and competent mining men that the indications point to a more promising outlook below that level than has ever been unfolded in this camp at any time previous. Surrounding circumstances, as well as the opinions of practical men, go to confirm this statement. In the vicinity of the Poorman are the rich ledges contiguous to the Empire, Illinois Central, Idlewild and other mines. From the direction of the Belle Peck, in which mine the shaft extends below the present point of operations in the Poorman, there is a rich ore body, which pitches towards the Poorman, leaving no room for doubt as to the existence of a magnificent bonanza below the recent point of operations. There is not an enterprise in this or any other mining district of the Pacific coast that would pay better at the present time than that of sinking in the Poorman. The work can be accomplished at a comparatively trifling cost. The ground is susceptible of being easily worked, and sinking can be accomplished at less than half the expense usually attending such operations in other mines. By sinking a shaft and running levels below in the Poorman, the greatest bonanza ever brought to light in this or any other camp will reward the enterprise and energy of the men who will step to the front and undertake the work. This is no idle supposition, and if the old Poorman company will take advantage of the situation by the investment of a little capital and the sending of such a gentleman here as M. A. Baldwin, Esq., to represent their interests and push forward the work, they will in a few months, at the furthest, find themselves in possession of one of the best paying mines on this coast. No enterprise, under a systematic development, has a more promising outlook,

and Mr. Baldwin, from his past experience in operations on War Eagle mountain, coupled with his knowledge of the fact that a true fissure exists in the Poorman, would be just the man to drive the work forward to a successful termination and secure wealth to the fortunate investors.

## The Ontario Mine.

A correspondent of the Salt Lake *Tribune*, writing from Park City, gives the following description of the Ontario mine: The shaft is now down 100 feet below the 400-ft level. At a depth of 470 feet the ledge was crossed, thus leaving the vein now on the north side of the working shaft. The station has not yet been cut out at the 500-foot level, but in about eight weeks everything will be in readiness to commence sinking the 600-foot.

A small Knowles' pump, lowered down by a windlass, raises the water from the bottom to the tank on the 400-ft station, where a 12-inch Knowles' plunger sends it to the surface. The mine now makes 400 gallons a minute. Should an accident occur to the working pumps, a 10-inch plunger is held in reserve. But, should anything occur to the surface machinery, by which steam could not be supplied the pumps for any length of time, arrangements have been made to hulkhead the water in all the levels at a moment's notice. So closely has this thing been attended to that mud already mixed is placed beside the gates ready to shut the water off tight in a few moments.

As soon as the station at the 500-ft level is completed, a nine-inch plunger, which is now ready, is to be put up, to send the water to the 400-foot tank.

The present shaft is to be sunk to a depth of 600 feet right away. In the meantime work is to be commenced on a new shaft right away. In the meantime work is to be commenced on a new shaft to tap the ledge at a depth of 1,000 feet. The pitch of the ledge is about eight feet in 100. So much for machinery, now for the mine. From the 400-foot station the east level is 700 feet. The west level is 430 feet. That is to say at a depth of 400 feet the ledge is drifted on 1,130 feet in ore, assaying from \$70 to \$200 per ton. There are six stopes started from the east level, not one of which is over 30 feet high. Four hundred feet of the east level never had a pick stuck in it to start a stope. All this, remember, in ore assaying as above. A winze has been started 600 feet from the station to connect with the 300-foot level. On the west level seven stopes have been started, and like those on the east average about 30 feet. The 300-foot level is 1,000 feet on the ledge—600 feet east and 400 feet west of the station.

In the west level six stopes have been started with about 100 feet yet to commence on. In No. 1 shaft, on this level, is about eight feet of clean ore, assaying from \$25 to \$300, and whenever the assays at the mill run low, one man in this stope for a few days can run the battery samples away up. Thus you see that on the 300-foot level we have 1,000 feet of the ledge exposed, with 100-foot block of ground above and the same below to stope out. From the 200-foot level to the surface is nearly worked out, although there is yet ore enough left to make an ordinary individual happy.

The Ontario company has been fortunate, not only in having succeeded by a heavy expenditure in developing the richest mine in the United States but in having in its employ miners. When we say miners, we mean miners, not men who, failing in sheep culture, procure, through cheek or influence, the delightful occupation of squandering other people's money.

**WAKE UP.**—We have recently urged upon all who are interested in the development of the country the importance of "making hay while the sun shines." This section of the country has only been meagerly prospected as yet. Our summers are short and before we are aware of it winter will be upon us again. This city is right in the heart of one of the richest mining districts in the world. There ought not to be an idle man in town at the present time. A little energy in prospecting is certain to open up rich claims, many of which can be found at a distance of a few hundred yards. There is no excuse for any person to remain idle while such an inviting field lies at our very doors. The coming winter will probably be a long and severe one and every person not regularly engaged in some occupation should shoulder his pick now and make a determined effort to solve the grub question and thus help himself out and benefit the country at the same time.—*Owyhee Avalanche*.

**ROBBERS' CLAIM.**—This claim is situated on the Cheyenne river, near Hat creek. It is owned by the "boys" and pans out well. They clean up daily; the last run netted them several thousand, and for a daily clean up it is the best mine in the country. They use flashing powder considerably, and their picks just fit in the pockets of the passengers. Their mining consists principally of dry diggings, and in place of sluice boxes they are furnished by the stage company with treasure boxes, from which they take the gold with powder instead of quicksilver. There are from twelve to sixty now operating on this gulch. On the dump are a number of watches, jewelry, etc. A stampede left here on Saturday evening last, and others have gone down since. They report the prospects for future extremely promising.—*Black Hills Times*.

## The Jicarilla Placers.

This week has been one of considerable excitement in town, owing to the arrival and departure of miners, bound for the new gold fields in the Jicarilla mountains. The richness of these mines has never been questioned by any one who has seen them. No miner, be he sanguine or conservative, has ever prospected in the Jicarilla mountains and said there is no gold, or there is but little gold in them; the reports have been uniformly to the effect that they are very rich. Lack of water has been the great drawback, but the difficulty will be overcome. Parties are going into the mines now who represent sufficient capital to make it a success. The dry washing process has been demonstrated to be a practicable and paying method. But little capital is required in order to procure the necessary machinery and the expenses and profits can be calculated with great certainty beforehand. If this process proves too slow for large companies with abundant money, steps will be taken to bring water into the gold region, either by a ditch or tramway. Either method is feasible.

Here is a country pronounced by the legends of the past and the discoveries of the present to be rich in the precious metals. A vast city was built by the ancient Aztec race near these mines. The ruins of this city still exist and the remains of vast aqueducts for conducting water can be traced for many miles. It was a city supported by the mines and from it the construction of their jewels, ornaments and idols. Whether these legends are true or not, recent explorations indicate that the Aztecs did not exhaust the wealth of this region and that there is sufficient precious metal left to tempt the hardy adventurers.—*Las Vegas Gazette*.

## Cheap Labor in New Mexico.

In New Mexico we have abundance of cheap labor, that which is rarely possessed by new Territories. In most sections which are in process of settlement, laborers for the purpose of doing rough work, building, fencing, digging ditches, mining, freighting, herding sheep and cattle, etc., are not readily secured, and then only at high wages. Here the abolition of peonage threw upon their own resources a large class of people who must make out a subsistence by turning their hand to any kind of work which they can do and at any price they can obtain. They cannot starve and hence must work. They are employed as herders, freighters, miners, and in all the various occupations in a new country requiring rough and unskilled labor. In some occupations in which these laborers have had training they are the best that can be obtained anywhere; in other branches of industry with which they are not so familiar, they are only indifferent workmen. But when they are given employment they are always willing, nay glad to accept it.—*New Mexican*.

**THE LARGEST STATION IN THE WORLD.**—The good city of York, England, says an English exchange, may now boast of having the largest railway station in the world, a hoast which means something in these days of railway extension and architectural improvement. The length of the platform is 1,500 feet, the covered portion of the station 800 feet, the breadth 234 feet and height 50 feet. An idea of its extent may be formed by Londoners or provincials who have passed through the splendid Midland terminus at St. Pancras. The superficial area of the St. Pancras platform is 165,360 feet, and that of the York platform 171,951 feet. It is not a terminal station, but trains will run right through without hacking or shunting. It is situated on a slope rising from the Ouse, and its main entrance looks upon the city walls on the south side through a portico 150 feet by 55 feet.

**NEW REAGENTS FOR FREE MINERAL ACIDS.**—Herr Huber, in the *Pharm. Centralhalle*, translated by the *Polytechnic*, suggests the use of a solution of molybdate of ammonia and ferrocyanide of potassium for the detection of free mineral acids. If a clear yellow solution of these reagents be added to a colorless solution containing salts of alkaline earths with traces of mineral acids (sulphuric, hydrochloric, nitric, phosphoric, arsenic, sulphurous or phosphoric acids), the solution will turn at once to a reddish-yellow color, which approaches more or less to a dark brown as the quality of acid present is greater or less; the turbidity which often occurs in the solution at once disappears in the presence of an excess of alkali. Boracic and arsenous acids give no reaction. These reagents suggested are admirably adapted for volumetrical determination.

**HOT SPRINGS OF OURAY.**—Three miles down from town are the hot springs, which, ere long, will probably be famous, though Ouray has others at town, already utilized for bathing. These park springs deserve special notice. The visitor approaches a large mound, almost grassless, in the center of which is a circular cavity, a score of feet across, while down some six feet lies the steaming surface of the bubbling pool, itself nearly circular and some five or six feet in diameter. A thousand bubbles rise every moment from its clear depth of some dozen feet. The outlet is some twenty feet beyond and below at the foot of the mound where it flows out as a second spring and smaller, and forms a brooklet in which the steaming water gradually cools in outward flow. The pool is so hot for the hand.—*Saguache Chronicle*.

## A VALUABLE MINING BOOK

BY J. S. PHILLIPS.

The Explorers', Miners and Metallurgists' Companion 682 pages, 33 illustrations. Second Edition. A California publication.

## OPINIONS OF THE PRESS.

The book is exactly calculated to suit the views and meet the requirements of those for whom it has been written.—*London Mining Journal*.

The most practical and comprehensive work on mining subjects extant, and valuable book of reference.—*Mining and Scientific Press, San Francisco*.

We know of no work on these subjects in the English language at once so comprehensive, practical and intelligible.—*S. F. Golden Era*.

He has rendered to the leading industry of the coast a valuable service—has furnished the millman and miner a safe and much needed practical guide.—*Overland Monthly*.

This book, which treats in an intelligent and practical way on almost every topic connected with mining pursuits, should be in the hands of every millman, metallurgist, prospector and miner on the Pacific coast. Even the capitalist, and, in fact, every person already engaged in, or likely to become interested in the business of mining, will find in this comprehensive work an amount of information that they cannot afford to dispense with.—*S. F. Commercial Herald*.

This book is free from trash, and solid throughout; all its matter is intelligible to men of ordinary education, and all of it is valuable to miners.—*S. F. Daily Alta*.

In the several sections the work is eminently practical. Is very comprehensive, and contains a great deal of useful information which cannot be obtained from the previous books that have been written on these subjects.—*S. F. Daily Examiner*.

It affords a vast quantity of information as to the appearance and value of different ores.—*S. F. News Letter*.

It is the best single English treatise we know for the use of prospectors and practical miners.—*The Engineering and Mining Journal, New York*.

Sold by Dewey & Co., at this office. Price \$10.50.

## UNITED STATES

## Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Registers' Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, S.

## The Explorers', Miners' and Metallurgists' Companion.

Comprising a Practical Exposition of the Various Departments of Exploration, Mining, Engineering, Assaying, and Metallurgy,

Containing 672 Pages and 83 Engraving

BY J. S. PHILLIPS, M. E.,

Of California, a Practical Operator for Thirty-four Years; Explorer, and Resident in the Pacific States and Territories for the past Eight Years.

PRICED—bound in cloth, \$10.50; in leather, \$12. Forwarded by mail for 50c. extra, at the MINING AND SCIENTIFIC PRESS Office, by DEWEY & CO.

"SPEAKS WELL," ETC.—We would return thanks for an exchange and back numbers of the MINING AND SCIENTIFIC PRESS, published by Dewey & Co., of San Francisco, Cal. It is a well edited, interesting, and valuable journal and speaks well for our Pacific neighbors.—*U. S. Mining and Manufacturing Journal*.

 by Ransom, Sims & Head, Ipswich,  
 England.

One Steam Fire Engine, second-hand,  
 in excellent condition, with 200 feet  
 leather hose, very cheap, just the thing  
 for a small town. Button & Blake,  
 builders, Waterford, N. Y.

One second-hand Stationary Engine, 14x30  
 inches, link motion, with or without  
 hoist gear.

One second-hand Stationary Engine, 8x20  
 inch, with or without hoist gear.

One Upright Boiler, Horizontal Engine  
 on wheels, Eastern make, 7x12.

One Upright Boiler, Horizontal Engine,  
 San Francisco make, 6x12.

One small Stationary Engine, 3½x7 inch.

One Steam Boiler, 40 inches diameter, 16  
 feet long.

One 8x10 Straw-Burning Portable Engine.

One Traction Engine, three wheels, rub-  
 ber tires, double cylinder, 6x10 inch;  
 Thompson's patent, D. D. Williamson,  
 builder, New Jersey.

One Stationary Engine, 10x20, just had a  
 thorough repair, almost as good as new.

One Stationary Engine, new, 12x24, independ-  
 ent cut-off.

One 6x12 Engine and Boiler, can be mounted if  
 required. Very cheap.

Various other second-hand Engines and  
 Boilers for sale cheap.

J. W. RILEY,  
 P. O. Box 2361. San Francisco.

## LIFE INSURANCE CLAIMS.

The Supreme Court of New York State has decided that  
 the law allowing six months over from the date of first  
 publication of Receivership must be complied with, and  
 that it would not be sufficient to file a claim after that  
 time, even if done before the payment of the second divid-  
 end. Therefore, claimants must take prompt action in  
 order to protect their interests, because in some instances  
 the time allowed has nearly expired.

James Munsell, Jr., has established special facilities in  
 the East for presenting in due form and collecting all  
 kinds of claims on policies in Eastern Life Insurance Com-  
 panies in liquidation. It is a matter of great importance  
 that claimants should place their policies only in the  
 hands of persons of experience in the insurance business,  
 in order that their policies may be properly valued and  
 their interests efficiently as well as faithfully represented.  
 Appreciating this fact, several attorneys-at-law in San  
 Francisco and elsewhere have placed the claims of their  
 clients in the hands of this agency for presentation with  
 the Courts and Receivers in Eastern States.

Parties who have only partially filed their claims by cor-  
 respondence with the late Receiver, Grace, who has been  
 superseded, (and the case of Hoyt vs. the Continental En-  
 tirely set aside because illegal), may find it desirable to  
 have their claims presented in due form through this  
 agency with Receiver O'Neill, in the new suit brought by  
 the Attorney-General. Parties filing claims through this  
 agency will be relieved of all further trouble, and final  
 settlement will be made with them at this office on the  
 first, second and third dividends, as fast as made by the  
 Receivers.

For the direction of claimants who are unacquainted  
 with these matters, special reference is made to the Agents  
 and Managers of the principal Life and Fire Insurance  
 Companies in San Francisco. Correspondence from the  
 interior will receive prompt attention.

Office, 224 Sansome Street, corner of California, over  
 the Bank of British Columbia, San Francisco.

N. B.—One of the publishers of this journal has, with  
 confidence, employed Mr. Munsell to collect his claims  
 against the Continental Life Insurance Company of New  
 York.

50 FINE CARDS, Damask, Repp, Etc., with name on  
 13 cents. CLINTON BROS., Clintonville, Conn.

## PACIFIC MACHINERY DEPOT.

H. P. GREGORY & CO.

Cor. California & Market Streets, S. F., Cal.

Importers of and Dealers in

MACHINERY of all Descriptions.

SOLE AGENTS FOR PACIFIC COAST FOR

J. A. Fay & Co.'s Woodworking Machinery,  
 Bement & Sons' Machinists' Tools,  
 Blake's Patent Steam Pumpe,  
 N. Y. Belting & Packing Co.'s Rubber Goode.

## Buy the Best.

Before purchasing an American  
 Watch, examine the different styles  
 manufactured by the NEW YORK  
 WATCH COMPANY, at Springfield,  
 Mass. They are the latest and  
 best improved manufacture. You  
 can depend upon them for fine finish,  
 durability and perfect time. They  
 are sold at favorable prices—in  
 fact, no higher than many of the  
 inferior styles. Examine into the  
 merits of this Watch before you  
 buy any other. Our word for it,  
 you will not regret it.

DEWEY & JORDAN, Agents,  
 433 Montgomery St., S. F.

San Francisco Pioneer Screen Works,

J. W. QUICK, MANUFACTURER,

Several first premiums received  
 for Quartz Mill Screens, and Per-  
 forated Sheet Metals of every  
 description. I would call special  
 attention to my SLOT CUT and  
 SLOT PUNCHED SCREENS,  
 which are attracting much at-  
 tention and giving universal  
 satisfaction. This is the only  
 establishment on the coast de-  
 voted exclusively to the manufac-  
 ture of Screens. Mill owners using Battery Screens exten-  
 sively can contract for large supplies at favorable rates.  
 Orders solicited and promptly attended to.

## CAUTION TO HYDRAULIC MINERS.

All persons, excepting those having the right by pur-  
 chase from me, are hereby cautioned against using, or  
 making, or selling any device for turning the discharge  
 pipes of hydraulic machines which uses the deflecting  
 force of the stream of water.

Any such device is an infringement of United States  
 Letters Patent, granted to me on the 16th of May, 1876,  
 and re-issued September 19th, 1876.

I have commenced suit against Richard Hoskin for in-  
 fringing my said patent, and intend to prosecute all par-  
 ties using such Deflectors without license from me, there  
 being no other way to protect my rights.

Any parties wishing to purchase the right to use this  
 device can do so by making application to me.

HENRY C. PERKINS,

North Bloomfield, Nevada County, Cal.

## BLACK DIAMOND FILE WORKS.

 Sansome St.

Continued from page 85.

pushing developments as rapidly as their means will permit. Messrs. McMillan & Harris shipped last week, to San Francisco, 2,200 pounds of first-class ore, for the purpose of having a thorough test made of its value. The Sherman company have also shipped a lot of their first-class ore to California for reduction. Akin & Co. have struck \$2,000 ore on the Democrat, which is the first North Extension of the Stonewall Jackson mine. The mill at McWilliams is still running with satisfactory results. I visited some time since the Brilliant mine, located about four miles north of McWilliams' camp, and is on the same mineral belt as the Richmond and the Chilson mines. From surface indications, this mine bids fair to rival any in the district. As it is now only partially developed, it shows a five-foot ledge, with from 10 to 15 inches of pay ore, that assays from \$200 to \$250 per ton. Dr. Wilson and John G. Gibbons are still doing work on the Centennial, and have been driven from the third shaft by the water, at a depth of 40 feet. It is not probable that they will be able to proceed without a pump. Take it for all and all the mining outlook is brighter every day. Give us good machinery and practical men to work it and we will astonish the world with our silver product.

## Idaho.

EMPIRE.—Owhee Avalanche, Aug. 4: From recent developments in the fourth level of the Empire it is evident that very satisfactory progress is being made with the work. The rock extracted from the vicinity of that level during the past week has all the characteristics of a permanent and strong ledge. It is solid quartz, liberally streaked with gold.

THE Belle Peck is looking finely and turning out plenty of bonanza quartz.

HENRY MYERS, Esq., is making an effort in San Francisco to have work resumed at South Mountain.

Work is progressing very favorably at the Golden Charlot, and Supp. Denon anticipates the most hopeful results from the sinking operations.

THE Potosi continues to improve as the sinking progresses. The rock taken out is liberally streaked with gold, and it is the opinion of practical miners that the Potosi will in a short time take a position as one of the foremost mines in the camp.

THERE is a general hope that work will soon be resumed in the Footman. If the reports are true that a new company has been recently organized in the interests of this mine, it will be reasonable to expect favorable results from such management as will recognize the vast wealth embodied in this property and the importance of developing it.

## Montana.

NEW MINES.—Helena Independent, July 28: Parties have been for over two years opening a placer on one of the tributaries of the Little Boulder. They began work at a precipitous fall in a canyon of the gulch, in order to get ample dump, and have cut and worked their way through the rocks of the canyon for many hundred feet, and have now reached the broad, smooth bed of the creek, where the ground is easily worked and where the gold lays in chunks. The writer got over \$2.50 to one pan of dirt. The grand clean-up this fall will put several thousand dollars of virgin gold in circulation. For the information of pilgrims and others who wish to prospect for placer mines, I will say that the Big and Little Boulders have probably 50 tributaries or gulches emptying into them, that to all outward appearances are as good as the one in which the rich mine above referred to is located. Very many of these creeks and gulches are still in their virgin purity, their soil never having been pierced by the pick of the miner. Some have been scratched over, and wherever gravel has been up-turned, gold has been found. DEER GULCH.—Half a dozen or more companies are working up Deep, and here are located French, Nixon & Co.'s arastra and quartz mines, the only mines of the kind now being worked in this section. The Lady Nixon and Radical lodes are located near the head of Deep gulch, the one being only six inches and the other 15 inches wide, but the ore is good and is paying an average of \$40 per ton. The ore has been sampled up to \$200 per ton, but it pays better to work it all. The ore has to be packed on mules. The first run this season paid a dividend of \$600, sixth of which went to the credit of W. W. Jones, one of the shareholders. A wagon road will soon be built and a battery added to the arastra. These lodes are paying so well that I wonder other owners of quartz in this district do not work them.

A few claims are running up Little Bear and tributaries, but on the Elk side of the mountains but one white man, John Lawrence, is left. They have sold out to Chinamen.

P. BROGAN's big flume in Elk is running, giving employment to a number of men. Childs & McKint, Flemming, Highland and Grant, in Main creek, Ben Winger and Butler, in Day's, and Turner and Kennedy, in Foot Hills, make up the complement of white mine owners in the district.

The placer interests of Bear and Elk are being whittled down and consolidated to a perceptible extent, and efforts to work the quartz lodes should be made before the placers become exhausted. The miners are generally doing well and wages good, \$5 having been the ruling rate.

At Emmetsburg three or four white companies are working and all doing well, W. H. Smith, Butler, Ferguson & Co. having declared a dividend of \$1,300 to the share.

1. Inches to millimeters.  
 2. Cubic feet to liters.  
 3. Liters to cubic inches.  
 4. Cubic inches to cubic centimeters.  
 5. Hectoliters to wine gallons.  
 6. Wine gallons to liters.  
 7. Liters to fluid ounces.  
 8. Fluid ounces to centiliters.  
 9. Kilograms to avoirdupois pounds.  
 10. Avoirdupois pounds to grams.  
 11. Kilograms to avoirdupois ounces.  
 12. Avoirdupois ounces to grams.  
 13. Kilograms to Troy ounces.  
 14. Troy ounces to grams.  
 15. Grams to grains.  
 16. Grains to grams.

The above table will be found to meet all the requirements of the assayer and chemist. The following example will explain its use. Suppose the capacity of a tank or cistern is found by measurement to be 82 cubic feet, and the number of liters is required. Refer to table No. 2, and find that 8 cubic feet = 226.54 liters. 80 cubic feet will be ten times as much. Therefore:

80 cubic feet =	2265.40 liters.
2 cubic feet =	56.63 liters.
82 cubic feet =	2322.03 liters.

## An Index of Our Manufacturing Status.

In a large city like San Francisco, an exhibition like that of the Mechanics' Institute serves as an index of its manufacturing prosperity, and as this city represents the State in this matter, it also gives an indication of California's manufacturing status.

It is a recognized fact that the true progress of any new country may be measured by the state of its manufacturing and agricultural industries. Among us mining may be added to the list, but a mere exhibition of ores and mineral products can hardly indicate the condition of this latter industry. It is somewhat out of the line of the Mechanics' Fair to make any complete agricultural display, as the State Agricultural Society takes care of this department at their Fair at Sacramento.

It is to the mechanics, therefore, that we look to give us some practical illustration of our manufacturing advancement, so as to illustrate in the best manner, our growth and progress in material resources. The managers of the Institute furnish a fine commodious building with all the conveniences, and gather the citizens daily and nightly to examine what is shown. It only falls on the mechanics and manufacturers to exhibit the results of their handiwork and skill, and give the people an opportunity to examine them in detail.

The managers of the Fair deserve the thanks of the community for affording this opportunity to both the mechanics and the lookers-on, as the impression made by these exhibitions is of great benefit to the city and State. We need never fear that there will be lack of objects of interest to examine. New designs are being constantly made, new inventions brought forward, and new branches of industry inaugurated in our midst. There is no way of bringing these things so prominently before the people better than showing them the practical results accomplished. Men may pass listlessly over any statement of results in figures, but they cannot ignore results when they see before them the articles manufactured, and are able to judge for themselves of the skill of the artisans who made them.

Such practical results exercise an influence, also, on the capitalists in our midst. When they see that others have been successful in their manufacturing undertakings, they are apt to turn their attention in that direction. A multiplication of such industries gives employment to laboring men, helps us to an increase in a steady and desirable class of population, gives an increase in trade, and is advantageous in every way. It is for these reasons that such exhibitions should be fostered by all classes of the community, and every assistance should be given to make them entirely successful.

PROFESSOR RILEY, of the United States Entomological Commission, made a resume of the labors of that body recently in the far-west, dwelling on the Rocky Mountain locust and grasshopper plague. In summing up his observations he says: "There is very little danger of injury from fall swarms of these insects from the northwest, unless they come from the Black Hills country. There remains a chance of swarms from the western parks and plateaus or from those of Utah, but I have good reason for believing that they will prove no more injurious than the swarms which have been passing on for several days, since I have been in the State of Colorado, from western hatching grounds. 'The prevailing wet weather,' he says, 'has destroyed the insects to a great degree, and has been more instrumental than any other cause in destroying the locust.'

J. E. DALEY, a stockbroker, was shot on Montgomery street, this city, on Tuesday, by L. H. Hanks, Consul for Guatemala, Daley dying an hour afterwards. Hanks afterward committed suicide in prison, shooting himself with a musket left carelessly in the corridor.

## General News Items.

SEVERAL incendiary fires are reported in the interior towns.

A DISASTROUS fire occurred at Olympia, W. T., on the 8th inst.

THE Czar has issued a ukase, ordering a levy of 188,600 of the Landwehr.

EX-PRESIDENT GRANT and party arrived at Bellagio, Italy, Sunday.

MAJOR JOHN COOK, a pioneer of Santa Clara valley, died at San Jose Friday.

HEAVY rains fell in Oregon Friday, which it is feared will damage the grain crop of the State.

PHILIP HARTMAN was instantly killed near Tyrone Mills, Sonoma county, Thursday, by a falling tree.

GENERAL SHERMAN says he is much impressed with the value of the country on the Upper Yellowstone.

THE convention between England and Egypt for the suppression of the slave trade has been signed.

SIR JAMES DOUGLAS, founder of Victoria, British Columbia, and the first Governor of the colony, is dead.

JOHN E. DALY was shot in this city, this week, by Leslie C. Hanks, who afterwards committed suicide in the city prison.

EPHRAIM WHITE and George Rugg were arrested at Marysville Friday, charged with robbing the Downieville stage on Tuesday last.

WILLIAM B. OGDEN, who was the first Mayor of Chicago, and the first President of the Union Pacific Railroad Company, died in New York Friday, aged 72.

FURTHER reports of Russian cruelties continue to be circulated. The Bulgarians, excited by the Russian example, are committing the greatest excesses.

PRESIDENT HAYES has issued an order prohibiting the sale of arms or ammunition to Indians, and revoking all licenses to trade with them in such articles.

A large fire occurred on the water front of this city on Wednesday night. An area of over two blocks was burned over, but the loss was only between \$200,000 and \$300,000.

MOSES A. WHEELLOCK, Chairman of the New York Stock Exchange, has failed on his Western Union contracts. Wheelock has been connected with the Exchange for over 30 years, and has been an officer of the Board for 24 years.

A DASTARDLY outrage was committed on Tuesday at the New York Aquarium. Many of the most valuable and rare fishes were poisoned by persons unknown. It is impossible to replace some of the varieties.

A HAVANA letter records a number of disastrous business failures, with increasing commercial and financial trouble. General Jovelar has been relieved from command and General Blanco appointed. He will arrive in a few weeks. Sick and wounded soldiers are constantly arriving, and hospital room is taxed to the utmost.

A GREEN BAY, Wisconsin, special says: The village of Eaton, Brown county, Wisconsin, has been totally destroyed by fire. The forest has been on fire for weeks, the fire extending many miles in every direction, destroying many million feet of timber and thousands of dollars in other property. Some 25 families were burned out in Eaton, losing everything they possessed. One family is said to have perished in the flames, and four other families are missing. Great suffering exists among the homeless people.

## PATENTS AND INVENTIONS.

## A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

[FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.]

By Special Dispatch, Dated Washington, D. C., July 24th, 1877.

WEEK ENDING JULY 17th, 1877.

103,051. WOOD PAVEMENTS.—Henry M. Stow, S. F.  
 103,074. PIPE COUPLING.—Rufus H. Moss, Salem, Oregon.  
 103,182. SAW SET AND FILE GUIDE.—Henry C. Root, Virginia City, Nev.  
 103,291. STREET RAILROAD.—William H. Stow, Chicago, Ill., and Henry M. Stow, S. F., Cal.

REISSUE.

7,794. SELF-DISCHARGING POLYMERIZING BARREL FOR ORES.—Almarin B. Paul, S. F.

TRADE MARKS.

4,847. } REFINED PETROLEUM.—Haas Brothers, S. F.  
 4,848. }

FOR WEEK ENDING JULY 24th.

103,319. FEEDERS FOR THRESHING MACHINES.—Ethelbert J. Clanton, Woodland, Cal.  
 103,331. WOOD-WORKING MACHINES.—Charles J. Hardee, S. F.  
 103,333. HOISTING APPARATUS.—William Hawkins, S. F.  
 103,346. COPYING PRESS.—James A. Powlett, S. F., assignor to J. P. Hopkins.  
 103,372. BRANDING STAMPS FOR MAKING CANDLES.—Isidor Lavenson, S. F.  
 103,375. REFRIGERATING BY MEANS OF AMMONIA.—Robert H. Lucas, S. F.  
 103,378. PORTABLE STEAM BOILERS.—William R. Michener, S. F.  
 103,384. SNOW PLOWS.—George Royal, Truckee, Cal.  
 103,404. COPYING PRESS.—Elias Gill, S. F.  
 103,432. FILTERING AND COOLING APPARATUS.—Josiah W. Webb, S. F.  
 103,457. STAGE SCENERY AND OPERATING MECHANISMS.—Henry F. Parsons, Los Angeles, Cal., assignor to David R. Morse, New York, N. Y.  
 103,402. INDICATORS FOR MINING SHIFTS.—Calvin O. Richardson, S. F.  
 103,483. BLASTING CARTRIDGES.—Prudencio Castellanos, S. F.  
 103,485. DEVICES FOR EXPLODING MINING POWER.—Prudencio Castellanos, S. F.  
 103,489. FIRE ESCAPES.—Ira D. Cross, Reno, Nev.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

PORTABLE BOILER.—Wm. R. Michener, S. F. This invention relates to certain improvements in the construction of boilers, and more especially that class of boilers which are known as portable or field boilers, and which are constructed with a single large flue serving as a fireplace and extending through the length of the boiler, while small return tubes upon each side carry the products of combustion to the chimney. This improvement consists in making the large flue a segment of a circle, and riveting its edges to the lower part of the cylindrical main shell of the boiler, so that at the bottom this main shell serves as a bottom both to the boiler and to the tube. A portion of the main shell is cut away where the fire grates are placed, so as to allow an ash pan to be set beneath the grates; and this ash pan may be surrounded by a water chamber, which connects with the water space in the boiler. A shaft or axle is firmly secured across the end, which is cut away to receive the grates, so as to serve as a stay, and counteract any weakening arising from said cutting away.

WOOD-WORKING MACHINE.—Charles J. Hardee, San Francisco. The object of this wood-working machine is to do that class of work which requires a shifting tool, or, in other words, in which the tool requires frequent adjustment in order to obviate a frequent shifting of the board or other piece of timber to be finished. The machine is especially adapted for doing that class of work which is known among stair-builders as "housing," the same being a groove or grooves in the stringer board, which is secured against the wall alongside of stairs, in which grooves the ends of the risers and threads of stairs are fitted in order to conceal the joint. The machine consists of a swinging frame, which is provided with a track or tracks, upon which a carriage is arranged to travel and be adjusted. This carriage carries the grooving or other cutting tool. It also consists of an improved table for holding the work, which can be adjusted with great nicety to the position of the tool on the carriage. By adjusting the swinging frame and table, the operation can form any desired figure or pattern in grooving, channeling, rabbeting or other similar work. It is a very important tool in doing such work as is necessary in fitting angular and irregular joints.

CANDLE-BRANDING MACHINE.—Isidor Lavenson, San Francisco. This invention relates to an improved machine for imprinting the name of the manufacturer or other brand or mark, upon the candles. The improved machine is so constructed that the operation is rendered quite simple, so that the candles can be handled and branded with great celerity.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

## Iron and Machine Works.

**PACIFIC  
ROLLING MILL COMPANY,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of

**RAILROAD AND OTHER IRON**

**Every Variety of Shafting,**

Embracing ALL SIZES of

Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames,

Hammered Iron of Every Description and Size.

Orders addressed to PACIFIC ROLLING MILL COMPANY, P. O. Box 2032, San Francisco, Cal., will receive prompt attention. OFFICE: 16 First Street.  
The highest price paid for Scrap Iron.

### THE RISDON

**Iron and Locomotive Works,**

INCORPORATED.....APRIL 30, 1863  
CAPITAL.....\$1,000,000.

LOCATION OF WORKS:

Corner of Beale and Howard Streets,

SAN FRANCISCO.

Manufacturers of Steam Engines, Quartz and Flour Mill Machinery, Steam Boilers (Marine, Locomotive and Stationary), Marine Engines (High and Low Pressure). All kinds of light and heavy Castings at lowest prices. Cams and Tappets, with chilled faces, guaranteed 40 per cent. more durable than ordinary iron.

Directors:

Joseph Moore, Jesse Holladay, C. E. McLane,  
Wm. Norris, Wm. H. Taylor, J. B. Haggin,  
James D. Walker.

WM. H. TAYLOR.....President  
JOSEPH MOORE.....Vice-President and Superintendent  
LEWIS R. MEAD.....Secretary

THOS. PENDERGAST.

HENRY S. SMITH

## ÆTNA IRON WORKS,

MANUFACTURERS OF

**IRON CASTINGS**

**and MACHINERY**

OF ALL KINDS.

Fremont Street, Bet. Howard and Folsom

SAN FRANCISCO.

### SHEET IRON PIPE.

**Risdon Iron and Locomotive Works**

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and construct to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle and box—introduced by this company, and guaranteed to outlast any other wheels made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

### SACRAMENTO BOILER WORKS,

37 Fremont St., cor. Mission, S. F.

## HALL & KELSHAW,

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks, Hydraulic Pipe, Oil or Water Tanks, Ore and Water Buckets, Gasometers, Girders, Bridges and Iron Ship Building.

**ALL KINDS OF SHEET IRON WORK.**

Repairing promptly attended to at the lowest possible terms.

### STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

**Miners' Foundry and Machine Works,**

CO-OPERATIVE,

First Street, bet. Howard and Folsom, San Francisco

Machinery and Castings of all kinds.

McAFEE, SPIERS & CO.,

**BOILER MAKERS AND  
GENERAL MACHINISTS,**

Howard between Fremont and Beale Sts., San Francisco

## PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

RANKIN, BRAYTON & CO.,

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, ETC., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster Rock Drills and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

**IMPROVED PORTABLE**

**Hoisting Engines,**

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery.

### PHELPS

**MANUFACTURING COMPANY,**

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle Work, Car Frames and Bolts, Machine Bolts, Set Screws and Tap Bolts, Lag or Coach Screws.

**ALL STYLES OF FANCY HEAD BOLTS.**  
HOT AND COLD PRESSED HEXAGONAL AND SQUARE NUTS, WASHERS, BOLT ENDS, TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,

SAN FRANCISCO, CAL.

**THOMPSON BROTHERS,  
EUREKA FOUNDRY,**  
Light and Heavy Castings of Every Description Manufactured.

Sole Proprietors and Manufacturers of

**Lynch's Ventilating and Illuminating Tile,**  
The Only Illuminating Tile Manufactured for Lighting Cellars, Basements and Dark Rooms which provides proper ventilation for such places.

129 and 131 Beale Street,  
BET. MISSION & HOWARD, SAN FRANCISCO

### CALIFORNIA BRASS FOUNDRY,

No. 125 First Street, Opposite Minna,

SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch.

J. H. WEED.

V. KINGWELL.

### California Machine Works,

119 BEALE STREET, SAN FRANCISCO.

**BIRCH, ARGALL & CO.,**

Builders of QUARTZ, SAW AND FLOUR MILLS,

Keating's Sack Printing Presses,

THE ECONOMY HYDRAULIC HOIST FOR STORES,

And General Machinists.

## Machinery.

### The Ingersoll Rock Drill

Is Extensively Used in the East and

**TAKES THE PLACE OF ALL OTHERS,**

Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other Drill in the market. It has but few parts, is easily handled, being light, and has AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

(Room 10,)

320 Sansome Street

### The Gardner Automatic Safety-Stop Governor.

MORE THAN TEN THOUSAND NOW IN USE.  
EVERY ONE WARRANTED.

SEND FOR DESCRIPTIVE CIRCULAR AND PRICE LIST.

When all others fail, buy a "Gardner." We have all sizes of these celebrated Steam Governors on hand at all times.

BERRY & PLACE,

Selling Agents for the Pacific States,  
Cor. Market & Fremont Sts., S. F.

### THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not more profitable for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

**Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:**

One man.....	\$ 4 00
One man.....	3 00
Wood—24 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2½ cents.....	40 00

Cost of 20 tons.....	\$52 25
Cost of one ton.....	2 61½

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in Peavine District, Nev., and at the Exchequer mill, Alpine Co., Cal. For further information, apply to

D. J. O'HARRA,  
Reno, Nevada.

### BAKER'S ROTARY PRESSURE BLOWER (FORCED BLAST.)

WARRANTED SUPERIOR TO ANY OTHER.

J. C. Sanderling, Sole Ag't Pacific Coast  
51 Fremont Street, S. F.

THE

### LANE & BODLEY COMPANY,

John and Water Sts., Cincinnati, O.,

Sole Manufacturers of

**BRUCKNER'S PATENT**

**REVOLVING FURNACE,**

For Chloridizing, Desulphurizing and Roasting Ores.

—ALSO—

STEAM ENGINES, SAWMILLS, SHAFTING, GEARING AND MINING MACHINERY.

## TULLOCH'S AUTOMATIC ORE FEEDER,

Awarded the Centennial Medal.

The TULLOCH AUTOMATIC ORE FEEDERS have been practically tested during the last year and a half in 40 mills, of from five to 80 stamps each, and have, in every case, given perfect satisfaction. The Tulloch machine is so constructed that the drop of the stamp feeds the ore in just such quantities as the stamps require. Each drop regulates the supply required for the next drop, whether it be more or less, and this is the true principle of an automatic feeder. The tray moves longitudinally, and a stationary scraper forces the material forward at each backward movement of the tray, thus insuring the perfect feeding of all classes of ore, whether it be dry or wet.

We append a few extracts from the many testimonials which we have received from mill men and practical mining men, of the effectiveness and positive action of the Tulloch Feeder. We do not depend solely upon these testimonials, as we are aware that testimonials are easily secured for almost any machine, but the high character of the parties certifying to those herewith given, will establish their value and genuineness.

Mr. Jas. G. Fair has 23 in use; says: I regard them superior to any Feeder with which I am acquainted; I consider no mill perfect without them. Mr. E. R. Burke, Sumner mine, Kern county, has 16: They never get tired; no man living can feed a battery as well; they save us in labor alone \$48 a day. Mr. Green, of the Phoenix mill (12), Anadarko, writes: The first machine we had is working away; is as good as ever; have not spent a dime on it; in use 14 months; you need fear no competition on wet ores. Mr. W. H. Armstrong, of Consolidated Virginia mill: We are running 60 stamps with your Feeders; they give unbounded satisfaction; they have not cost the company one dollar since starting up. Mr. H. C. Bidwell, Supt. Green Mountain and Gold Stripe companies, Plumas county, writes: From the start they have done splendidly; no trouble whatever; requiring but little attention; a boy can manage them; the saving in both labor and castings is fully one-half over the old style of feeding by hand. Mr. Preston writes: I have four of your Automatic Self Feeders, and my mill men each and all say they are the best they have ever used. They are an improvement on all I have ever seen, being simple in construction, and good for either wet or dry crushing; refer to over 40 mills using them; they are guaranteed to give perfect satisfaction. Send for circulars.

F. OGDEN, 413 California Street, S. F.

## Rand's Rock Drill.

Its use in mines brings about

- 1.—Decreased cost of ore.
- 2.—Increased output of ore in a given area of working ground.
- 3.—Decreased number of men employed, consequently saving large permanent investments in houses for men when an increased production is desired.

Testimonials, Circulars and Price Lists, illustrative of the most recent improvements in this class of machines, will be cheerfully furnished on application to the

RAND AND WARING DRILL AND COMPRESSOR COMPANY,

21 Park Row, opposite New Post Office, New York.

# DEWEY & CO'S SCIENTIFIC PRESS Patent Agency.

Office—202 Sansome St., N. E. Cor. Pine, S. F.

PATENTS obtained promptly; Caveats filed expeditiously; Patent re-issues taken out; Assignments made and recorded in legal form; Copies of Patents and Assignments procured; Examinations of Patents made here and at Washington; Examinations made of Assignments recorded in Washington; Examinations ordered and reported by Telegraph; Rejected cases taken up and Patents obtained; Interferences Prosecuted; Opinions rendered regarding the validity of Patents and Assignments; Every legitimate branch of Patent Soliciting Business promptly and thoroughly conducted.

Our intimate knowledge of the various inventions of this coast, and long practice in patent business, enable us to abundantly satisfy our patrons, and our success and business are constantly increasing.

The shrewdest and most experienced inventors are found among our most steadfast friends and patrons, who fully appreciate our advantages in bringing valuable inventions to the notice of the public through the columns of our widely circulated, first-class journals—thereby facilitating their introduction, sale and popularity.

DEWEY & CO., Patent Solicitors.

San Francisco, 1877.

## OUR AGENTS.

Our Friends can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

J. L. THARP—San Francisco.  
B. W. CROWELL—Amador, Placer, Calaveras and Tuolumne counties.  
G. W. McGREW—United States.  
A. C. KNOX—Plumas, Sierra, Lassen, Placer and Nevada counties.  
C. N. WEST—Santa Cruz, Monterey and San Benito counties.  
A. C. CHAMBERLAIN—Tulare, Fresno and Inyo counties.  
A. U. STROCK—Lake, Napa and Solano counties.  
ED. T. PLANK—Dakota Territory (Black Hills).  
JOSEPH DIMICK—Mendocino, Humboldt and Del Norte counties, and Oregon.  
W. D. WHITE—San Bernardino and Los Angeles counties.  
J. W. A. WRIGHT—Sacramento and Placer counties.

## PACIFIC RURAL PRESS.

A first-class 16-page Illustrated Agricultural Weekly, filled with fresh, valuable and interesting reading. Every farmer and ruralist should take it. It is immensely popular. Send for a sample copy.

DEWEY & CO., Publishers, S. F.

EVERY new subscriber who does not receive the paper and every old subscriber not credited on the label within two weeks after paying for this paper, should write personally to the publishers without delay, to secure proper credit. This is necessary to protect us against the acts and mistakes of others.

Any person receiving this paper after giving an order to stop it, may know that such order has failed to reach us, or that the paper is continued inadvertently, and they are earnestly requested to send written notice direct to us. We aim to stop the paper promptly when it is ordered discontinued.

SAMPLE COPIES.—Occasionally we send extra copies of this paper to those we believe would be benefited by subscribing for it themselves, or who are willing to hand the paper and speak of its merits to others. We call the attention of such to our prospectus and terms of subscription.

## 202 Sansome Street.

DEWEY & CO.'S PATENT OFFICES, MINING AND SCIENTIFIC PRESS AND PACIFIC RURAL PRESS newspaper offices, and the SCIENTIFIC PRESS ENGRAVING establishment will be found at the above place, (No. 202 Sansome Street, N. E. Corner of Pine, opposite the Pacific Bank). Just three-fourths of a block south of our old location.

## Scientific and Practical Books on Mining, Metallurgy, Etc.

Published or issued, wholesale and retail, by DEWEY & CO., MINING AND SCIENTIFIC PRESS Office, S. F.

BY GUIDO KUSTEL,  
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quick-silver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why and wherefore. It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus.

It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arseniurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Millman, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

## Designing and Engraving at This Office.

We are prepared to do fine Wood Engraving for illustrating Landscape Scenery, Buildings, Machinery, Works of Art, Manufactured Articles, Trade Marks, Seals, etc. We have a first-class

## Machine for Engraving

A portion of the work, which can be finished thereby more perfectly than by the eye and hand alone. Our patrons can depend upon first-class work always, and at reasonable prices. Samples can be seen at our office.

DEWEY & CO.

SALINAS CITY, CAL., Jan. 23d, 1877.

Messrs. DEWEY & Co.—Gentlemen: I received to-day my patent papers for my improved feed-boxes, which you have so kindly worked through for me, and I wish to add my testimony to that of your many other patrons as to your promptness and fair dealing in every respect. Thanking you for prompt attention to business in my case, I heartily recommend you to those in need of a patent solicitor, in preference to the many Eastern firms who flood this coast with their circulars and representations of cheap fees, etc. Again thanking you, I remain respectfully yours,  
J. O. JOHNSON.

WOODLAND, CAL., Aug. 8th, 1876.

Messrs. DEWEY & Co.—Gents: Your letter containing the patent for my Centennial churn has come duly to hand, and you will please accept my many thanks for the prompt manner in which you attended to the business entrusted to your care, and I will take great pleasure in recommending you to any one having anything to attend to in your line. I am having a number of the churns put up, which will be ready for sale in a few weeks.  
Yours truly,  
JAMES ROOT.

## NOTICE.

To JOHN HOWELL, FRANCIS SMITH and D. B. STANALL—Gentlemen:—You are hereby notified that I have this day revoked the license given to you on the 23d day of August, 1871, authorizing you to erect the White Rotary Furnace in Lander County, Nevada, because of non-compliance with the conditions of said license and agreement, and all your rights and privileges under said license are hereby terminated.  
GEO. W. WHITE.

To THE PUBLIC.—After this date no person has authority to construct or grant to others the right to construct or use a White Rotary Furnace by myself. Neither has any party a right to make or sell any furnace with so-called improvements added thereto.  
GEO. W. WHITE.  
August 10th, 1877.

## The Mariposa Estate.

Work on the tunnel on the Mariposa estate, from which so much was expected, has been stopped, because the suit brought by Joseph A. Donohoe against the company, for foreclosure on account of non-payment of a debt of some \$300,000, unsettled for some years, has resulted in the Mariposa estate or Fromont grant being taken possession of by the authority of the Fourth District Court, in whose custody it will remain pending the legal proceedings. The debt was payable in instalments, only two of which have been paid, and the last one fell due on the 1st inst., but was unpaid. A suit for foreclosure was commenced on the 6th inst., and the property has been taken possession of by the court. According to the Mariposa *Gazette*, an officer of the court was appointed to go there and execute its orders in the premises. The person selected for and charged with this duty was William Thorpe, formerly superintendent of the company. He was, we understand, recommended for the position by the president of the company and the mortgagee, and thereupon appointed and empowered by the court to act as receiver and take charge of the lands, mines, machinery, buildings, etc., for the court, reporting to it and acting under its sole control. The receiver arrived on the 9th, and is now there. Arrangements have been perfected by which the debts of the company, due to the clerks, mechanics, workmen, will be paid in full; also, many debts of the company due to citizens of Mariposa county will be paid without delay. Subsequently to the foreclosure a number of other suits were begun against the company, attachments were issued, and the remaining property has been looted upon and is now in charge of the Sheriff.

The stoppage of work on the tunnel, on which nothing further can be done under the orders of the court, throws out of employment a number of deserving men, who will have to look elsewhere until operations on the new tunnel are again commenced.

## Loss in Transporting Ore.

It is impossible for any one not familiar with mining matters to conceive how difficult it is to obtain all there is in ore, even when the greatest precautions possible are taken. Without referring to the metallurgical operations at all, where the principal loss occurs, the mere handling and transportation of the ore from mine to mill entails a loss in proportion to the richness of the rock. The roads over which the ore is transported in the mining districts contain more or less precious metals, and the dust of the streets would give pretty good assays in gold or silver, as the case may be. Lumps of ore fall from the wagons, are crushed by passing wheels, and scattered about by the horses' feet and the winds, so that in time such thoroughfares accumulate considerable metal.

The sides of the railroad tracks, also, in mining districts, are receptacles for precious metals. Even the dust which blows from such ore as comes from the bonanza occasioned so much waste that it was found advisable to wet the ore down before sending it over the road in the cars. This is now done before the trains leave. Where the ore has to be put through a furnace, however, as at Eureka, it would not pay to wet it, as the moisture, which would have to be expelled in the furnace, would cause more loss in fuel than would be saved by sprinkling. In that camp, also, the loss referred to occurs, and the *Sentinel* states that the Ruby Hill railroad is literally ballasted with silver ore. The daily passage of ore trains over the road and the constant jar scatters a portion of the load out of the cars and alongside of the track for the entire distance. Assays have been made of the earth in several places, and they have run as high as \$50 per ton. The work of gathering it up would cost more than it is worth, and there is no way of stopping the waste. This is one of the sources of loss against which it is difficult to guard, and only shows that the miners have hard work to save what there is in the ore after they find the ore and get it out.

## New Hand-Power Rock Drill.

The accompanying engraving represents a novel method of operating hand drills, invented by A. J. Mershon, of Warsaw, Indiana, which would be found useful in small mines on this coast. The mechanism consists of a strong frame, through boxes in the cross-beams of which the drill slides. One end of a short shaft is journaled into the frame and the other in brackets. On the inner end of the shaft is a disk in which there is an arch-shaped slot. In the slot is journaled a roller which is concave in the direction of its length. An arm projects from a ring which encircles the drill and passes through the slot in the disk. The brackets that support the inner end of the shaft are of such size as to come wholly within the slot, so as to allow of the rotary motion of the arm. A block is secured to the lower cross timber to receive the ring of the arm, at the lower portion of its stroke. The drill point is enlarged and made V-shaped, so that the sharp edges of the V trim the sides of the hole. Two spiral springs are suspended directly under the upper cross-piece. These springs are compressed by a fixed collar on the bar,

Mershon's Hand-Power Rock-Drill.

when the latter is raised. The disk shaft is turned by an ordinary crank, or it may be connected with any convenient motor.

The mode of operation is as follows: As the disk is rotated, the arm is carried upwards by the roller; and as the arm clamps the drill rod on being raised, it carries the latter with it, compressing the springs, and at the same time turning the rod through a part of a revolution. When the roller comes directly over the shaft, the arm is released, and the drill rod and arm fall together. As the ring of the arm strikes the block the drill rod is entirely released, and is thus allowed to make a full blow upon the rock, the effect of which is increased by the expansion of the springs. Each time that the drill is raised, it is automatically turned, so that its cutting edge is constantly being shifted to new points in the rock.

These drills are simple in operation, and being without cog-wheels and gearing are durable and not liable to get out of order. Any miner can see how they could be applied. They are more especially useful in quarries, cuts, etc., but may be used to advantage in sinking small shafts, winzes, etc.

The Belcher company had 226 men on its July pay-roll, and paid out to them a total of \$25,345.50. Of this amount \$5,838 was paid out for account of the Belcher and Crown Point combination shaft, of which the Belcher company pays two-thirds and the Crown Point one-third.

CALIFORNIA produced, in 1876, over 7,500 flasks of quicksilver.

## Bed-Rock Flumes.

Bed-rock flumes are usually expensive undertakings, and seldom commenced unless there is a very good prospect of being repaid. Shafts are sunk and tunnels run on ventures, but bed-rock flumes are designed to tap some known gravel channel which cannot be worked advantageously without one. During the time they are being run, of course, the money all goes out, and there is generally no prospect of getting any back until it is completed. One flume of this kind will often hold up a whole camp or district, while without it there would be no outlet for the gravel, and no work on a large scale could be done. Flumes of this kind are peculiarly Californian, as it is mainly in this State that the auriferous gravel banks occur.

In Montana, however, where a great deal of placer mining has been and is being done, the miners work the ground on the same system as is in vogue here. In Last Chance gulch, an extensive bed-rock flume, which was commenced in June, 1875, is being run. Some 6,000 feet of this flume have been cut, and it is not expected to complete the whole 9,000 feet before the mining season of 1878. Its dimensions are three feet deep and three wide. The lower portion is upon a grade of two and a half inches to the rod, and the upper portion three inches. The head of the flume is about nine feet in the bed-rock, or rather below what was called bed-rock when the gulch was drifted out, but which

Wait's Horse Feeder.

in reality is but a bed of gravel which contains but little gold. It is not improbable, however, that when the bed-rock proper is reached an extremely rich deposit of gold will be found. The work upon this flume has been of the most thorough character, and it is certainly one of the best in the Territory. The editor of the *Helena Independent*, who visited the flume recently when the water had been turned off to admit of some slight repairs to the pavement, had a good opportunity to see how well it did its work. Even with the light grade there was not even an ordinary wagon-load of gravel and boulders in the entire 6,000 feet of its length. The gravel is very heavy and all rock weighing less than 10 or 15 pounds are put through. When completed it will be 9,000 feet in length. The superintendent believes this can be accomplished by the close of the season of 1878. It will open up to mining a space of good ground a mile in length by an average width of half a mile. This ground will give employment to a couple of hundred men for eight or ten years; and the constant employment of this force of men, in addition to those now at work, will be of considerable benefit to the business men of Helena. Mr. Chessman is entitled to a good deal of credit for the enterprise and energy he has shown in undertaking and rushing forward a work that promises to be of so much benefit to the public.

ACCORDING to the *Yolo Mail*, Lloyd Tevis, a large owner in the Southern Pacific railroad, has obtained control of the Vaca Valley railroad.

## The Coming Scientists.

Some of the members of the distinguished party of scientists, who left the East a short time since, and who have been making special scientific studies in the States and Territories east of the mountains, are expected here in a day or two. This party was composed of Sir Joseph D. Hooker and Lieut. Gen'l Richard Strachey, of England; Prof. Asa Gray, of Harvard University; Prof. Joseph Leidy, of Philadelphia; Prof. Hayden, of Washington, and Dr. R. H. Lamborn, of Philadelphia. Mrs. Gray and Mrs. Strachey also accompanied the party. These eminent specialists have made extended examinations and notes in Kansas, Colorado and Wyoming, and are now making examinations in Nevada, from where they will in a day or two start for San Francisco. It is their intention to visit as many important localities in this State as their time will permit. Sir Joseph D. Hooker is one of the most eminent botanists in Europe, and is the Director of the Royal Botanical Gardens at Kew. He is directing special attention to the tree vegetation of this continent, and from his known eminence as a botanist, most valuable information on the important subject of our great forests may be looked for. Dr. Hooker designs making a report on this subject, of which our Government will have the benefit.

Prof. Gray, so well known as our most distinguished American botanist, accompanies the party, and is laboring in conjunction with Dr. Hooker. They have already collected over 600 species of plants, and have noted on the spot all features connected with their growth, locality, geographical distribution, altitude, etc. General Richard Strachey, of the Royal Engineers, has been in charge of the great irrigation works of British India, and has also given much attention and study to the construction of railways in that country, especially the narrow-gauge roads in the Himalaya mountains. General Strachey took the deepest interest in our method of constructing and working railways—pronouncing them most completely successful, and, in many instances, as exhibiting bold and highly skilled engineering. The General evinced much interest in the matter of irrigation in this country, and expressed the belief that the waters of nearly all our great streams could be readily utilized to enrich great tracts of our country, which now lie waste for want of water. Although General Strachey's observations were extensive, as far as he went, it is unfortunate that information, both of a private and official nature, necessitated his return to England from Utah. His recall is much to be regretted, as a wide and important field, both for railway construction and irrigation, is to be found west of the Rocky mountains.

Prof. Gray and Dr. Hooker will continue their labors to this coast. They hope to visit all points of interest in California. The material and information that will be collected, by men of such wide experience and thorough knowledge, will form a most interesting and important report, which will be submitted to our Government through Prof. Hayden's geological survey. Prof. Leidy, of Philadelphia, is investigating the region in the neighborhood of Fort Bridger, which is known to be rich in fossil remains. Prof. Leidy is especially interested in the investigation of microscopic forms, an extensive work on which he is now preparing for publication by the survey under Prof. Hayden.

## Wait's Horse Feeder.

One of the novelties in the fair is a great improvement in the manner of feeding horses in the street. This is Wait's nose bag, out of which we herewith give. It is a canvas bag perforated with holes near the top to give the horse air, and fitting closely around the muzzle by means of an elastic flange. The strap over the head is supplemented by springs so arranged that as the horse eats out the grain, the springs come in play and raise the feed up closer, thereby enabling the animal to eat the last grain out without any of the tossing around incident to the use of other feeding arrangements. The elastic flange prevents his spilling any of his feed, and chopped feed can be fed as well as whole grain. In the pavilion it may be found beyond the carriage department.

## CORRESPONDENCE.

### French Gulch and Deadwood Mines.

EDITORS PRESS:—As I seldom see anything from this section in your paper, I thought a few lines might be of interest, as we have quite a little mining excitement over quartz at the present time, although discovered last fall. Last October, Mr. Balleau, a stranger in this locality, struck very rich quartz on Deadwood, a small stream which heads with French Gulch, in the divide between Trinity river and Clark creek, and empties into Trinity river. It is about six miles from here. Muncy & Balleau prospected during the winter, and with a horse arastra and hand mortar, took out several thousand dollars. Within the past four months many claims have been discovered, and a one-fourth interest in the Muncy & Balleau claim has been sold for \$1,500; and a sale was made last week of "discovery" for \$5,000 cash, and but very little work done on the claim. The ledge is only 15 inches wide, but it is said \$3 per pound has frequently been obtained. There have been five or six claims surveyed with a view of entering. Mr. George Kline struck quartz in connection with placer mining several years ago, and for two years past has been running an arastra whenever he had water, and making from \$250 to \$600 per month. This is, perhaps, two miles from the first Balleau discovery, and is all on the Trinity side of the divide. The prospect has been traced into Sbaasta county. Entirely disconnected with these discoveries, Mr. Kern discovered last fall, in this county, at the head of French Gulch, and not far from the old Sbaa ledge, a very rich ledge. He and Mr. Shea have put up an arastra and have been making from \$700 to \$1,200 per month since. There are several arastras being put up on the Deadwood, and when they are running I expect to hear of good pay being taken out.

The Washington Quartz and Placer Gold and Silver mining company's claim is not to exceed two miles from the Kern & Sbaa mine. The Washington has not been running for several years. A great amount of sulphurets developed in the mine, and the owners could not make it pay. Being poor men, they could not afford to prospect or experiment.

They have a 22-stamp mill, and first commenced operations in 1852. The company have taken out over half a million dollars. If parties having money could be induced to take hold of it, there is no doubt but that it can be made to pay again.

The placer mines in this county are pretty well worked out. Trinity county, however, has much rich ground yet, but lacks water. The past winter they done but little for want of rain. I must close. More anon. W.

### Mono County Mines.

The editor of the *Iuyo Independent* has been at Benton, Mono county, and publishes the following:

Geo. E. Webber, Superintendent of the Comanche mining company, has just returned from San Francisco, where he has purchased a heavy engine, pump and pipes with which to sink the shaft 250 deeper, making a total depth of 1,000 feet. That done, enough ore can be stowed out to keep the mill running steadily for two years thereafter. Owing to the vast quantity of water now coming into the mine, filling it some 40 feet above the 750-foot level, it has been found quite out of the question to keep the mill supplied with ore, though we are told there is an abundance of it, and of the richest quality, in the mine. For some weeks past the mill has been kept running on tailings, which are made to yield about \$16 per ton, therefore a good profit. The batteries were started on ore last Monday, but will probably not find continuous work until the big pump is in operation.

C. H. Aaron, the first to successfully amalgamate Benton ores, has just been placed in charge of the Diana mill. This mill has an abundance of very rich ores on the dump at the mill, and plenty more in sight in the mine, which is down some 500 feet and perfectly dry. As depth was attained in this (the Diana) mine, and also the Kerrick, belonging to the Comanche, the ores grew constantly more and more difficult to amalgamate. Heretofore, on surface ores, the Aaron process was equal to a saving of from 90% to 94%. Toward the last, however, scarcely anything could be saved, so that thousands of dollars were every week run away in the tailings. Mr. Aaron, whose experience and judgment are considered unequalled as regards this particular class of ores, was induced to try his hand as above stated. After three days' run he came to the conclusion that it would be impossible to make a satisfactory success in amalgamating these deep ores without previous roasting, therefore it is very likely milling operations will have to be suspended until a roaster can be built, which, we suppose, will require three or four months' time. With ordinarily successful amalgamating, so rich and plentiful are their ores, this five-stamp mill is expected to turn out well on to \$30,000 in silver bullion per month.

Tregemho & Thomas have been running a drain tunnel into the Yellow Jacket ledge, and

will soon have it completed and re-open the Illinois, a mine which in 1872 produced quantities of ore of extraordinary richness, but upon which no work has been done on account of water, now to be removed by means of this tunnel.

Near this is the Tower mine, belonging to Tregemho and the Hightower estate. This is also considered a first-class mine, but, like the Illinois, so much troubled with water nothing further can be done in getting out ore until drained by pumping, for which purpose heavy steam machinery is now on the ground, and will be put in place as rapidly as possible after the return of Superintendent John Howell, expected from San Francisco early this week.

Albert Mack has been disappointed in his hopes of his mine, the Kearsarge, a supposed extension of his old mine, the Comanche above referred to, and after expending some \$15,000 in prospecting it, thinks he will soon abandon it as a failure.

Eight miles southerly from Benton is an immense ledge, cropping high above ground, of gold quartz, paying from \$12 to \$50 per ton. The leading location on this belongs to Messrs. McNeil, Sbaa & McBride. For some weeks past the two former have been running a horse arastra upon these ores in hopes to obtain a reliable working test of their general value. Their hopes, however, are likely to be disappointed measurably, inasmuch as the sulphurets make perfect amalgamation by this process impossible. At least such were their own anticipations, though they had as yet made no clean-up to fully determine results.

The general confidence in the permanence and undoubted value of the three leading mining properties, to wit, the Diana, Comanche and Yellow Jacket, each comprising two or more opened mines, was never better assured than at this moment; yet, owing to the partial suspension of operations, particularly in hauling ores, for the reasons above given, times in Benton are very much duller than at any time previously for the last two or three years. And it is not unlikely this state of affairs will continue for perhaps three or four months yet, after which we feel assured Benton will enter upon a livelier era than ever before witnessed in all her remarkably prosperous history.

The Mack & Fargo saw mill, a costly and very complete institution, was recently completed, and is now turning out lumber rapidly, as also is that of Hightower & Yaney; so the lumber market will be amply supplied and some to spare. These mills, both located on the Adobe meadow slope, some 18 miles westerly from Benton, supply the entire demand for lumber for the Belleville and Columbus region, embracing an area of say 100 miles to the eastward.

### Transportation of Sulphur.

In our last issue we gave an account of the mining and manufacture of sulphur on this coast. The following in relation to the shipment of this substance is given to the *Commercial News* by Mr. Davidson, agent here for Lloyd's Register of British and foreign shipping: In reference to the letter received from the secretary to Lloyd's, enclosing one dated the 11th of April, from the Australian and New Zealand Underwriters' Association, relating to the damage done by sulphur in the ship *Glen-gairn*, in which vessel sulphur escaped among the cargo, and there being water in the hold "a quantity of iron was mentioned as having been reduced to a heap of mud by the action of the water and sulphur combined," the following remarks are offered for the consideration of the committee:

Sulphur is known to have a very strong affinity for iron under certain favorable circumstances, and this is rapidly promoted by heat. It has been found in the case of piston rods working through vulcanized packing that, after being left in one position for some time, when heated by previous working, the free sulphur contained in the packing has produced a sensible depression in the surface of the piston rod; and in consequence of this, the proportion of sulphur used in the preparation of such packing has been reduced, when employed in the royal navy, to one-half the previous amount.

The actual effect of salt water in promoting the action of sulphur on iron does not, however, appear to have been so generally understood, and we have consequently delayed reporting on this case until some experiments could be made to indicate the nature of the chemical action that takes place under circumstances somewhat similar to those described in the *Glen-gairn*.

Some pure salt water and some sulphur were placed in connection with pieces of iron, and they have been allowed to stand nearly three weeks. On examination it is found there is present some red oxide of iron, or rust, such as would be formed by the salt water and iron alone in combination, and there is also a quantity of black deposit, which might well be likened to mud, as in the letter referred to.

Upon dissolving some of this deposit in hydrochloric acid, offensive fumes of sulphuretted hydrogen were emitted, showing that a chemical compound of sulphur and iron had been formed, or in other words, that the sulphur and salt water combined had produced a chemical effect on the iron and dissolved a portion of it. Other tests were applied showing clearly the presence of iron in chemical form in the deposit referred to.

The iron has not yet been cleaned to ascertain the extent to which it has been eaten away, as it is thought desirable to allow the ex-

periment to proceed for a longer period; but the evidence of the chemical action alone is sufficient to show the importance of guarding against the carriage of sulphur in bulk, especially in iron ships, and it appears to be fortunate that the *Glen-gairn*, in which the circumstances related occurred, was a wood vessel.

### Treating Nickel and Cobalt Ores.

For the treatment of nickel ores, consisting of silicates of nickel and magnesia, containing variable quantities of other substances, more especially the nickel ore of New Caledonia, an improved process has been presented by Mr. E. L. Montefiore, of Paris. The ore, after having been reduced to a fine powder, is attacked by strong sulphuric acid, preferably at 60 degrees Beaume. This can be effected either by solution in the ordinary manner, or by the mixture of the pulverized ore with the requisite quantity of sulphuric acid, according to the composition of the ore, the proportion of acid being such as is sufficient to transform all the nickel and magnesia to the state of sulphates. The mixture being put into heap gets spontaneously heated, or the sort of combustion which takes place can be provoked or hastened by the application of a burning substance; the mass becomes heated and hardened by the transformation of the mass into a mixture of soluble sulphates and anhydrous silica. The soluble sulphates are separated by treatment of the mass with hot water, which then contains the salts of nickel and magnesia and the iron partly in the state of protosulphate. The iron is peroxidized by one of the processes well known, and is then precipitated by carbonate of magnesia, or by one of the known agents, but he prefers the use of a milk of magnesia. The iron may also be peroxidized partially or totally by the calcination of the pulverized ore, either before or after sulphatization, and, if necessary, by the admixture of a proper quantity of nitrate of potash or nitrate of soda.

The solution being separated by decantation, washing and filtration, contains now only salts of nickel and cobalt with magnesia, this solution being heated by steam or otherwise. A sufficient quantity of milk of magnesia (an emulsion of caustic magnesia) is added to precipitate all the nickel, or an excess of magnesia may be used, and after separation of the excess of liquid the precipitate may be treated either with a solution of sulphuric acid, or an excess of a solution of sulphates of nickel and magnesia, which takes up all the excess of magnesia. The colorless liquid is a solution of sulphate of magnesia, which may be concentrated by evaporation, cooled and crystallized for sale. The remaining oxide of nickel is well washed, dried, calcined, and reduced by the ordinary methods used for obtaining metallic nickel from the oxides of that metal.

The solution of soluble sulphates obtained from the ore by the above-named process may be evaporated to dryness, and the residuum calcined, either alone or after mixture with the quantity of salt-peter necessary to convert all the iron to the state of insoluble peroxide, easily to be separated by washing. The solution containing nickel (and cobalt) with magnesia, may either be treated by the methods above described, or may be evaporated to dryness and calcined with mixture of salt-peter of magnesia or of carbonate of magnesia, in quantity sufficient to decompose the sulphate of nickel and reduce it to the state of oxide. The mixture being now washed, the nickel remains in the state of a gray oxide, which may be washed, dried and reduced to the state of metallic nickel by the methods generally employed.

A continuous reduction is preferred by Mr. Montefiore to any other for the reduction of the oxide of nickel to the metallic state. This consists principally of one or several pots or tubes placed vertically, and open at both ends; they are so placed in the furnace as to be easily exposed to the required heat; the upper end of each pot or tube, protruding higher than the top of the furnace, is covered by a movable cover; to the lower part of the earthen tube or pot is adapted an iron tube closed by a sliding door. The oxide to be reduced is introduced by the top into the pot or tube after being mixed with coarsely pulverized charcoal; the reduced metal is withdrawn at the bottom, mixed with the excess of charcoal, a new supply of mixed oxide and charcoal is introduced at the top, and so on continuously. It is evident that the time given for the reduction can be regulated at will by the regulation of the intervals for withdrawing the reduced metal and the quantity withdrawn each time. As the work is continuous, and the pot never allowed to cool, this mode of reduction is very economical.

The essential features of the invention are the treatment of the pulverized ore, calcined or not, by sulphuric acid, and especially the rapid combination, as described, without solution; the separation of iron from its sulphates by magnesia, the separation of nickel from the magnesia in their sulphated solutions by magnesia, thereby obtaining nickel without magnesia, or with but slight traces of this substance, and, on the other hand, sulphate of magnesia exempt from foreign matters; the evaporation to dryness of the solutions of the mixed sulphates, and the separation successively of the iron and nickel by calcination with the mixture of salt-peter for the first-named metal and magnesia for the second, and the use of pots, open at both ends, for the continuous reduction of the oxide of nickel.

### Park City Mines.

A correspondent of the *Salt Lake Tribune* says: A large vein of milling ore has been found near Swift's mill and the Pioneer and Flag-staff mines, which promises, when thoroughly opened, to rival the Ontario and take away the quasi reproach, "Oh, you have only one paying mine in your camp." Too much cannot be said for the Ontario mine and its management. From the beginning, it has had an experienced superintendent, and it is a singular fact that it has not failed to pay since breaking the ground. Most mines show poor and rich spots, but the poorest of this pays something and the richest is marvelous. But the Ontario is not the only mine of the camp by a good many. I am prepared to prove this fact to any one who wants a mine of milling ore.

I can show a ten-foot vein that assays from \$10 to \$110 per ton, nine-tenths silver and one-tenth gold. But little work has been done as yet, but the vein has been traced 4,000 feet. Two spurs have been discovered that make into this vein, 1,000 feet apart, which assay \$36 per ton in the croppings. One has been located by the Swift boys, and they are now opening it. The two others have been located and show good croppings. Several good prospects, with the usual "Fabian policy," are lying idle, waiting to wear out contending owners or hoping to sell without development.

That this camp will be one of the best in the Territory, both in the quality and number of its mines, is a belief shared in by several old miners who have been here a long time. Prospecting is more lively this summer than ever before, and the return of several parties who have been the rounds of the Black Hills, Arizona, Leeds, etc., satisfies our miners to stay at home. The verdict of returned prospectors is that there are more good mines and easier obtained in Utah than any other place they can find. We will give you a good report of the Park and its summer developments before the summer is over.

THE HINDAGO.—Everything is progressing finely at this mine. The miners have been hothered considerably lately by foul air, but having procured a No. 8 Sturtevant blower, and run tin pipes down the incline, now have in the drift a surplus of good air, which every miner knows is an indispensable article. The drift, at the 100-foot level, is now in 140 feet, the last 80 feet being in ore of an average grade. This drift was started with the intention of cutting a cross ledge supposed to be distant 100 feet from the bottom of the incline, but subsequent working proves that the ledge pitches at a sharper angle than was at first surmised, and the drift will probably have to be carried 80 or 100 feet farther before striking the ledge; however, the ore taken from the drift has more than paid expenses since it was started. The winze, sunk 70 feet from the incline, is now down 25 feet. At this point the ledge was only two and one-half feet wide, but has gradually widened, and at the present depth the ledge is seven feet between the walls, most of which is ore of a high grade. Taking everything into consideration, we do not know where a better looking prospect could be found than the Santa Rita company now have in this mine. We predict that, ere many months pass, they will be amply paid for what capital they have expended in Coso district.—*Coso Mining News*.

ANCIENT MINING IN IRELAND.—There is a very interesting article on ancient mining in Ireland in a late number of the *Kilkenny Archaeological Society's Journal*. After speaking of the workings in various parts of Ireland, the writer turns to West Cork. Ancient mine workings have also been discovered in the west of the county of Cork. In 1846, Capt. Thomas, an experienced Cornish miner, while searching for copper on the lands of Derrycarhoon, near Ballydehoh, came on some ancient workings; a neighboring gentleman communicated to the late Mr. John Windele an account of the discovery, in which he states that they were six in number, all parallel bodies; one was about 30 fms. in length, 10 fms. deep, and 10 feet in breadth. They were found filled at the bottom with rubbish, and the top was overgrown with peat, in some places to a depth of 14 feet. A number of stone hammers were found at the bottom of the mine weighing from three to seven pounds, similar to those already described as found in the bottom of the old workings at Killarney; also a curious sort of tub of oak, of a curved form, which was in the Dublin exhibition in 1853, and a ladder of black oak, 18 feet long, formed of a single solid piece, having 14 steps notched in the side. The lands of Derrycarhoon are stated upon competent authority to abound in mineral wealth—the green carbonate of copper occurring near the surface.

MOORE'S FLAT ITEMS.—A correspondent at Moore's Flat sends the *Nevada Transcript* the following interesting items: At the Watt shaft the pump and bolting works are running as smoothly as can be wished for. The cement or lava in the bottom of the shaft continues to be hard. The Blue Banks and Boston mines, on Woolsey's Flat, are running on bottom gravel. The above company expect to make good clean-ups in a short time. The Eagle, Illinois and China companies, on Moore's Flat, are also running on bottom gravel. These mines will pay dividends to stockholders this fall. Cowger, at Snow Point, is working seven men. It is said that he is doing well. The Moore's Flat Blue Gravel company's tunnel is advancing very favorably.

## MECHANICAL PROGRESS.

## How a Brooch is Made.

The jeweler's art is one into which workmen in other crafts get but little insight. We have been interested in reading an article written for the *Polytechnic Review* by Herman T. Wolf, on the practices of the manufacturing of jewelry, and we quote therefrom an account of the steps taken by the workmen to make a brooch, when two pearls and thirty-one diamonds, with necessary tools and materials, are furnished:

The main points to be kept in view are to show off the stones to the best advantage, and, if they are perfect, to have no more gold than is absolutely necessary, so that their effect may not be marred. It will first be necessary for him to make the "settings" for the stones. For this purpose, he works out a piece of gold about three-sixteenths inch high and at the bottom one-sixteenth inch thick. From this he hends the boxes for the pearl and five upper stones. Of these he makes the settings by scalloping them out, first from the top and then from the bottom, and then solders the small frame under them for a finish. (The solder consists of gold of a lower grade, which, melting at a less heat, firmly unites the parts between which it flows.) Having done this, he next makes the "cluster." Into a piece of gold about an inch in diameter, and three-eighths inch thick, he makes holes just so much smaller than the stones as to allow setting. Next the outer edge of the "cluster" is finished like a setting, and scalloped "bizzle" and frame soldered under. Now he makes the mounting for the other diamonds. A frame like the contour is made, which is scalloped, and upon which a thick plate is soldered and into which the diamonds are afterwards carefully mounted. The "knife edge wire" is made from gold bent into the shape of the design and filed sharp at the top. The gold band for the enamel is so arranged that it can be secured after all the rest is finished, in order that the entire work need not go through the enameling fire. The small shot are made by melting particles of gold, which thereby assume a globular form and retain it upon cooling.

And now all is ready for construction. This is done by placing the pieces upon a flat charcoal, applying borax and small pieces of finely cut solder to the places where the pieces are to be joined, and heating them by means of a gas jet and blow pipe till the solder "runs."

After all the soldering has been completed the work is boiled in dilute sulphuric acid, to clean it of oxide and borax, carefully trued with files, all the file-marks removed with a scraper and emery paper, and the task is ready for polishing.

This is done first by means of tripoli and oil, and afterward with rouge and alcohol. By means of gravers, rests for the stones are cut into the settings, and the gold securely pressed over their edges, and the brooch is completed.

In the manufacture of the so-called "Etruscan ware," the delicate wire ornamentations are all bent into shape first and then soldered on the jewelry according to the design. The neat fine-gold-like appearance is produced by immersing the jewelry for a few minutes in a boiling solution of muriatic acid three parts, saltpetre two parts, salt one part. This eats out the alloy and brings the fine gold to the surface. Since it attacks copper more readily than silver, a finer effect is produced by alloying the gold with an excess of copper.

A very praiseworthy attempt has of late been made to reproduce flowers in their natural colors and details; but, due to the amount of labor necessarily expended upon them, they command higher prices than is generally invested by the majority of purchasers. It is sincerely to be wished that they may gain the approval of the public.

By the combination of platinum with red gold for seals, rings, and chains, many novel and very effective designs have been produced. In making plain linked watch chains, the links are wrapped about a mandrel having the exact shape that they are expected to assume. They are then cut apart at one end, hung together, and the joints soldered.

Oxidized silver, so much in vogue a few years ago, is made by treating silver with ammoniac or potassic sulphide.

Enamel is a fusible glass which is melted into cavities in the gold, made by cutting to some little depth with a graver.

Niello, lately fallen almost entirely into disuse, is a black composition of gold, silver, copper and lead heated together, and melted into a design prepared in the same manner as for enamel. The metal is then scraped and burnished, and produces the effect of a drawing in black upon a gold or silver ground.

## Coupling Cars.

The danger and disaster which always attend coupling cars by the existing method has given inventors thought of ways by which the joint could be made without the insertion of the brakeman's body between the moving cars. We read in an English exchange of the following device to meet the need: The object which has been kept in view in this invention has been to save "life" and "time," with as little cost to the owners of trucks, etc., as possible, and the

principle which has been decided upon here is, that the couplings shall remain as they are with the ordinary link or chain, and the latter to be handled from the sides of the cars, so disposing with the necessity of a man passing between the trucks for coupling or uncoupling purposes. To effect this the end link or coupling link of each chain is gripped by a strong steel spring, whose other extremity is fixed to a horizontal bar, held loose by two eyes at each end of the truck. This bar has a curved handle at one of its ends, by means of which the fore-mentioned spring allows itself to be raised or lowered according to requirement; since the end or connecting link is also fastened to the spring, it follows that by turning the handle just named the coupling chain will also be raised or lowered according to the direction in which the handle is turned. Owing, however, to the horizontal bar being also able to move laterally, it follows that by pulling or drawing the bar handle either towards or from you, the end connecting link will be clear of the hook, or in a vertical line with it. Consequently, the left-hand car coupled to the right, supposing it were required to uncouple that car, all that is required would be for the shunter to seize the bar handle and turn it to the right until the end connecting link had been raised above the hook, when he would pull the handle and bar towards him, so as to get the link free of the hook in its downward fall. Having done this, he would let loose the handle, when the coupling chain of the left-hand car would assume a similar position to that of the right-hand car; naturally the converse of these operations would secure the re-coupling of the two cars.

## Rivets or Welds in Boilers.

We have formerly spoken of an investigation in progress as to the value of welded boiler shells. The verdict in the present case is in favor of riveted joints. In his last quarterly report, just issued, Mr. Lavington E. Fletcher, the chief engineer of the Manchester Steam Users' Association, makes the following remarks about welded boilers: One of the explosions referred to in the report sprung from a boiler welded at all the joints instead of being riveted. The association has always regarded welded boilers with suspicion, and, as such boilers are being increasingly introduced for crane and portable purposes, it appeared desirable to call attention to the untrustworthiness of such a mode of construction.

When a boiler is riveted, the strength of the seams can be known with considerable accuracy. The amount of metal lost by the rivet holes can be calculated and allowed for, and what remains, provided that the work be put together with ordinary care, can be trusted. Such, however, is not the case with a welded joint. It is impossible to see into the heart of the weld and to know whether it is sound or not. The parts may be united simply at the surface, skin deep, and no further, and though such joints may withstand the quiet strain of a hydraulic test they may yet fail in actual work. As soon as steam is got up in a boiler, it expands and contracts from alternate heating and cooling, and the flat surfaces breathe in and out according as the pressure falls or rises. This working of the parts soon finds out the weak places, and though a small crack may be all that is started at a weld in the first instance, as the working goes on the crack extends and grows from a small one to a large one till a serious rent results. Welds are, therefore, untrustworthy for those parts of a boiler in which the pressure of the steam acts internally and tends to tear the welds asunder, but welding may be safely adopted for the internal flues on which the pressure of the steam acts externally and tends to keep the parts together. Boilers welded throughout, therefore, are not to be trusted, and the members are recommended to adopt those made with riveted joints instead.

**IRON PAVING.**—By permission of the Commissioners of Sewers of the city of London, a portion of the new wood paving in Beech street has been charged with iron (three cwt. to the square yard) by way of experiment. The object is to increase the durability of wood and preserve and protect it from heavy racking traffic, and to test the practicability of securing small blocks of iron without framework, and so as to deaden the noise and counteract the other disadvantages of metal, as hitherto applied. The ordinary wood paving blocks are beveled by machinery on the upper and lower edges, and between each row is laid a row of cast-iron blocks of double-wedged section thicker at the upper and lower surfaces than in the center, so as to fit mechanically between the beveled wood blocks, which on section are thicker in the center than at the upper and lower surfaces. The iron blocks weigh 16 pounds each, are rounded and serrated on surface for foothold, and perforated for grouting material, and are imbedded in sand on the ordinary concrete bed. The designer and patentee, Mr. Dennison (a London architect), states that the cost, though heavy at first, will not in the long run exceed either granite, wood or asphalt.

**HOOP IRON FOR CEILINGS.**—Mr. R. Leigh, England, has taken out a patent for applying hoops to ceilings. The hoops are used in single lengths reaching between the joists like wooden laths, or they are first formed into squares or sheets, interlocked like wicker-work, or interlaced with wire or other material, and then nailed to the joists. The hoop iron is made of curved sections to increase its strength.

## SCIENTIFIC PROGRESS.

## Electric Sparks as Bedfellows.

**EDITORS PRESS:**—I have several times this summer noticed a phenomenon, new in my experience, no account of which have I ever seen in print. It is the electric spark and light from the cotton sheet and bedspread. When I called attention to it and showed the light to some friends in the evening, my landlady remarked that she had several times been startled by the crackling sounds as the beds were stripped in the "morning making up." She did not know how to account for it. She compared the sound to the hitting together of buttons on a string. But my practiced ear at once detected the electric spark. I first saw the light as I was gathering the sheet about my arms. Shaking and rubbing were tried frequently, but not always producing light. One good experiment is to draw the back of the finger nails quickly along the sheet or spread. Streaks of phosphorescent light follow each finger. The sparkle and light are frequently shown on stripping the spread from the blanket or comfort. It is a well-known fact that dry silks or woollens will sparkle on a dry, frosty night, but it was a new source of amusement to me to see a cotton sheet or spread sparkle like a cat's back. I presume that this effect can be noticed anywhere, away from the coast fogs, whenever the thermometer rises above 90° during the day.—**JEIGH ARRH, Auhurn, Cal.**

## Prize for a New Sugar Extraction Process.

The General Council of Guadeloupe offers a prize of \$20,000 to the inventor of a new process of extraction of juice of sugar cane or of sugar fabrication. This prize will be given to whoever obtains from the cane a yield of 14 per cent. sugar. The cost of application of the new process should not exceed 40 per cent. of the value realized. Experiments will continue four years, terminating June 30th, 1880, and will take place at Guadeloupe under the auspices of a government commission. All cost of transport, etc., must be defrayed by competitors, and applications, etc., must be addressed to the Director of the Interior, Bassé Terre, Guadeloupe. *The Scientific American* says:

"The case filed at Guadeloupe contains 18 per cent. sugar. Hitherto a percentage of 9.4 on an average has been obtained by the ordinary factory machinery. Recently M. Ducharsaing has invented an imbibition process, the details of which are not given in the legislative document before us, but which, it appears, increased the yield from 9.4 to 11.64 per cent. The inventor himself claims a greater advantage, and insists that the additional percentage of gain by his process is 2.33 instead of 1.64. Even on the lower estimate, M. Ducharsaing's invention was deemed sufficiently important to warrant the awarding to him of a \$20,000 prize. The present premium is therefore a second one, and the winner is called upon to make a still further improvement. The experiments must be conducted on at least 660,000 lbs. of cane."

## Something New about Oxygen.

Recent investigations, says the *Journal of Chemistry*, have disclosed the singular fact that oxygen under high pressure rapidly destroys all living beings and organic compounds. All varied phenomena of fermentation, in which the chemical action depends upon the presence of living organisms, are completely arrested by the action of compressed oxygen, even if exerted for only a brief time; while fermentations due to dissolved matter, like diastase, perfectly resist the influence. M. Bert, to whom this curious discovery is due, has found a practical application of it in the field of physiological research. The ripening of fruits is arrested by exposure to compressed oxygen, and hence it must arise from cellular evolution. The poison of the scorpion, on the other hand, whether liquid, or dried and redissolved in water, entirely resists the action of the compressed gas. Such poisons evidently owe their power to chemical compounds akin to the vegetable alkaloids. Fresh vaccine matter, subjected for more than a week to oxygen under a pressure equal to fifty atmospheres, retained its virtue; from which it would appear that the active principle in vaccine matter is not certain living organisms or cells, as some have supposed. The virus of glanders, after similar treatment, quickly infected horses inoculated with it; and carbuncular blood, though freed from bacteria, was found to retain its dangerous properties after the same test. These must, therefore, be put in the same class with vaccine matter. If these results are confirmed by further investigations, the discovery is certainly a most important one, and will lead to the settlement of many disputed questions in physiological chemistry.

**A NEW BAROMETER.**—A sensitive new barometer has been brought before the Physical Society of St. Petersburg by M. Gontkowski. *The English Mechanic* says: In this apparatus a mercury column of invariable height equilibrates almost the whole of the atmospheric pressure, and a column of petroleum oil completes the barometric column. The barometer has at its

upper end an enlargement, in which is fixed, with a plug, another tube 1.40m. in length. The two ends of this latter tube have been closed at the lamp, but a lateral slit is made in the part introduced into the enlargement of the first tube. This slit is covered with bladder skin, previously treated with benzine, and coated with a solution of gelatine in glycerine; it is firmly attached about the tube by its two edges. Thus the ladder forms a partition, at once flexible and impermeable, between the mercury filling the first tube and its enlargement as far as the plug and the petroleum of the second. Experiments have shown that the resistance of this partition to flexure produces a loss of pressure less than 1.60thm. of mercury. The petroleum is 15 times lighter than mercury, and does not emit of vapor of appreciable tension at the ordinary temperature.

## Testing Thermometers.

Those who are familiar with English thermometers know that manufacturers offer for a small advance to furnish an instrument the accuracy of which is verified by the government officer at Kew observatory. At the late meeting of the Royal Society, this officer gave some account of his work. The number of thermometers sent to be tested is increasing, there being now some 3,000 annually. For greater accuracy and for saving time, Mr. Galton devised the present apparatus. The thermometer frame is circular and will hold 40 at a time; the water into which they are placed is in a cylinder of stout copper, two feet two inches high and four feet in diameter, and in the side is a slit one foot ten inches long and four and three-fourths inches wide, which is glazed, and through which the thermometers are read as they are passed round. The cylinder is an outer wooden case, and between the two is a packing of sawdust. The outer case is also provided with a glazed slit to read through. The lid of the case has also a covering of sawdust in kamptulicon. The object of these precautions is to prevent the escape of heat and maintain a fixed temperature during the testing. The regulation of the heating of the water before testing is effected by a connected coil of tubing at the side and a cluster of Bunsen burners. So well does this apparatus act that a long series of experiments made at different temperatures shows a variation of but a part of a degree, which is represented by a figure in the second decimal place. It is still found to be impossible to obviate differences of temperatures at different levels. This, however, is a great improvement on the old method. It takes only about four minutes to read a set.

## Telephonic Improvements.

Prof. Bell, the inventor of the telephone, lately married, and at the wedding reception there was an exhibition of the new invention. He has gone to Europe to experiment with the cables between England, France and Germany, prior to attacking the Atlantic lines.

The latest form of Prof. Bell's telephone, says the *Boston Transcript*, has the whole machine, both for speaking into and hearing out of, reduced to the size and shape of an ordinary door knob. A shiny black piece of thin iron, the size of a three-cent piece, let into the surface of the mahogany knob, is what does the talking. Concealed in the wooden stem of the knob is the magnet, from which proceed the silk-covered wires which carry the *viva voce* message. There are two knobs, so that two may listen to a reply, or a single listener increase the amount of voice heard by holding one of the knobs to each ear. A common electric bell, operated by the same wire, to call, completes the equipment. It is still wonderful, notwithstanding the increasing commonness of the telephone, to hear a superintendent or head of a house in the city making inquiries and giving orders to his foreman out at the mill or factory, 20 miles away, and receiving equally detailed answers and inquiries for instruction in returns, such as could hardly have been transmitted by the "piano-playing" telegraph, so costly in time would conferences of that length have been.

So large has the demand become, that the price for the use of the telephone, which the patentee does not sell, has just gone up from \$10 to \$30 a year. It seems to us, however, that the perfection of this most beautiful and important invention has yet further to go.

**ELECTRIC ILLUMINATION AT SEA.**—The English iron-clad *Alexandra*, supposed to be the finest afloat, has an electric lamp attached to its foremast. The *Polytechnic* says the cost of the lamp and the necessary electric apparatus was £1,000, a sum which seems enormous at first, but does not appear so very extravagant when we reflect that it is supposed to protect a ship the insurance of which amounts to £600,000. The electric light serves two purposes; first, as a beacon light to point out dangerous reefs of rock or sand; and second, as a protection against torpedo boats. The light is thrown out from all sides of the lamp, and illuminates such a large surface of the water that it would be almost impossible for a torpedo boat to approach without detection; especially as the light falling upon the smoke would suffer such refraction as to make the boat's existence even more apparent than if the light had but fallen on its surface. This latter function of the electric light is very important, since ships have heretofore found no protection against the attacks of the torpedo boat.

# MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

### AMADOR.

**ST. LOUIS.**—Amador Ledger, Aug. 11: This quartz ledge is situated at Irish Town, a few miles from Pine Grove, and is owned by A. Vandament and four others. The shaft is 20 feet deep, the ledge showing about 18 inches wide. The last crushing, made in an arrastra some time in the spring, consisted of 20 tons of rock, which yielded \$445, an average of \$22.25 to the ton. There is no water at present, but the claim is being put in order for the resumption of mining operations as soon as water will permit.

**MAHONEY.**—On Tuesday of last week rich rock was struck in the 800-ft level. The specimens are handsomely ornamented with free gold and sulphurets. It appears that pending the decision of the courts as to the future control of the mine, the faction in possession are doing a little in the prospecting line, with encouraging results.

The Amador Con. cleaned up last week, realizing somewhere near \$16,000, rather a small pan-out for the leading mine of Sutter Creek, but still a sum sufficient to leave a considerable margin for a dividend.

This Volcano tunnel undertaking is now in 640 feet. The drilling machinery lately put up is an improvement. It is being compressed air, the motive power being water. It is not yet in position, and it is very doubtful whether there will be sufficient water to enable much to be done before the rainy season.

**TALISMAN.**—Good reports continue to reach us from this mine. A four-foot vein of excellent rock appears in the stopes above the 600-ft level. Workmen are engaged in sinking through new ground, for the purpose of opening up a new level south for air. They are down 70 feet, and the indications are good.

**POTOSI.**—The steam hoisting works are nearly completed. A tunnel has been started from the south side of the hill to intercept a vein lying near the surface. The Potosi is thought by all experienced miners to be a No. 1 mining property, and under the energetic management of John Tregloan it will be worked for all it is worth.

**VOLCANO.**—Beside the Volcano tunnel, the same company are driving another tunnel about one mile below town to prospect a large quartz vein, and are confident that they will strike it rich. Stewart & Co. have struck rich ore in the Confidence mine. Down, of Sutter Creek, is looking after the old Pioneer mine, repairing the shaft preparatory to more extensive operations. Other mines in the vicinity are looking well.

### CALAVERAS.

**UPPER COUNTRY ITEMS.**—Calaveras Chronicle, Aug. 11: Hall's mill is running on Carey rock. The mill—which is a new one lately put up—works splendidly. The Austrian mine, near West Point, has lately been supplied with new hoisting works. The mine looks well. Messrs. Carlton & Ochoa have opened out an old mine near West Point. The mine had been worked in former years, but was abandoned on account of water. The present owners intend putting up new and powerful machinery. Vein, 12 feet wide; rock averages \$100 per ton. Champion sinking and stoping out rock. Golden & Smith have recently struck rich rock in their mine at Summitville. The company own the Good Hope, San Bruno and Vance mines are pushing things ahead vigorously. A tunnel is now being run to intercept a vein lying near the surface. The tunnel, when completed, will tap the latter at a depth of about 500 feet. Potter & Rogers still continue to take out good rock.

### INYO.

**RICH STRIKE.**—Coso Mining News, Aug. 11: Mr. Taylor, Superintendent of the Emigrant mines, Lee district, came recently to this mining. He reports a rich strike in one of their mines. We saw some of the rock, and it is the richest we have seen for many a day—showing gold, sulphurets, native, horn and ruby silver, discernible with the naked eye. As we have to catch the mail to-day we have not the space to say any more than we have, but the specimens can be seen at Dr. Howard's drug store. We are sure all this country will show up well when the mail comes. Taylor also brought in another bar of bullion, of 80 pounds, which is fine indeed. Good.

**COSO CON.**—This mine is looming up. The company have engaged Abe Lida to haul the ore to the Defiance furnaces. He commenced transporting same on last Monday, averaging 25 tons per day. There are yet lots of ore on the dumps at the mine, which will be hauled as fast as possible.

**NEW MINING MANAGER.**—Inyo Independent, Aug. 11: The Rex Montis company have a new Superintendent in charge—Mr. W. J. Spaulding, vice J. H. Holt, Esq. The company propose continuing for the right to retain possession of and work the old Silver Sprout mill, under lease, and propose to put a heavy force on the mine. The Edipse has been bought by the arrival of Prof. W. T. Rickards, Fellow Geological Society of London. He is a man of wide mining experience on this coast, and in fact nearly all over the world. Having thoroughly investigated Ellipse affairs, he has appointed Mr. Nelson as assistant superintendent, and is rapidly putting things in a proper shape for successful work.

### KERN.

**MARBLE.**—Coso Mining News, Aug. 11: There is scarcely a day that passes without the hearing of some excellent new find in this vicinity. Some three months ago it was reported that a discovery of good quality marble had been found in Kern county, and Leland Luce, of the firm of Aitkin & Luce, workers in marble at Sacramento, went to Tehachapi pass, on the Southern Pacific railroad, and in prospecting for marble, accidentally made the find of a ledge of Giallo Antico marble. The above-named marble was wrought, but the quarry lost some five or six hundred years ago, so that now even the location of the quarry is unknown. The marble found by Mr. Luce is identical with that of the Giallo Antico, or so pronounced by an old Italian marble artist of San Francisco, who says he has seen the original worked up into all kinds of designs, but mostly in the manufacture of jewelry; and so valuable had it become because of its rarity that it was worth its weight in gold. The ledge discovered by Mr. Luce is the only one of the kind now in the world. The base of the marble is white, with veins running through it in all directions and shapes free from flint and can be given a perfect surface and polish. By those who have seen it, it is considered the most beautiful marble now worked. The ledge is located in Kern county, California, at a place known as Tehachapi summit, or pass, three miles westerly from the railroad station and one mile from Tehachapi, and is owned by Aitkin & Luce, of Sacramento, who propose to incorporate and supply the world with it. Wherever it is seen it cannot fail to be appreciated.

**NEW ENTERPRISE.**—Nevada Gazette, Aug. 11: A company was incorporated some time since for the purpose of working a body of ground above the claims of the North Bloomfield gravel mining company's grounds, and we learn that operations will be commenced soon. Mr. Derbae is the manager. It is their purpose to consolidate the claims owned by Dick Skidmore, Souchet and others with that owned by the company. There is ground as rich there as that owned by the North Bloomfield company, and as this company have abundant claims, it is no doubt but another extensive mine will be opened, which will help to swell the gold yield of the county. That section of our county is attracting the attention of capitalists at the present time, and all who visit it come away with the conviction that no better field for mining enterprise could be found on the coast.

The South Yuba canal company continues to furnish

water to miners, but it is expected the supply will be cut off soon.

This incline of the Providence is now down 845 feet, and the ledge at the bottom is large and the rock is looking better than ever.

This rock in the bottom of the incline of the New England is looking better than any yet taken out of the mine. The new machinery is all in place now and ready for work.

The new steam hoisting works at the Soggy mine is about completed, and one of the engines was started up and pumping commenced this week.

The Centennial mining company, still running ahead with their tunnel and expect to strike the channel every day. BRADLEY & Co. have commenced work on the old Montana mine, above the Magnolia. As soon as it is pumped dry they will go to sinking and taking out rock.

Smith's mine, at the Half-Mile house, is looming up in the market, and is being taken out that good judges think will yield \$400 a ton.

Forty-eight tons of rock from Johnny Schmidt's ledge, at Wood's ravine, yielded \$2,400. Twenty tons more is being crushed from the same mine and promises even better returns.

SEVEN HUNDRED tons of quartz from the New England has averaged \$30 per ton. A portion of it came from near the top of the ledge, and nearly all from a depth not to exceed 100 feet.

J. F. CARR has commenced work again at the Magnolia mine, at Willow valley. In early times, when worked on the surface, the rock was very rich down to the water level. For want of funds the owners have never gone below that, but on account of low water this year, they hope to get deeper than ever before.

PRINCE is going on at the Georgia gravel mine, near the Sugar Loaf. It is expected to have the shaft clear in a few days, when developments will commence to be made. If success attends this company, there is no doubt about other companies soon starting to work on their claims located on the same channel.

The Deadwood company have let a contract to run their tunnel into the ledge at \$20 a foot.

PRINCE is going on at the Georgia gravel mine, near the Sugar Loaf. It is expected to have the shaft clear in a few days, when developments will commence to be made. If success attends this company, there is no doubt about other companies soon starting to work on their claims located on the same channel.

NEVADA. A Good Ledge.—Nevada Transcript, Aug. 11: Johnny Schmidt's ledge at Wood's ravine, is panning out well. About five weeks ago he had 48 tons crushed, which yielded \$2,400. He has now out on the dump about 20 tons, which will be crushed at Church's quartz mill on Gold Flat. It looks better than the first lot that was taken out. Two men are taking out about four tons of rock per day, the ledge being about four feet thick. It is the cheapest working mine on the coast. The tunnel is run into the hill about 40 feet, and the rock is brought out in cars.

BAN OF GOLD.—We saw at the Citizens' bank, yesterday afternoon, a beautiful bar of gold worth \$2,500. It was the result of 100 tons of quartz taken out of the New England mine. Some of the rock was very poor, and it was crushed with the good, as it came from the mine. This company has taken out about 700 tons of quartz, and it has averaged \$30 per ton. That is what we call pretty good for a mine that has not been worked much for many years, until the New England company got the hold of it. The Idaho mine had declared its 50th dividend of \$5 per share. That mine is a good one, and the most economically, honestly and best managed mine in the State, else it never could have paid so well to the stockholders. There are many mines on this coast that pay better than the Idaho and the expenses ought to be less, and yet they are always assessing them. It makes a big difference when a mine is honest and honest men or rogues.

ALASKA MINES.—Grass Valley Union, Aug. 14: This mine is doing well and has number one prospects of continuing to pay. The underground appearances are good, and the work being done is systematic and after the most approved style of mining. The management, under the superintendence of Mr. M. Dodsworth, is economical and energetic. On the 20th of last month the Alaska paid the dividend of ten cents to a share of the capital stock, and the second dividend of the same amount will be paid on and after the 20th of this month. The Alaska is a new mine and is doing well.

### PLACER.

GOOD YIELD.—Placer Herald, Aug. 11: Some time ago we had brief mention of a new mine being opened near the old Calf Pasture mine, on Rock creek, by Heenan & Mollis. Since then developments have proved it to be a good mine. Last week they had 15 tons crushed at the Evening Star mill, which cleaned up \$49.50, an average of \$33.35 per ton, which is very good. The rock was not selected, but taken as it came out of the mine.

ST. LAWRENCE.—Placer Argus, Aug. 11: Osborne & Pearson have leased the St. Lawrence ledge from F. B. Thomas. It has been closed since the suspension of the Bank of California, W. C. Talston having been the principal owner. The lessees are opening up the shaft with unusually good prospects. It has a 15-stamp mill. The ledge is two feet half, and three feet thick. The rock assays \$10, \$12 and \$16 the ton.

The shutting down of the St. Patrick mine has caused idle miners to go out prospecting, with a strong probability that out of this present evil will come much future good.

## Nevada.

### WASHOE DISTRICT.

CALIFORNIA.—Gold Hill News, Aug. 15: Daily yield, 550 tons of ore, keeping the mills crushing to their full capacities and turning out the usual quantities of bullion for shipment. The ore stopes are looking well and yielding good ore at every point which is being worked from the 1400 down to the 1850-ft levels. Owing to the repairs now going on at the Consolidated shaft, no ore is being hoisted from the 1500-ft level. These repairs will, however, be completed in a day or two more, when the extraction of ore from that portion of the mine will be resumed. The ore stopes on the 1000-ft level, extending south from cross-cut No. 5, are widening out and the ore is of a very rich character. The 1350-ft station, in the C. & C. shaft, is now being cut out and the station timbers put in. The flow of water at the bottom of the shaft is still strong.

MOLAR PANS.—Daily yield, 90 tons of ore, the assay value of which is \$22 per ton. Sinking the combination shaft is going steadily ahead. On Saturday last, this shaft wanted but 40 feet more in depth to carry it, by actual survey, to the level of the Sutro tunnel; by or before the 1st of September it will have passed the point at which the tunnel will strike the shaft. The shaft has been sunk to this depth without the use of a pump, nothing having still in good use. The flow of water at the large iron skeds used for hoisting rock. The flow of water at times has been quite strong, and heavy streaks of clay and soft ground have given much trouble in sinking, but so far all the troubles have been overcome and the work pushed vigorously forward in the most successful manner possible.

CROSS CUT.—Daily yield, 500 tons of ore. The ore stopes on both the 1400 and 1550-ft levels are yielding rich ore and looking finely. The ore stopes going southward on the 1550-ft level are especially fine. The upraise from the 1550-ft level to connect with the winze from the level above is making good progress and is still in rich ore. The double winze on the north line is now 105 feet, the bottom level is good ore. The flow of water at the bottom of the winze is steadily on the increase as the winze approaches the level of the north drift on the 1700-ft level of the Gould & Curry.

BELCHER.—Daily yield, 50 tons of ore, 48 of which is being crushed daily by the mills, and yields an average of \$23 per ton. Repairing the timbers in the perpendicular portions of both the old and drain shaft is being pushed ahead at a rapid rate. At the same time the sinking of

both shafts is being prosecuted with all possible energy. The air and drain shaft is now almost down to the depth of 2,000 feet, which corresponds with the 2000-ft level of the Crown Point. When the old shaft reaches the depth of 2,000 feet, it is the intention to stop its sinking, as the flow of water is strong and the cost of running the two shafts very great. The drain shaft will then become the main prospecting shaft, and the ventilation of the lower levels will be secured by winzes sunk at appropriate intervals below the 1900-ft level. The old incline will reach the 2000-ft level in about four weeks' time. A number of prospecting drifts and cross-cuts are being run on the upper levels, none of which so far show any very encouraging prospects.

JULIA.—The east drift on the 1800-ft level is being pushed vigorously forward, the face in more favorable ground than it has encountered for some time past. Diamond drills are being fitted up for use on the lower levels, as that is deemed a much cheaper method of cross-cutting than the running of long drifts, which require a large supply of fresh air.

JACKSON.—Daily yield, 850 tons of ore. The ore stopes are all looking well, and the yield of ore could be considerably increased were it desirable or necessary to do it. The upraise from the 1,000-ft level still continues in the finest character of ore. As soon as the Silver fill pump is started up, the flow of water will be reduced to the old standard.

ORFAN.—The main south drift on the 1300-ft level is showing some very favorable quartz in the face. Cross-cut No. 2 east, on the 1300-ft level, is being pushed vigorously forward, the face in very lively porphyry, carrying streaks of good looking quartz.

IMPERIAL CON.—The bottom of the winze below the 2200-ft level is still in a fine character of vein matter, carrying live streaks of the Savage, and an able and experienced miner, took charge of the mine as Superintendent, in place of Win. Hardy, who resigned in order to accept the superintendence of the Ophir and Mexican.

GRUB.—The north drift on the 900-ft level is being rapidly advanced, the face in very favorable ground. The south drift on the same level is also being energetically driven forward to connect with the south winze below the 1700-ft level. The east cross-cut from the bottom of the south winze on the 1800-ft level is steadily advancing, the face in favorable ground and showing evident signs of water ahead. This is the point at which an ore strike was recently reported, but had no foundation whatever.

BULLION.—Repairing the main shaft is going rapidly ahead. Since commencing the repairs it has been found that a greater portion of the shaft will need retreating than was supposed when the work was commenced. It is the intention, however, to make a thorough job of it.

SIERRA NEVADA.—The south drift, on the 1700-ft level, is making steady progress without change of value to report. Sinking the winze below the 1450-ft level to connect with south drift, on the 1700-ft level, is going steadily ahead.

ALFA.—The face of the west drift, on the 1050-ft level is showing a mixture of soft porphyry and clay, carrying occasional bunches and streaks of quartz of the most favorable character. The drift is evidently nearing the main vein.

SUCOA.—Sinking the shaft is making favorable progress. The rock in the bottom is quite hard, but blasts out well. The flow of water is much stronger since the stoppage of the Silver Hill pumps.

LADY BRYAN.—Work was resumed in full force and activity at the hoisting works of this mine yesterday morning, the new hoisting engine and other machinery having arrived. This will be placed in working position as fast as possible, the masonry foundations being completed some time since.

YELLOW JACK.—At the 2200-ft level, drifting north, south and east from the winze, is resumed. The main east drift is in 212 feet, and the face is now in a formation of clay seams and quartz. The north and south drifts are in porphyry, with good looking quartz seams. At the new working shaft to the eastward the rock met with is very hard, rendering the progress of sinking slow.

SILVER HILL.—The foundations are being prepared for the reconstruction of the new pump house, and machinery necessary to put the mine in good working order again.

UTAH.—The south drift on the 1150-ft level, running to connect with the north drift from the Sierra Nevada, is making the best of progress, the face in good blasting ground.

CALEDONIA.—The northwest drift on the 1000-ft level is steadily advancing, the face in quartz and ledge matter of a very favorable appearance, showing a lively improvement as the drift advances.

MEXICAN.—The north drift on the 1465-ft level, running to connect with the Sierra Nevada, is being pushed vigorously forward, the face in good blasting ground.

LEVATHAN.—The whole face of the main south drift at the 900-ft level is in good looking quartz, streaks of which show rich ore. The cross-cut below the main north drift at the same level is discontinued and drifting northward in the face of the main drift will be resumed forthwith.

SUTRO TUNNEL.—Face of header in hard andesite, but showing indications of becoming softer. The general formation being passed through at present is of the Comstock character, and it shows more and more so as the great mine workings of the main level are approached.

GOULD & CURRY.—Sinking the main incline is going steadily forward.

SAVAGE.—Last evening the water had been lowered to a point 20 feet below the 1000-ft level. The small pumps are kept lowered to the water level so that, working in conjunction with the Hale & Norcross pump, the body of water is being rapidly reduced.

UNION CON.—The east cross-cut from the bottom of the winze, on the 1400-ft level, is steadily advancing.

SOLD SILVER.—Sinking the winze below the main tunnel or adit is progressing somewhat slowly, owing to the large amount of water coming in.

BEST & BELCHER.—The east cross-cut No. 3, on the 1700-ft level, is being pressed steadily ahead, the face in a very favorable ground, with a strong flow of water coming in.

CROWN POINT.—The drift south from the main east drift, on the 2000-ft level, is steadily advancing, the face in good blasting ground.

HOMESTEAD.—During the first part of the week a strong flow of water was struck in the bottom of the shaft, which has been a temporary suspension of work.

HALE & NORCROSS.—The pumps are steadily gaining on the flow of water.

### BELMONT DISTRICT.

STRICK.—Belmont Courier, Aug. 11: A rich strike has been made in the El Dorado South mine, this week, which will make things lively here for some time before the many months have passed. We were shown some of the rock taken from this strike, which is rich in antimonial silver. While running an upraise from the lower level in the new ground, a clay wall was encountered, and, upon getting through this, a well-defined ledge was struck, which has been stripped for a considerable length and bored into a distance of five feet, all the way in rich rock that will assay from \$300 to \$350 per ton.

### BRISTOL DISTRICT.

WHEELER.—Pioche Record, Aug. 11: From Frank Wheeler, who returned from Bristol on Wednesday, we learn that the winze hoisting works of the Mayflower mine are up and have commenced running, works well and boisterously. The shaft is now down 135 feet; have broken through a boulder at the bottom of the shaft, and have struck ore which assays from \$40 to \$200 per ton. The ore body is increasing in width as depth is obtained; the prospects look better as work progresses. Steady work is kept up on the mine, day and night shifts being run.

### ELY DISTRICT.

RAYMOND & ELY.—Pioche Record, Aug. 11: There are still further improvements in the quantity and quality of the ore on the 1200-ft level as work progresses. The ore stopes on the 1000-ft level are looking very well and turning out well. In the other portions of the mine there is no change to report from our last; they are looking as well as they have previously. The Nevada Central is in good order, making regular trips. The mill continues to run on tallies.

BULLIONVILLE.—The business portion of Bullionville has been looking up considerably of late, owing to the fact of the large number of men employed at the two mills, the furnace and the concentration works. Boarding-houses, restaurants, bar-rooms and other branches of business have been started, all doing a thriving business. The furnace is not yet running; it is being repaired and otherwise repaired while awaiting a supply of coal with which to start. As soon as the coal is on hand it will commence work again, and there will be no more occasion to shut down on that score, as the supply will be kept up constantly.

ELY.—Monday last was pay-day of the Raymond & Ely mine, and, yesterday was the pay-day of the mine of the Alps company, and also the merchandise account of the Raymond & Ely. Over \$40,000 were disbursed. These pay-days have contributed not a little toward infusing new life into the veins and arteries of the town and trade.

### REESE RIVER DISTRICT.

CRESHINN.—Reese River Reville, Aug. 10: The Manhattan mill, after an idleness of 70 days' duration, started up again last evening. The Stedfeldt furnace was fired up this morning. The repairs and alterations which these reduction works have undergone render it one of the finest crushing mills on the Pacific coast. Every important improvement in quartz-milling machinery which could be made available, has been introduced, not the slightest detail being neglected, and no expense has been spared in the endeavor to make the mill as perfect as such an establishment can be made. Barring unforeseen accidents, the mill will now have a long and successful run and do better work than ever; and, even before the start, improvements, it was one of the most efficient mills in the State. It starts up on custom ores, of which there is a large amount on hand, belonging to chlorides and tributaries. We doubt if there is another Co. in the State that could, proportionately, have expended the same amount of money in improvements in mines and mills, as has been laid out for these purposes by the Manhattan Co., without resorting to an assessment on the stockholders, which, as yet, the Manhattan has never levied; and it speaks volumes in praise of the management that all this immense outlay has been made without calling on the stockholders for a dollar. It will be an unprecedented instance of careful and economical mine management, if, after all this great expense, the mines and works are carried on without an assessment being found necessary.

### STAR DISTRICT.

GRIZZLY.—Silver State, Aug. 14: From Peter Organ, who arrived here yesterday from Star, we learn that the Grizzly ledge, recently discovered by the Woolcock boys, is proving to be a valuable mine. At a depth of 20 feet from the surface, they have a well-defined vein, carrying three feet of solid ore, the greater part of which is selected for shipment to San Francisco, where it works from \$400 to \$600 per ton. Wm. Woolcock, one of the owners of this mine, has spent the greater part of his earnings for years, as foreman of the Arizona and other mines, in prospecting, and it affords us pleasure to state that he has at last what he has longed for, and his perseverance entitles him to a good mine.

### TUSCARORA DISTRICT.

DE FREES.—Silver State, Aug. 14: A change has been effected in the management of the De Frees mine at Tuscarora. T. E. Atkinson has been elected Secretary, and G. W. Grayson, of the Grand Prize, takes the place of C. E. Convis on the Board of Directors. The conflict of title between the De Frees and Young America North and Grand Prize has been amicably adjusted, leaving the De Frees title perfect. The changes in the management and the quieting of the title is mainly due to the persistent efforts of M. F. Freeman and Judge Keene, of Elko, two of the principal stockholders.

### WARD DISTRICT.

LOOKING UP.—White Pine News, Aug. 11: From Deputy Assessor George Comins, we learn that the body that assays from \$700 to \$1,000 per ton. This company have for some time been hauling ore to the Eberhardt mill, which it is expected will start up in September and make a run of three months.

### WHITE PINE DISTRICT.

THE TUNNEL.—White Pine News, Aug. 11: The Eberhardt & Aurora tunnel is now in something over 1,500 feet. The formation is still solid limestone, with no change in the last 800 feet. Since the new air-compressor has been put in operation, no more trouble has been experienced on account of ventilation.

RICH ORE.—The Stafford company, on Treasure Hill, has recently come upon an ore body that assays from \$700 to \$1,000 per ton. This company have for some time been hauling ore to the Eberhardt mill, which it is expected will start up in September and make a run of three months.

## Arizona.

PECK DISTRICT.—Cor. Arizona Miner, Aug. 8: There has been no rain in the district yet. The Luke mill in Bradshaw basin has hung up its stamps on account of the dry weather, and the mill has been attached. They have struck a bad strack in the north tunnel of the Peck mine, and a strong flow of water, too.

HUMBURG.—Humburg district lies east of Silver mountain and Castle creek, between Humburg creek, which heads in Bradshaw and the Agua Fria, the source of which is Lynx creek, near Prescott, and it is very undulating in its surface. The Tip Top company has made the most development, having several shafts, 90, 00 and 20 feet or so in depth, and showing plenty of high-grade ore, and were recently offered \$40,000 for the mine. The Cross Cut, near by, has a 45-ft shaft, and looks splendidly. Foy's mine has a 40-ft shaft, with two feet of high-grade ore in the bottom. The Tex, on which Cassy Thompson and others have a lease, has a shaft 20 feet deep, and recently had a batch of ore worked that paid \$370 per ton. Barium & Bronson are working the Basin, and getting rich ore. The Milling mine has just been sold, and is suspended. The vein is large, and shows four inches of \$1,200 ore on the foot-wall. We summoned up our impressions of Humburg district by deciding that it shows more rich minerals for the work done than any district we know of in Arizona.

VALENCIENA.—The Valencierna is well known to all old settlers, having been worked at intervals by different owners since 1848, and yielded thousands of dollars. The gold from it is very pure, worth from \$18 to \$10 per ounce. The owners intend to work arrastras to start on, and hope to get some parties with mills or means to put up a mill at Swilling's ranch, only six miles south of the mines, where there is, even at this dry season, a splendid water-power, to take out 30 tons of ore per day with 15 men, and the 20-stamp mill of the company is being constantly kept in motion. The last

## Dakota.

BLACK HILLS ITEMS.—Deadwood Pioneer, Aug. 3: There are now 20 black hills running in the Hills, and seven more on route between here and Sidney. Fifty tons of the Blacktail ore, crushed in the Pearson mill, the clean-up being made on last Thursday, yielded \$260, about \$13 per ton. The Hidden Treasure is now taking out 30 tons of ore per day with 15 men, and the 20-stamp mill of the company is being constantly kept in motion. The last

### The Big Horn Mine.

A correspondent of the *Salt Lake Tribune*, writing from Camp Stambaugh, July 27th, gives the following opinion of the Big Horn country: This post is located about 100 miles from Green river on the road to the Wind river and Big Horn country, which is believed by many people to contain rich gold diggings. My object in writing this is to inform your readers that if there is any gold here it is yet to be found. I have talked with hundreds of returning prospectors, and they all tell the same story. None of them ever brought back one dollar. I have talked with almost all the old settlers along the road, and have yet to find the first man who says he ever knew of any one finding gold in that country.

### The Big Horn Gold Fields

Are a fraud; there is nothing in it. One and a half miles north of here is the Miners' Delight mining camp. The mine from which the camp derived its name was at one time, some eight or nine years since, considered one of the richest gold mines on the continent. After lying idle all these years, it has passed into the hands of men who mean business. Among them is Colonel Nuckolls, of your city. The company has torn down the old hoisting works, and have just finished new ones, the largest and most complete in the Territory. They also have a ten Cornish pump, which will be lowered today, and he set in motion to-morrow, under the supervision of S. B. Davis, of Salt Lake.

Aside from the above named improvements, this country is away down, without money or enterprise. A few people work placer claims, which pay from \$1 to \$3 per day. Perhaps a few pay more. But I think they all come under the head of China diggings, although there is not a Colossal in the country. You are wearing summer clothes, and I am writing this with an overcoat on.

### The Columbia River Salmon Industry

Not alone with wheat do fleets go laden from this coast. We have other resources, rich and rare; among them is the salmon catching and canning of the Columbia river. Our readers have already had some details of this great industry, but at this time we are enabled to give some little sketches which will, perhaps, impart a better idea to those at a distance, of the means and methods employed. In this effort we shall be greatly aided by an article on the subject which lately appeared in the *West Shore*, a handsome illustrated newspaper, published at Portland, Oregon. From this source we learn that the number of people employed in the different industries of catching and canning, with their attendant arts and ministries, is fully 10,000; and that the value of the produce which will be exported this year will probably reach \$5,000,000. Further comment on the importance of such an industry is not needed.

The first salmon canned on the Pacific coast came from the Sacramento river, and were put up at Washington, opposite the city of Sacramento. The company engaged in it consisted of George and William Hume and Mr. Hapgood. Owing to a lack of experience, the enterprise did not prove a success. Old trappers and hunters had often, within hearing of the Humes', spoken of the wonderfully large and fat fish to be caught in the Columbia river, and at last, in 1865, George started for the then far-off country. On his arrival here he found N. H. Nice and Joachim Reed engaged in fishing extensively, preserving their fish by salting. George secured a location on the river, and the name he then gave it, Eagle Cliff, it retains to this day. After erecting suitable buildings, William Hume and Mr. Hapgood arrived there with the apparatus from the Sacramento river, and the first canning of salmon on the Columbia commenced in 1866, by the firm of Hapgood, Hume & Co. This firm finally dissolved, and each member started a separate cannery. After that nearly every year saw the erection of least one new establishment. Besides the canneries, there are numerous salting establishments along the river, which preserve and export a limited number of salmon every season, salted and packed in barrels. In appearance, all canneries look nearly alike. We show an illustration of one at Upper Astoria, which gives a very correct idea of an establishment of that kind.

The fishing season proper usually lasts from May to August, for a period of about 120 days. The Columbia river salmon, as shown in our engraving, when captured just as they come from the ocean, may be supposed to be exactly ripe, and the peculiar temperature of the water, ice-cold at all seasons, fed by the melted snows of the mountain regions, seems especially adapted to maintain the fish in the best condition.

The fishing boats usually leave at 4 p. m., returning about 4 or 6 the next morning. The fishing is mostly done at night. The salmon knows a net when he sees it, and will avoid it in day time. The boats, as shown in the engraving, are built something like the Whitehall, only much heavier. A boat's crew consists of two men, one for pulling and the other to pay out or take in the net.

The nets are made of Barber's shoe-thread, nine to eleven threads to the strand, and the meshes are eight and a half inches, so that no small fish can be caught. The nets are from 200 to 240 fathoms long (a fathom is six feet), and, floated with corks and weighted with lead, fall as much as 20 feet into the water.

The way the nets are set is to throw one end,

held up by means of buoys, and to row in a straight line across the river, so as to stretch it at right angles with the stream, and then allow it to drift down with the current. The fish, swimming against the stream, are caught in the gills, becoming entangled in the meshes. Just as soon as the fish are caught, if not drowned in the net, they are killed by a blow on the head. The average weight of salmon is 20 pounds. When brought to the cannery the fish are piled upon the wharf, and we have seen 1,500 salmon in a single pile. From this pile they are taken to a trough, thoroughly washed and placed on a long table; here, with a single blow of a huge knife, the headed is severed and with a skillful single motion of a similar knife, the fish is split open and disemboweled. The head and entrails are thrown away at many of the fisheries; at some of them, however, they are made into a very good article of oil. After the fish are cleaned, they are thrown into hline vats, where they remain for a time—this process is known as sliming; they are now taken and placed, one at a time, on a small table with a cutting attachment, and with a single stroke of the lever, the fish is cut into exactly the proper size to fit into the cans.

Another set of hands take these bits of fish, place them deftly in the cans, whence they go to other workmen, whose duty it is, by means of an apparatus, to put in each can a small amount of brine, for canned salmon have nothing else in it, being cooked *au jus*. Now, the cans filled with the raw fish, pass to workmen who apply the lid and solder it on. Next, the cans are placed, hundreds together, in iron rings, or, in some of the canneries, into iron squares, each form holding about 600 cans, and by means of cranes all are lowered into steam boilers, where they are cooked for an hour. Now, quite a nice operation takes place, similar to that employed by the champagne-wine manufacturers, which is called venting. A hole is pricked in the top of the can, and the air and

AT WORK ON THE RIVER.

road continues southeastward to Tashkent in Kokhan, about 800 miles—through swamps and deserts, over mountains and rivers, which require enormous bridging, tunneling, piling, and excavating, and thence eventually into Cashgar, where an intersection is made with the contemplated road from Ormus, in the Gulf of Persia, which, crossing Afghanistan into Cashgar, is aimed toward Peking. The route runs a little north of that originally devised in eastern Europe, and east of that formerly outlined in western Asia.

### THE ENGINEER.

#### New Asiatic Railway.

In the midst of war the Czar finds opportunity to plan for bettering Asia with a railway. The *Railway World* says that he has given formal sanction to the construction of the Central Asian railway which undoubtedly means the immediate commencement and vigorous prosecution of that great work—the full equivalent to our Pacific railway. The Czar would hardly have stepped beyond the duties devolved upon him by the existing war to authorize so great a project unless action was intended; and the reasons which inspire a beginning are potent to require completion.

The road commences at Moscow and is fully completed to Samara on the Volga, through Lower Novogorod, 600 miles. Running south-

eastwardly from Novogorod through Samara it reaches Orenburg on the Ural river, 600 miles, then follows a curve of that river due east to Orsk, which is 150 miles east from Orenburg, 300 south from Ekaterinburg, and 600 from the Caspian by the windings of the Ural. This is the termination of the European and the beginning of the Central Asiatic road, about which so much has been said for a long time.

From Orsk the road continues southeastward to Tashkent in Kokhan, about 800 miles—through swamps and deserts, over mountains and rivers, which require enormous bridging, tunneling, piling, and excavating, and thence eventually into Cashgar, where an intersection is made with the contemplated road from Ormus, in the Gulf of Persia, which, crossing Afghanistan into Cashgar, is aimed toward Peking. The route runs a little north of that originally devised in eastern Europe, and east of that formerly outlined in western Asia.

### A New Kind of Railroad.

The proposed plan for a new kind of railroad is called the "Pioneer Railway," and the *Engineering News* says it consists of a low fence of continuous girder, constructed of wood or iron, as desired, supported on edge upon posts or pillars, and surrounded by a single rail (not a single line of rails); the engine, coaches and cars running on this rail, and sitting astride of the fence, after the fashion of the panniers or packs on a camel or mule. At any incline up to one in ten is possible, in consequence of the method of driving adopted; no expensive surveys are required, nor levels, except of the most simple kind. It is estimated that with the railway made entirely in iron the cost will not exceed \$7,500 per mile, including the proportion of rolling stock. By abandoning entirely the use of vertical adhesion this system is entirely independent of weight, in as far as driving power is concerned, and hence locomotive engines can be made as light as is consistent with obtaining the necessary power from them. The horizontal grip is given by mechanical appliances, which affords the means of varying the amount of pressure at will in proportion to the gradient to be traversed, and therefore to the load to be drawn. A light locomotive engine on this system means a light construction of road, but not necessarily, as in the narrow gauge systems, a seriously diminished proportion of traffic hauled by it. The weight is, as nearly as possible, uniform throughout the train, and amounts, when loaded, to from 15 to 25 cwt. per wheel.

**THE SUBMARINE CABLES OF THE WORLD.**—The *Polytechnic* translates from foreign authorities as follows: There were 206 cables laid, having a total length of 80,000 kilometers, by the end of 1874, and 269 was the number of cables in position in 1876, representing a length of cable equal to 63,989.78 nautical miles. The entire network of submarine cables is owned by 21 private organizations and 17 governments. These 21 private companies own 149 cables or a length of line equal to 59,547.55 nautical miles. The most influential of these companies is the so-called Eastern Telegraph Company, which alone represents 39 cables of a total length of 14,502.75 nautical miles. The next largest is the Anglo-American Company, 17 cables of 12,315.12 miles in length. Of the governmental companies, the Indo-European has six cables of 1,721 miles length, France has 26 cables having a length of 673 miles, Germany 21 cables with 149.25 miles of line. Of the entire number of cables 45, with 20,895.12 miles length, are worked independently by the St. Petersburg Telegraph Company; the others are either entirely or in part worked in accordance with specific contracts made.

**A NEW LIVERPOOL.**—Bristol, England, is to become the rival of Liverpool, if engineering skill and a liberal outlay of money for improvements can do anything in the way of inducing commerce to center there. The river Avon has been deepened, its dangerous angles cut off, and a large dock built at Portishead, at a cost of over \$4,000,000. Another dock for the city has been built at the mouth of the river Avon, a few miles below Bristol, and with its warehouses and plans cost \$3,000,000. These great works are in direct communication with the Great Western and Midland railway systems, and with numerous coasting steam lines running to and from Bristol. The Anchor line of steamers have taken advantage of the opening of the Avonmouth dock to establish a line of passenger and freight steamers between New York and Bristol, and the new route has just been opened by the sailing of the *Olympia* from New York for Bristol.

**ENGINEERING IN INDIA.**—The question of the permanent restoration of a great bridge carrying the Bombay, Baroda and Central India railway over the Nerhudda river, 1,560 feet for which were carried away by heavy floods in September, 1876, has been receiving much consideration; and it has been decided to erect an entirely new bridge just above the old bridge on a design furnished by Sir J. Hawkshaw. A contract has been entered into for the manufacture and delivery in Bombay of the materials for the new bridge, which will consist of 25 spans of 187 feet 6 inches on piers of two large iron cylinders. Until this new bridge over the Nerhudda is available for traffic, trains will continue to pass over the old bridge, crossing the gap by a temporary structure, which has been erected with skill and promptitude by the Bombay, Baroda and Central India Company's engineers.

**IRON AND WOODEN BRIDGES.**—At the Rigollets, a stream connecting lakes Pontchartrain and Borgne, there is a bridge 3,600 feet in length, which has just been rebuilt by the Phoenixville Bridge Company, who are renewing all the larger bridges with iron on wooden foundations. The piles which constitute the foundations are from 80 to 95 feet in length, and are driven from 30 to 40 feet into the earth. They are of yellow pine, and are filled with creosote before being put in place, each one being treated to a dose of 300 gallons, or from two to three gallons to each cubic foot. This process consists of the steaming of the timber under a pressure, after which a vacuum is created and maintained as long as any juices will flow, when the creosote oil is introduced, and a pressure of 150 pounds to the square inch is maintained as long as the timber will continue to absorb the oil. Timber thus treated is believed to be virtually indestructible.

A SALMON CANNERY AT ASTORIA.

gases generated are allowed to escape, when the little venthole is instantly resoldered. A second cooking now takes place, when the culinary portion of the canning is ended. The cans are again taken from the boilers, and are showered with cold water. If the vacuum is perfect and the package sound, the top of the can caves in and assumes a concave form.

**ST. GOTHARD.**—A conference recently held by commissioners representing Germany, Italy,

The authorized plan secures Turkestan and strengthens Russian conquests there, but gains no outlet on, and makes no approach toward, the Pacific. It may be that the original and greater enterprise is left for a pacific day.

**BACKING FOR EADS.**—Gen. Beauregard has written a letter highly commending Capt. Eads and his work on the jetty system at the mouth of the Mississippi. He suggests to all persons interested in having ample water for com-

THE COLUMBIA RIVER SALMON.

and Switzerland, with reference to the present position of the St. Gothard railway (and tunnel) has come to the conclusion that the original plans must be modified and reduced. The St. Gothard railway, properly so called, is proposed to be proceeded with, but sundry affluents are to be abandoned for the present. Notwithstanding this abandonment, additional capital is still required to the extent of £1,840,000.

cial purposes at the mouth of the Mississippi, to bear with patience an occasional *contretemps*, instead of lending a willing ear to all the unfavorable rumors which are set afloat concerning the work. Morally, if not materially, they should encourage the engineer "who has staked his reputation and the means of himself and friends on the accomplishment of an undertaking which is ere long to make of New Orleans the greatest grain shipping port in the world."

## Leeds District.

But slight progress has been made in the development of our mines since my last report. However, all the leading mines mentioned heretofore continue to present their usual fine appearance; and now that the

## Rock Cliff Mill

is completed, and is in successful operation, mine owners are preparing for a largely increased production of ore.

This mill (the Hunter-Goss) is running on Emily Jane and Stormont ores, of which about 20 tons per day is being reduced; and from appearances, the yield of these mines bids fair to monopolize the reducing power of the mill to such an extent that more custom mills will be required to accommodate the yield of other valuable mines.

This mill, 10 stamps, when running at maximum speed, is capable of reducing 50 tons per day, and Mr. Goss assures me that even 60 tons could be disposed of within that time. Twenty-two tons of Stormont ore was passed through the battery yesterday in 11 hours, which I will venture the assertion is, by far, the most rapid work ever attained by a mill of like size.

No bullion shipments have yet been made, but battery samples indicate the ores from the mines mentioned above, to be of the value of about \$140 per ton.

It is confidently believed that the entire reducing cost of these ores, by this mill, will not exceed \$4 per ton, and that 93% of the assay will be realized.

## Bullion Shipments

Per Wells, Fargo & Co., for the month, are a little more than \$40,000, of which \$3,000 is accredited to the Leeds mining company, about \$6,500 to Dupax, \$2,500 to Tischer & Co. and \$1,000 to the Stormont and Emily Jane company.—*Cor. Salt Lake Tribune.*

## Emigrant Gap.

We made a short call at Emigrant Gap on the 29th ult., and were somewhat surprised at seeing the lively manner in which business is being conducted in that little "burg;" and especially when we consider that heretofore the only industries of the Gap were thought to be its extensive forests of timber, which were being rapidly converted into wood, shakes, stave-holds and all kinds of lumber; and as those industries are nearly at a standstill the present year, others have sprung up in the shape of gravel and quartz mining, which bid fair to add fame to the little town among the rocks for years to come. We were made sensible of the fact that gravel mines have been discovered in the vicinity of Emigrant Gap, which are being worked and producing considerable gold, by seeing the miners disposing of their gold dust in lots suitable to make their necessary purchases of provisions, clothing, etc. Those mines as yet are only being worked on a small scale, but as good prospects for extensive hydraulic mines have been discovered in several places, we may expect to hear soon of their being worked in the most improved modern style. The quartz ledges discovered on Saw Mill Flat, south of the Yuha river, and two and one-half miles north of the Gap, are said to be looking splendid. Although some of these locations were made years ago, they have not received any special attention until recently. The Colman Brothers, of Grass Valley, are the owners of some of the principal ledges, and have about 50 men at present in getting out ore and erecting a quartz mill, which will soon be in use crushing the rock. Several other companies are prospecting ledges recently discovered.—*Dutch Flat Forum.*

**SPRING VS. DITCH WATER.**—The spring water heretofore used in the tuyeres at the Consolidated works, from the fact that it is strongly impregnated with limestone, has caused a great deal of trouble, the incrustation forming in the tubes preventing the water from circulating freely, and in consequence the intense heat, where the ends project into the furnace, burns the iron, and, unless quickly removed, the leakage is apt to form "sows," or large masses of chilled iron, deranging the internal processes and reducing the smelting capacity. Colonel Taylor has been experimenting with the water that runs down the canyon, and finds that its exposure to the atmosphere and settling in the reservoir opposite the office, removes a large portion of the foreign substances and renders it much better for use in the works. It is now about a fortnight since water was used from this source, and no trouble with incrustated or burnt tuyeres has been experienced since that time. The water is turned into the reservoir from the ditch and then pumped into a tank above the boilers, from whence it is carried in pipes to the furnaces.—*Eureka Sentinel.*

**BIG GOLD NUGGET.**—Mr. Rufus Snyder informs us that Messrs. Collins, Snyder & Co., operating in French Gulch, Summit county, have found a nugget weighing 22 ozs. 3 dwts., which, at \$16 per oz., a low valuation, is worth \$354.40. This was found in the "Wire Patch." Nuggets worth from \$3 to \$10 are quite common, but this is the largest nugget found for several years. At the last clean-up it was found that the company had made \$60 per day to the hand, and late reports say they are now doing better than before. Col. Fuller's operations are also highly successful, but we are unable to give exact figures.

## USEFUL INFORMATION:

## Notes on Lacquering.

All have admired the beautiful lacquering seen on the wares brought from across the Pacific, but few know how the work is done. The *Hub* has taken pains to gain this information. We read as follows: "Lacquering" is a specialty with the Chinese and Japanese. The latter assert that the art had its origin in 724, and that as early as 1290 it had attained a considerable degree of excellence, and a school was established in this branch of art named after a skillful painter of that age. The clear pure varnish, which forms so important a material in the work, is obtained largely from the gum of the tree *Rhus vernicifera*, a native of Japan and Nepal. The juice, flowing from the tree when wounded, becomes thick and black by exposure, yet continues so transparent that the finest tracery is visible through it.

In beginning a decoration in lacquer, the first step taken by the Japanese is to trace out, on the thinnest of paper, the required pattern or design, and the tracing is then gone over with a bamboo spatula. The outline thus left is now gone over with a particular kind of soft lacquer varnish. When this is done in hot weather, the varnish speedily dries, and, consequently, where the pattern is a good deal involved, a small portion only is executed at one time, and the gold powder, which enters largely into the lacquer-ware for the foreign market, is applied to each part as it is being executed, a large and very soft brush being used, and by its aid the gold powder is well rubbed in with the lacquer or varnish. The work is then left to dry for about 24 hours, after which the pattern is lightly rubbed over with charcoal made from a particular kind of wood, and this process produces evenness of surface. The work is next rubbed with polishing powder and afterwards carefully wiped. The outlining being done, there still remains a good deal of finishing work, such as tracing the leaves of trees, the petals of flowers, the wings of birds, etc. Into all this gold powder largely enters, the working in of which requires a light and skillful hand. The Chinese appear to work differently. The varnish they use is made from the sap or gum of a native tree which is dark-colored like molasses. Oils are mixed with this which give it fluidity and a lighter color, but it is considerably thicker than our varnish, and can only be applied with a swab of tow. It has a poisonous effect on foreigners, causing something like our lead colic. The health of the native does not suffer, however, except when it is spattered on his lips or in his eyes. It must only be applied in damp weather, and cannot be used in this country.

Another of the Chinese lacquers is made as follows: Take two parts of gum copal and one of shellac; melt them together until entirely fluid; add two parts of hot boiled oil, and when all these are well incorporated, the vessel must be taken from the fire, and 10 parts of oil of turpentine be added, stirring it in gradually. A little dragon's-blood will give it a red tint, or a little gum gutta will tinge it yellow. All the lacquered work of China and Japan is polished, and Americans have no idea of the great amount of labor expended upon this process. Luckily (?) in that country labor is very cheap. In America we could not afford to do such lacquered work, even if we knew how.

**UPHOLSTERING OLD CANE CHAIRS.**—When the cane seat of a chair is broken, it may be made as good as new, or better, by upholstering it at home. As described by the *Journal of Chemistry*, after removing the superfluous bits of cane, cover the space with matting formed of three-inch-wide canvas helting woven together. Tack it temporarily in places. After placing over this some coarse muslin, draw both smooth, and secure at the edge with twine, making use of the perforations. Remove the tacks, turn the raw edge over toward the center, and baste it down. Arrange the curled hair and wool, or whatever you propose to use for stuffing, and keep it in position by basting over it a piece of muslin. Then carefully fit the rep, pin it in different places until you are certain it is in perfect shape, and tack it permanently—following, of course, the tracing made for the cane. Cover the edge with galloon to match the rep, using tiny ornamental tacks, and tie with an upholsterer's needle in as many places as is desirable, leaving a button on the upper side. When the back of the chair is to be repaired, a facing must be tacked on the outside.

**DESIRABLE TIMBER.**—Greenheart, a variety of timber that grows largely in British Guiana, is a hard, close-grained wood, containing a considerable amount of oil, like teak. Its specific gravity is about equal to that of oak, but it is decidedly superior to it in strength, toughness and durability. These, however, are not its chief advantages, its great value consisting in its complete exemption from the attacks of marine worms. It is, therefore, an excellent timber for sluice gates, piles, and all marine engineering works, which would be exposed to their ravages. British Guiana also furnishes morra. This tree grows to a very great size, often attaining a height of 100 to 150 feet, the lowest branches being 60 feet from the ground. The wood is extremely tough and close grained, which properties make it difficult to split, and render it peculiarly applicable to ship building purposes. It is also little subject to dry rot.

**CORIAN PAPER.**—Corian paper, says the *Paper-Trade Journal*, is made of the bark of the mulberry tree, and is used by the wealthier classes in Manchuria and North China instead of glass for covering windows, for making umbrellas, etc. It resembles Japan paper. Its great strength and imperviousness to damp and the size of the sheets are worthy of special notice. Indeed, it is well known that the making of paper is one of the chief industries of the still isolated kingdom of Corea. It finds its way into China through the three annual fairs which are held near the boundary between the two countries. The strength of Corian paper is owing to the fact that the material is not weakened by being subjected to the action of lime for the purpose of whitening it. The paper which the Coreans use for dispatch writing it resembles in strength and color, but it is often thicker and it is polished on both sides.

**OXIDIZED SILVER.**—The color of so-called oxidized silver, says the *Mining Journal*, does not depend on oxidation, but on sulphurization. The silver goods are dipped into a boiling hot solution of calcium sulphide or hyposulphite of soda, or into ammonium sulphide, until they have taken the proper color. "Old silver" is a coloration produced by laying on a mixture of black lead and oil of turpentine, or some fatty matter, and cleaning off with blotting paper until no more color comes away. Copper acquires a handsome look if treated in the same manner. If it is desired to varnish oxidized silver, take 18 parts alcohol, three red arsenic, and one castor oil, and a non-transparent varnish can be made, which may be diluted with its own volume of alcohol, if a particularly thin coating is wished.

**IMITATION NICKEL PLATING.**—As nickelizing is replacing silvering in some cases, so there are some where nickelizing may be itself replaced for many articles of small value, such as pins, particularly if they contain copper. The manipulation is very simple. Coarse rasped or granulated zinc is boiled for some time in a mixture of three parts by weight of sal-ammoniac and ten of water; the objects are immersed and stirred with a zinc rod. The deposit is silvery bright, and resists mechanical action as well as a coating of nickel. The process can be recommended for goods which are meant for a second coating of some other metal, since any other is easily deposited upon zinc.

**SAVING HEAT.**—A composition of very thin flour paste, thickened with clean sawdust, it is said, makes a very good coating for steam pipes and boilers, to prevent loss of heat. It adheres very firmly to iron, but on brass or copper it is necessary to apply a very thin coat of fuller's earth, when the paste will adhere with sufficient tenacity. Out of doors, it is advisable to give a few coats of coal tar, after the necessary number of coats of the sawdust paste, to make the covering waterproof. About five coats of the paste will be found to be sufficient, and each should be allowed to dry perfectly before the next is applied.

## GOOD HEALTH.

## Helping Nature in Cures.

The *Journal of Chemistry* has an article maintaining the strength of nature to throw off many troubles if she is given but a fair chance to do it. We quote a few paragraphs: "The 'cure' of diseases is rendered possible by certain conditions which, alas, are too often wanting in both adults and children. Medicines (a term applied to certain substances, vegetable and mineral), if intelligently employed, are of service to the physician in the care of the sick. The indiscriminate use of drugs will not, however, cure disease, but will, on the other hand, certainly aggravate and complicate every form of physical and mental derangement. The notion that there are simple or compound agents adapted to remove physical ailments under all circumstances is fallacious and absurd. Cures, so called, do not often result from the use of remedies alone, but from nature's efforts, assisted by proper dietary and sanitary regulations. The tendency of nine-tenths of all disease is towards recovery. It is astonishing how tenaciously life clings to the frail body, when it is racked with pain or consumed with fever. Body and spirit part only after a desperate conflict, in the usual forms of disease. The conflict is between the chemical forces on the one hand, and the vital forces on the other, and the destructive chemical forces are most frequently beaten in the fight. It is through vital action that the spirit makes defense, and by it not only are all the strongholds of the body defended, but also the outposts, where the slightest danger is possible. If through habits of life or from accident the vital powers are weakened, then chemical action begins; and when death ensues it obtains complete mastery over all that is perishable, and its assault does not cease until every portion of the body is resolved back to the inorganic world from which it came.

The important lesson to learn is how to help nature in her efforts to cure for us. If the indestructible part of us does not act harmoniously, we are soon forced to yield the body to decay; body and spirit part company. Sound health, which comes from an observance of nature's laws, is the greatest earthly blessing. There is no occasion to talk of cures where there is no disease;

and whilst it is impossible for us to live superior to accidents, it is possible to help nature better than we do in her care of our bodies.

**REMEDY FOR INSECT BITES.**—We read the following in an exchange, and shall give it a trial: When a mosquito, flea, gnat, or other noxious insect punctures the human skin, it deposits or injects an atom of an acidulous fluid of a poisonous nature. The results are irritation, a sensation of tickling, itching, or of pain. The tickling of flies we are comparatively indifferent about; but the itch produced by a flea, or gnat, or other noxious insect, disturbs our serenity, and, like the pain of a wasp or bee sting, excites us to a remedy. The best remedies for the sting of insects are those which will instantly neutralize this acidulous poison deposited in the skin. These are either ammonia or borax. The alkaline reaction of borax is scarcely yet sufficiently appreciated. However, a time will come when its good qualities will be known, and more universally valued than ammonia, or, as it is more commonly termed, "hartshorne." The solution of borax for insect bites is made thus: Dissolve one ounce of borax in one pint of water that has been boiled and allowed to cool. Instead of plain water, distilled rose water, elder, or orange flower water, is more pleasant. The bites are to be dabbed with the solution so long as there is any irritation. For bees' or wasps' stings, the borax solution may be made of twice the above strength. In every house this solution should be kept as a household remedy.

**CURE FOR A SCALD.**—A scald is most painful, it matters not whether it comes from a huge steam boiler or a cabbage-kettle, and a cure should be borne in mind. Dr. Waters, of Salem, recently showed before the Massachusetts Dental Society that bicarbonate of soda, such as used for cooking purposes, or any other alkali in neutral form, would afford instantaneous cessation of pain from the severest burns and scalds, and would cure such injuries in a few hours. Deliberately dipping a sponge into boiling water, the doctor squeezed it over his right wrist, producing a severe scald around his arm and some two inches in width. Then, despite the suffering occasioned, he applied the scalding water to his wrist for half a minute. Bicarbonate of soda was at once dusted over the surface, a wet cloth applied, and the pain, the experimenter stated, was almost instantly deadened. Although the flesh on the wrist was literally cooked down to the sweat-glands, and the wound was of a nature to be open and painful for a considerable time, on the day following the single application of the soda the less injured portion was practically healed, only a slight discoloration of the flesh being perceptible. The severe wound in a few days, with no other treatment than a wet cloth kept over it, showed every sign of rapid healing.

**THE APPETITE.**—To know when and how to follow the instinct of appetite, to gratify the cravings of nature, is of inestimable value. There is a rule which is always safe, and will save life in multitudes of cases, where the most skillfully "exhibited" drugs have been entirely unavailing. Partake at first of what nature seems to crave, in very small quantities; if no uncomfortable feeling follows, gradually increase the amount, until no more is called for. These suggestions and facts find confirmation in the large experience of that now beautiful and revered name, Florence Nightingale, whose memory will go down with blessing and honor, side by side with that of the immortal John Howard, to remotest time. She says: "I have seen, not by ones or tens, but by hundreds, cases where the stomach not only craves, but digests things which have never been laid down in any dietary for the sick, especially for the sick whose diseases were produced by bad food. Fruit, pickles, jams, gingerbread, fat of ham, of bacon, suet, cheese, butter-milk, etc., were administered freely, with happy results, simply because the sick craved them."

**SUPERB VENTILATION.**—This morning we happened to remark to one of our city physicians that the concert last night was very good, to which he replied warmly: "It was, indeed, most excellent, the best thing of the kind that ever happened in San Antonio."

"But how do you know all that; you were not there, were you? we wanted to know."

"I know I wasn't there, but I happen to know that nearly everybody that was there is under treatment for rheumatism, neuralgia, pleurisy or influenza. I have about fifteen cases myself, and all respectable people who pay their bills. The performance was truly excellent."

It was very chilly in that hall last night. There is no mistake about that. The ventilation was superb.—*San Antonio Herald.*

**LIFE AND DEATH.**—One-half of the human family, says *Hall's Journal*, dies under 17 years of age. Nine-tenths of all who are born ought to complete their "threescore years and ten," because nine-tenths of all diseases are avoidable by the steady practice of temperance and such out-door activities as are encouragingly remunerative. There is a still more specific method of lengthening life in healthfulness and vigor, and one which is practicable by the masses. Colds or constipation immediately precede or attend almost every case of ordinary disease. The latter can be antagonized by abstinence, cleanliness and warmth for 36 hours; and a cold need not be taken once a year if three things are attended to: Avoid chilliness, damp clothing, and cooling off too soon after exercise.

## The Week.

All the "strike" excitement has died away and quiet reigns once more. In the East some of the Pennsylvania miners are still turbulent, but on this coast there is no trouble. Several items of importance in connection with the mining interests have developed themselves this week. Prominent among them is the cessation of work in the new tunnel on the Mariposa estate (noticed elsewhere in this issue), caused by a foreclosure suit. This has been expected for some time by those well informed of the condition of affairs, but it is very hard with miners who are thrown out of work. A strike is announced in the El Dorado South mine at Belmont, where, while raising a chute from the lower level, they found some antimonial silver ore assaying from \$300 to \$800 per ton.

A rich gold-bearing ledge is reported as having been discovered in Broad canyon, in the Toiyabe range, about 50 miles from Austin, and there is considerable excitement in Jefferson and that part of Nye county, over it. Within the past few days an amicable adjustment has been made of the litigation between the De Fries and Grand Prize mining companies, the latter company agreeing to deed the former the "debatable ground" after obtaining a patent for it. After an interval of several months the La Grange ditch company has declared a dividend of 25 cents per share. Another mine has been added to the dividend-paying roll this week. This is the Leeds mine of Utah, where reduction work was commenced last February. There are 60,000 shares, and the dividend just declared is 20 cents per share, aggregating \$12,000, payable on the 20th.

## Prospecting.

The shutting down of numerous mines, and the reduction of force in some of the large ones in Nevada lately, has had the effect of setting a lot of miners on their own resources. In many cases this has, of course, caused distress, especially where the men had families to support and could find no other employment. In most of the larger camps, where the companies have been compelled to reduce expenses, this state of affairs exists to a greater or less degree, so that the mere change of location from one place to another is of little or no benefit. On the Comstock, although there are 3,516 men at work at four dollars per day, receiving in the aggregate \$14,064 per day, there are also 3,000 idle miners there. A large number of them have left for other places, and finding the same state of affairs, have been compelled to do the best they could.

Under these circumstances, the ranks of the prospectors have been materially swelled, more especially in California. Men who could find nothing else to do found it better to start in and prospect than to lie about idle. Although the cause is to be deplored, the effect has, in a measure, been productive of good, for a great many claims have been found within the past few months, and are now being worked by their owners.

In Nevada, Sierra, Plumas, Placer, and adjoining counties, the prospectors have been roaming over the hills and through the gulches, looking for anything which would give them a living. Claims which the miner of early days would have passed by as worthless, have been taken up, prospected and worked, and answered the purpose of giving a living to from two to half a dozen working miners, and in some instances rich strikes have been made. Mines worked ten or a dozen years ago and abandoned have been reopened, and when worked by the owners themselves for their own interests, have been found to afford at least a living, and often more.

There still remain many places where energetic prospectors have an opportunity to try their luck. It does not take much money or much of an outfit to start on a prospect. Men in this occupation live at very little expense, indeed much cheaper than they can when boarding or living otherwise in the towns. Prospecting, properly done, is by no means easy work, as many a long weary tramp has to be taken with unfruitful results, and many hard blows must be struck in vain. Still, there is always the hope present that the claim in hand may be valuable, or that this or that gulch may have enough left in it to pay for working. Again, there is always the chance open to every one of striking something rich, which will place the lucky owner in a position difficult to attain by working for days' wages alone. The prospector, if he has any money at all, is as independent a man as can be found. His necessities are small in the matter of food, and smaller still as regards clothes. His tools are inexpensive and durable, and if he does strike anything, he is no longer compelled to seek the good offices of some superintendent for a chance to earn his daily bread.

Our miners should see cause to thank their stars that they are in a country where the precious metals abound, and where there is an opportunity to better themselves. In the East the position of the miner is much worse than here. If they lose a job, they cannot go to work and prospect for coal and iron, for it would do them no good if found; but here, if a claim with gold ore is unearthed, the owner can work it himself on a small scale, and at least earn a living. Our miners are by all odds better off than those in the Eastern States, where great distress prevails.

## A Metric Cup.

L. B. Healy, of this city, has patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, a "metric cup," which forms a simple and convenient device for illustrating the decimal system of weights and measures. It consists of a measuring cup, having a holding capacity equal to one kilogram of water, liquid measure, while its exterior measurement coincides with a cube whose edge is one-tenth of a meter, lineal measure, representing the capacity of a liter, solid measure, and in which the area of one of its sides is a square decimeter equal to one-millionth part of a hectare, superficial measure.

The area of each side or face of this cup is equal to a square decimeter; that is, each of its four edges is one-tenth of a meter in length, so that the cube represented by the square is equal to one liter, or one-thousandth of a stere. Now, according to the metric system of weights and measures, one kilogram of water weighs one liter, so that a cubic quantity of water equal to the cube represented by the exterior of the cup represents one kilogram. This cup will therefore contain one kilogram of water minus the quantity of water displaced by the thickness of the sides of the cup. To remedy this difficulty the handle of the cup is made hollow, so that it will contain a quantity of water equal to the quantity displaced by the sides of cup,

thus providing a measuring cup that will contain one kilogram of water at the same time that each of exterior surfaces represent a square decimeter, while the cubic measurements of the cup represent a liter. The sides of this cup can be marked, if desired, to represent their measurements, and a scale can be marked on one or more edges, giving the graduations in inches and tenths of a meter; but these features can be dispensed with, as they only serve as instructions to the user to indicate the actual size and measurement of the parts.

## The Labor Problem and the Mines.

The whole country seems to be just now full of men wanting employment. The labor supply everywhere exceeds the demand. This condition of things has frequently obtained in other parts of the world, but never before to the same extent in the United States, and may be said to exist for the first time in California. There is a stagnation in all our great industries, and this, in the Eastern States, not so much because there has been there a great over-production as because the people have, for various reasons, been forced to practice unwanted retrenchment and economy. Fewer manufactured commodities having been consumed, the stock on hand has proved ample for present wants without further immediate production. Hence, factories run short time, or shut down altogether. The practice of greater economy is shown, also, in the lessened importation of foreign goods. Through this curtailment of manufacturing and increased frugality there has been brought about a reduced consumption of coal. By reason of this, large stocks of this fuel have accumulated, throwing thousands of laborers out of employment in the great coal regions, and restricting transportation on the railroads and canals. With their business so restricted these carrying companies have in turn been compelled to diminish the number of their employees in like ratio. And so this process of retrenchment, applied to one branch of business, has reacted upon another, until a general industrial paralysis has ensued, leaving vast numbers of people out of work.

While we on this coast have suffered somewhat from the causes above recited as operating in the East, the present depressed condition of the labor market here is mainly due to the drouth that prevailed during the early part of the year, to the great detriment of our two leading pursuits, agriculture and mining. With the usual amount of rain at that period we should have been moderately prosperous, though it cannot be denied that our present industrial and financial distress can be traced in large part to other causes, some of which have been for a long time in operation.

Stock gambling has seriously crippled or wholly ruined vast numbers of our people. We, like the rest of the world, have of late years been living beyond our income and prospects—have been earning too little and spending too much. These habits, contracted during the flush times, have been continued on into these days of diminished opportunities and reduced wages, very few of the older residents on this coast having been able to accommodate themselves to these new conditions.

As building in the city, upon which, in ordinary times, our white male population largely depend for employment either directly or indirectly, has almost ceased, we have now an unusually large number of this class out of work. The men more or less affected by dullness in this line of business consist of carpenters and joiners, lathers, masons and their attendants, painters, plumbers, teamsters, lumhermen, brick and lime burners, iron molders, etc. As building is not likely to soon regain its wonted activity, these classes must necessarily look elsewhere for something to do.

Now, it occurs to us, there ought to be many places throughout the mining regions of California where men like these, able and willing to do all kinds of hard work, would be able to earn small wages, either working for themselves or others. There are certainly many spots in the placer mines of this State that would yield a dollar or two per day under well applied, persistent labor. Old miners must know of many such places, and might, through the local newspapers, advise the public as to their whereabouts, as they will probably never care to work themselves. Many of these miners have also claims that they might like to have worked on shares, and in that way may realize something from them, instead of allowing them to lie idle and unproductive. If these parties will, through the local press or otherwise, bring such facts home to our knowledge, we will publish them for the benefit of all concerned.

Again, this is a favorable time of the year for companies contemplating the building of new ditches, flumes, reservoirs, bed-rock tunnels, and similar works, to inaugurate the same; an additional reason for undertaking such improvements just now being found in the low rates of wages that prevail. Lumber is also very cheap at present, and there is little doubt but improvements of this kind could now be made at a less cost by forty per cent. than ever before. A good many Chinamen are now being employed in the mines. Could not white men be, to a considerable extent, substituted for these without detriment to the employer?

The low stage of water in the mountain

streams has encouraged the undertaking of extensive river-bed operations this summer. Could not those engaged in these enterprises greatly increase their working force to advantage?

We shall probably have an early winter, and it might be good policy for this class of miners to push work with expedition, and get out as much gravel as possible before the water raises upon them and stops further operations. The season approaches, and has already come with many companies, when the ditches and flumes are to be cleaned out and repaired; when old pipes are to be removed or new laid down; when the pits must be cleared up, and the hydraulic mines generally be put in proper shape for the winter campaign; all of which creates a slightly increased demand for labor.

In response to these inquiries and suggestions, we hope to hear from many quarters of openings and opportunities for the employment of some considerable portion of the surplus labor that has accumulated in this city, and which, the world over, seems just now to be so superabundant.

## Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective Superintendents on file at the offices in this city:

A new hoisting engine will soon be put in at the Justice mine.

Rapid progress is being made in retimbering the Bullion shaft.

The bullion yield of the Chollar during July amounted to \$34,000.

A great many miners are leaving the Comstock for the mining camps in the eastern part of the State.

Of the total bullion yield of the California mine for July, \$712,166.12 were in gold and \$687,165.67 in silver.

The Matamoras furnace at Eureka, Nev., is producing daily about four tons of bullion, worth on an average \$400 per ton. New developments are reported in the mine.

A sket, weighing 2,700 pounds and having a carrying capacity of four and one-half tons of rock, has just been completed at the Gold Hill foundry for the new Yellow Jacket works.

The Ophir mined 90 tons of ore last week. In the east cross-cut from the bottom of south winze, on the 1800-foot level, they have to keep a drill hole four or five feet ahead for protection against an influx of water.

In the Bullion work has been resumed in the north drift in a formation of vein matter, carrying mineral.

Chollar turned out last week 489 tons of ore, assaying \$22 per ton.

The cross-cuts in the Overman all continue in a very promising character of quartz and vein matter.

In cross-cut No. 3 from 1700-foot level of the Best & Belcher, quite a stream of water comes from the drift. On account of the intense heat no work is being done on the 1700-foot level. For two months the same amount of air now required to run this one cross-cut could run three, and this is attributable to the striking of water so hot as to raise the temperature from 86° to 116° Fahrenheit.

The incline of the Hale & Norcross mine was partitioned last week from the 1700-foot level up to the 8th station.

Eureka Consolidated delivered at furnaces, last week, 760 tons of ore of good grade, and carrying at least 30 per cent. of lead per ton.

The Martin White Co. shipped from Ward district \$35,000 in gold bullion, in July.

The vein in the slope of the Gila is producing very rich ore.

**GOLD MINING IN CHILI**—The placer mines at Catapilco, Chili, which were prospected by Dr. A. P. Burns, last season, for the San Francisco and Catapilco gold mining company, have been sold to La Ligua gold mining company, of New York city, and they are preparing to erect large and expensive hydraulic works. From working tests, the gravel deposits at Catapilco average 50 cents per ton. A 400-horse power engine will be employed to pump the waters from Catapilco lake to an elevation of 450 feet, where over 10,000,000 gallons of water will be deposited in a reservoir every 24 hours. From this reservoir two 15-inch pipes will supply four of Craig's nozzles. The sluices are to be paved or lined with old railroad iron, and all the works are to be first-class in every particular. The new company is a "close corporation," formed principally of Eastern capitalists, who have employed an experienced California hydraulic miner to superintend their works in Chili.

**MINING ACCIDENTS.**—Already this month there have been nine mining accidents on the Comstock, three of them fatal. The names of the victims, so far, are F. J. McDonald, who was killed in the Justice incline; John Henry Goldsworthy, who received his injuries in the Consolidated Virginia shaft; and Morris Connor, who met his death in the Savage mine, while helping to lower a pump, the whole weight of the pump falling on him by the slipping of a rope. One man, named St. John, had his fingers crushed, one day this week, so badly that they had to be amputated. He was a carman, hauling ore from the railroad dump to the Rhode Island mill. This man is out of luck. By a previous accident he lost all of the fingers of his left hand, so that at present he has but two fingers with which to work.

### The California Sugar Refinery.

Prompted by curiosity to know something of how our coarse brown sugars are treated to bring them out so clear and white as they appear in the market, we went through this large refinery last week. Accompanied by the courteous son of the manager, Mr. John Spreckles, and by him furnished with sugar-proof coat and hat, we started in with an examination of the crude sugar, as purchased from the Sandwich Islands and Manila, for these are the principal kinds used, though at odd times a cargo of South American or of East Indian date sugar is purchased. Mr. Spreckles keeps a well appointed laboratory for the analysis of water (in the search for a pure article of which they have sunk several artesian wells) and of sugar. This is very necessary, as in one sample of sugar submitted much saltpetre was discovered, and the cargo rejected.

Submitting a fair article of Sandwich Island sugar to a good microscope we saw numerous turtle-shaped insects, with six legs, proboscis and tail, not over active in motion, but still enough to set one's stomach crawling even to think of eating them. We shall never, never use any more brown sugar; no sir! From the laboratory we passed into the main building, and took a look at the "blow ups," where the sugar is first dissolved by steam, and treated with lime and blood to correct acidity and clarify it. The huge vats looked like so many cauldrons of dirty, seething water, and the men skimming it did not hesitate to dip deep when they put in their ladles. The skimmings are pressed through canvas by screw power, and the juice expressed again returned to be re-clarified. The cakes of dirt obtained look and smell like ordinary clay, and are thrown out to be picked up by the poor for fuel. From here the syrup is pumped up to the fourth story into huge iron receivers, from which it passes through bag filters on its way down again. Here another lot of dirt is taken out of it, which, to all appearances, is just like the first only finer grained. The bag filters are double, being a large fine bag drawn inside of a small coarse one, and are thoroughly washed and cleansed after each use.

After leaving these last filters the syrup percolates through bone charcoal, and comes out below, changed from a burnt umber color to light straw color, and then is again pumped up into the fourth story to the vacuum pans, where it is evaporated to the crystallizing point, and then goes down again into receiving tanks that have in them large revolving dashers to keep it in constant motion to prevent the grains separating from the syrup, and also to still further assist crystallization.

From these receivers it is passed into "centrifugals," which act on the principle of smut mills in making flour. They are stationary cast iron urns, having within them rotary copper ones perforated with fine holes, through which the molasses is forced by the rapid rotary motion imparted to them, leaving the sugar within beautifully white and clear.

But this is not all. The sugar is now put in casks and passed up two stories, where it is pressed into cakes by a knuckle press invented by Mr. Spreckles, and only in use in this refinery. These cakes are then set up to dry for a time spontaneously, and then treated to a hot air bath of 130 degrees for forty-eight hours, which drives all moisture from them, and they are then passed through the crushing mill and cubing mill respectively, as required. Whatever small crumbs are made in either of these mills are put through another grinding process, and both come out powdered and fine crushed sugar.

That follows the sugar once through, but no syrup has yet been made. The syrup from the centrifugals is again hoiled and evaporated and goes through the centrifugals, and become No. 2 sugar. The residuary syrup is thus reboiled to the fifth time, and what then remains is golden syrup, which utterly refuses to crystallize.

The sugar made at the third, fourth and fifth process is mixed in varying proportions, and constitutes what is known as golden C and coffee C sugar. The second time boiled the sugar will not crystallize in less than two days. The third time it has to stand two weeks. The fourth and fifth times four weeks and more are required.

All the tanks and vats used in the establishment are of iron, and vary from a capacity of about one hundred gallons up to eight tons, which latter is the capacity of the charcoal vats, of which there are one hundred and seven. The charcoal once used for twenty-four hours is

withdrawn and subjected to a heat of eight hundred degrees for revivification, and is then ready to use again, and lasts for years. When drawn from the vats it will not stick to the lips at all, but after being purified by this intense heat it adheres quite tenaciously.

The evaporation of the sugar to produce crystallization is carried on in a vacuum, created by an immense pump, which draws the air out of the vats, which will then boil at 140 degrees, whereas 212 degrees is the boiling point in open air. When the sugar crystals begin to form in the pans more syrup is let in, which proceeds to crystallize upon the crystals already formed, not making new ones for itself. Four hours generally suffice to finish this process the first time.

The refinery is of brick, four stories, having a frontage of two hundred and forty feet on Brannan street, and is built in two sections of equal capacity. One was built in 1869-70, and the other in 1872. It can turn out one hundred and twenty tons of sugar per day, employing a force of two hundred men. The old wooden building used by them before that time on the opposite side of the street is now employed as a stable and storeroom for cooping materials. An engine of two hundred horse power furnishes all the power required, and steam is made in sixteen boilers. They have every protection possible against fire, by means of hose in all stories of the building, four hydrants, and two steam pumps, and men trained in the management of the hose.

We confess to having had a prejudice against

### Big Clean-ups.

The clean-up of the Consolidated Virginia mine for the last fiscal month was \$1,535,328.97; the fiscal month was shorter than the last, the California mill having been run but 29 days, and the Bacon and French but 28 days. The clean-up of the California mine was \$1,399,331.74. This makes a total for the bonanza for the month of \$2,934,660.73.

These figures show a production from these of nearly three million dollars for a single month. We have been so accustomed, for the past year or two, to see in print similar results from these two famous mines, that we do not appreciate them sufficiently. A few years ago we would have considered three million dollars a very large amount for a first-class mine to have produced in a year; even now it is more than most prosperous districts turn out from all the mines combined. The sum is a very large one, and if it were scattered about more in the community than it is, would be truly sufficient to cause better times. Even as it is, it does considerable good in many ways.

Three million dollars a month from two mines for many consecutive months is a better showing than can be made in any mining country in the world, and is probably more than was ever realized from any mines in the same period of time. Some of the old South American and Mexican mines yielded larger sums in the aggregate than the Comstock bonanza, but it took

### The Preparation of the Fair.

To those who only see the pavilion in its present state of completeness, no stretch of the imagination can present to the mind's eye, the utter confusion, hurry and hustle, pounding and sawing, of a few days since. The order and beauty we see around us in this vast enclosure is the result of patient labor, and vigilant watchfulness on the part of both exhibitors and officers of the fair. It is an easy matter to chalk out each man's space, and say to him "There is your allotted position;" but it is a most difficult matter to make him understand that any deviation from that chalk line discommodates others and throws the Superintendent's plan out of harmony.

On paper the lines look perfectly satisfactory, but in the pavilion they do not always appear to the eye single to its own interests, harmonious. When he gets his counter, case, shelving or stand, as the case may be, with his goods into the position assigned him, the arrangement of his neighbor's exhibit may be such as almost entirely bide his view, and he is dissatisfied at once, and wants to move elsewhere. Or, perhaps, he would like to turn his space around, and have his parallelogram face in another direction; or his articles may be too crowded, or large for his space, and he must have a little more room. No one can imagine the amount of labor and talking that is required to reconcile these matters and preserve the organization of the whole, who has not been present for at least some hours during the influx of exhibits in the last day or two before the opening of the pavilion. Superintendent Gilmore was cornered on every turn; he was walked from one end of the building to the other constantly and repeatedly. Beckoned here and there as he passes hurriedly from one place to another, it was wonderful that he should preserve his temper and be able to respond to so many calls, and not get too confused himself to attend to any. He is the champion walker of the Pacific Coast, and ought to be Quartermaster-General of the United States.

Not less active were Secretary Culver and the other officers, and none of them had a lull left for an importunate exhibitor to lay hold of to detain them. All gone thrice over. But the battle is over, and comparative quiet reigns in the pavilion. The sound of the hammer and saw, the shout of the drayman, the snort of the restive horses, the ting-a-ling of the alarm bells responding to the efforts of the adjuiter, are done away with, and all is peace and tranquil quality within our walls. The hum of an admiring multitude takes the place of the din of constructive industry. The yell of the perspiring drayman is succeeded by the laugh of beauty and the merry chatter of the small boys, which latter are to be always found in the van of curiosity wherever we go. Weeks of quiet enjoyment will now succeed the days of busy, noisy preparation, and then will close the twelfth industrial fair of the Mechanic's Institute of San Francisco.

The managers may now sit them down in comparative peace, and congratulate themselves on their well-earned success in the conduct of the present exhibition. Announced, as it was early last winter, when everything looked favorable for one of the most prosperous years that the State ever saw, it has required their most persistent and active exertions, in the face of the entire change in the financial outlook of our State, to bring the Twelfth Industrial Exhibition up to the high standard of excellence attained by its predecessors. That they have done so is a source of pride to them and our city at large, and all honor is due them for it.

Much praise is due them from our citizens for having provided so instructive and entertaining a place of resort for our young folks and mechanics, while at the same time they have given zest to the workman's exertions in his own and employer's behalf, by reason of the encouragement he receives at the fair that his labors are appreciated. It gives an impulse to industry in every department, and to their exertions, in a great measure, is it all due.

United effort will accomplish much in any direction; but when that effort comes from such men as the board of managers, seconded by a San Francisco public it amounts to the annihilation of all obstacles and perfect success in any undertaking. Our city is noted for its thoroughness in every undertaking, whether it be of vigilance safety committees, charity or public works, industrial or other fairs, and we yield the palm to none—not even the American Institute exhibition of New York—only to the great Centennial, which had a million and a half from the public purse.

PROPOSED TUNNEL UNDER ENGLISH CHANNEL.

powdered sugar, believing from taste that flour might have been added. Now, our prejudice is transferred, in an increased ratio, to the Sandwich Island sugar. Having followed the sugar through the whole process with an eye out for adulterations, we must express confidence in the purity of the product of this refinery. Nothing that could be mixed with it was anywhere about, but sugar was everywhere; the floor, the walls, the steam pipes, the ladders, the ceiling, are all covered with sugar, but no dirt is there except what comes out of the sugar itself. It is extremely hot in all parts of the building, as it must be from the radiation from hundreds of tons of steam heated sugar, and in some parts of it the thermometer must mark 130 degrees all the time, which would be severe on men in any other than a San Francisco climate.

### The Channel Tunnel.

We have, from time to time, made note of the progress made in works preliminary to the great bore beneath the English channel, through which laden cars may be drawn from Dover cliffs to Calais town. The engraving on this page, borrowed from the *Polytechnic Review*, shows the tunnel as projected at the time the preliminary works began. More recent information seems to indicate that it will be of advantage to make the tunnel take a devious course, but this is not fixed upon as yet.

The channel tunnel is a topic of wide interest, because it will release so many from the agitation of the channel sea, and reduce the time required in the transit. It is of interest, also, because the project has been so long under consideration. At the time of the first Napoleon it was an old scheme, but one in which the "conqueror of Europe" took deep interest. Fox, the English statesman, also had the tunnel as a pet project. In our day the dream of the fathers bids fair to be realized. Our illustration will be borne in mind by the reader, as we shall record the progress of the venture as the reports come to hand in our foreign exchanges.

years and years to accomplish. Now, with improved appliances and machinery, skilled workmen and every convenience, the ore is rapidly extracted and quickly made to yield its precious contents. The precious metal is sent down for refining as fast as collected, and is then coined into gold and silver at the mint as expeditiously as possible. The whole operation is carried on with a rapidity and system unknown and impracticable until recently. The mills are the finest in the world, and all the machinery is unexcelled, so that every possible convenience for good and rapid work is at hand. Of course such results could not be attained, no matter how fine its machinery, unless the ore were first class. In the last run the California mill worked exclusively its rich ore from the 1650-foot level, averaging 330 tons per day. This ore works as well as any on the lode. The other day, from a run of 24 hours, 9,000 pounds of amalgam were taken out, which shows the richness of the ore and the rapidity with which it is worked.

Of course bonanzas of this character are scarce, and it was only with great expense and continued prospecting that this ore was found. It was blind work, too, from the nature of the undertaking, for no man could say that, sinking the shaft, the proprietors were not also sinking their money, as has too frequently happened. As soon as the bonanza was struck, however, it amply repaid all trial and expense, and has sent forth, since its discovery, a stream of gold and silver such as was never dreamed of before.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: Northern Belle, August 7th, \$7,607.46; Con. Virginia, 9th, \$250,285.33. Total for July account, \$1,535,328.97; Arizona 9th, \$834.33; Grand Prize, 10th, \$13,400; Aug. 14th, \$13,400; Tybo Con., 9th, \$4,322.04; California, 13th, \$267,957.16; first shipment August account; Con. Virginia, 13th, \$98,394.27; first shipment August account; Tybo Con., 9th, \$4,287.02; total to date, \$13,024.15; Northern Belle, Aug. 12th, \$9 358.

## Means for Promoting More Perfect Combustion of Coal.

At the tenth annual convention of the American Railway Master Mechanics' Association, one of the committees submitted an excellent report on the best material, form and proportion for locomotive boilers and fire boxes. In the course of this report they discuss the question as to whether it is beneficial to admit air to the fire box above the grate, in the use of bituminous coal in locomotive boilers. As the principles involved are applicable to all kinds of boilers and furnaces where perfect combustion is desirable, we believe the following portion of the report, which we reprint from the *Railroad Gazette*, will prove of general interest to consumers of coal:

"Your committee do not undertake to harmonize the different views expressed by those believing that the admission of air at such point is beneficial, and those who do not. The admission of air above the grate can be useful only in one particular, to furnish oxygen to unite with the gases evolved from the coals that otherwise will not receive it, and as a consequence pass through the tubes unconsumed, rendering no useful effect. An excess of air is hurtful, from the fact that it lowers the temperature in the fire box to that extent, giving back no heat in return, as only the requisite proportion of oxygen will unite in combustion with the carbonized hydrogen, and the excess of air, whatever quantity that may be, will not burn, but absorbs air and carries it off. The quantity of gas evolved from the coal in a given time is constantly varying, in the usual way of firing a locomotive. For instance, after coals have been placed in the fire box and subjected to the heat for a few seconds, the gas is evolved from it, and the air passing up through the opening between the lumps and particles it burns with a clear white flame, the combustion being then nearly or quite perfect. If air is then admitted in considerable quantities above the grate, it serves no useful purpose at that particular time, but rather the contrary. Then, in a few seconds more, several shovelfuls of fresh coals are thrown in, filling up or covering over the small air openings between the coal on the grate cooling the interior of the box to a certain extent, and at the same time the gases from the fresh coals are cooled, needing a supply of oxygen, without which they will not burn. Yet that supply of air is to a great extent cut off at that particular moment by the closing of the openings from below, as stated; and if air is not admitted above the grate in liberal quantities, combustion of the gases is not accomplished, or only in part, and the result is a cloud of smoke, until the greater portion of the gases is driven off, and air again finds its way up through the coals, to give the remainder of the gases the requisite oxygen for their perfect combustion, this operation being repeated every minute or two, or oftener, while running.

"As about one-third of the heating value of bituminous coal is the combustion of its gases, it is of very considerable importance that it be accomplished with the least possible waste; yet the difficulties to be overcome, to accomplish that end, are greater than are generally acknowledged. The difficulties are supplying the requisite supply of air to the gases, at the right time and place, needed for their perfect combustion. If air enters only through the grate and the coal on it, we find that the time that most is needed is just when it is the most difficult to get it in that way, and when the least quantity will be supplied. If through fixed openings above the grate large enough to admit the maximum quantity needed at a given time, then too much is admitted when the minimum is required. If we depend for the requisite supply upon both sources, the case is not altered in effect. Perhaps no better arrangement can be adopted in practice than a sort of compromise between admitting too much when the minimum is required, and too little when the maximum is needed. The area of such openings above the grate to accomplish that object best will vary with the kind of coal used, and can only be determined by test or experiment in each particular case."

## The Mines at Beulah.

A correspondent of the *Visalia Delta*, writing from Beulah, gives the following in regard to the mines there:

The somewhat conflicting reports of the various correspondents of this place have induced me to give you the following items based upon my own observations:

In justice to all concerned, I must say that the numerous assays made by myself of average samples of the ore now being roasted by the N. E. T. & S. Co., and the report of the working test made in San Francisco by parties whose ability and integrity are not questioned, show that the ore is rebellious. Average samples of this lot show it to consist of 70% to 75% of iron, zinc, sulphur and other substances in small quantities. The nine pounds of bullion yield at the rate of \$237.99 in silver and \$2.55 in gold per ton. The "bullion" run out last year is principally iron. Besides this it contains lime, lead, zinc, silver, gold and sulphur. To the latter it owes its brittleness.

Yesterday afternoon I visited the Loup claim. The Crabtree Bros. were working a little to the north of the company's tunnel. At a depth of about eight feet the leading ore vein

has widened to about 20 inches, is comparatively free from iron and zinc, and would probably smelt without difficulty, and is increasing in width and richness as they go down. On the McGinnis a shaft is commenced in a new place. At a depth of about 12 feet a small vein of good smelting ore has been struck. The claim owners propose to continue sinking, and will very likely find considerable good ore. The Chibuhua ore is also very good. The vein is not large, but increases in width as it goes down. A tunnel or incline on the ledge would show good ore. The indications warrant further prospecting. On the Lady Franklin a 30-foot tunnel has been run all the way in ore. About 25 tons of ore are on the dump. But it is low grade and considerable trouble will be found in working it. The tunnel is too near the surface to properly prospect the claim. An incline following the dip of the ledge would be better, and better ore would probably be found. Two shafts are working on the Mammoth. They are running a short tunnel preparatory to the sinking of a shaft. Considerable antimony and sulphurets of iron are found in the surface ore. Not much ore has yet been extracted. The indications are favorable for better ore as they go down.

By examining the various claims in the district, it appears advisable to prospect deeper than they have yet done. Judging by present indications much better ore will be found, and while this is being reduced the more rebellious surface ore can be worked in with it with much less trouble and expense than to work the surface ores alone.

The milling ore of the district consists principally of gold and silver-bearing sulphurets of iron and copper.

A small-sized rock furnace is being built about a quarter of a mile below the company's. Though there is not yet much soft ore extracted, enough can be obtained to keep this running the balance of the season.

The company's Black Wolf tunnel will prospect the ledges on the east side of this district, between Lake and Lady Franklin canyons.

## Fresno County Mines.

A correspondent of the *Fresno Examiner*, writing from the Champion quartz mine says: Knowing that you take a lively interest in all that pertains in any manner to the prosperity of Fresno county, and that a few items in relation to the quartz mines of this vicinity may prove interesting to your numerous readers, I will endeavor to give you a brief description of the Champion lode, about one mile east of Big Dry creek, where that stream passes out of a gorge in the foothills into the valley. The Champion lode is situated in a vast dyke of slate, which is about one mile in width at this point; the course of the ledge is N. W., S. E., and outcrops occasionally for about a mile. That this lode of quartz is a valuable gold-bearing vein, has been demonstrated by actual milling tests. The vein of quartz varies in width from two to twelve feet in thickness, all carrying gold an average of ten dollars per ton. There are four claims on the ledge that have been prospected to a depth of forty to fifty feet by shafts; on two of the claims only has there been any drifting done. The "Original Champion" location was made in May, 1866, by R. M. Keys and the Atwell Brothers. These parties performed considerable work on their claim, and in the following month of December sold out to Messrs. Belloys, Badger & Co., of Lugo county. These gentlemen did considerable work, amongst other things, sinking a shaft some thirty odd feet, and taking out considerable quantity of good ore. I am informed that some of the ore taken out of this shaft was very rich, being valued at one dollar per pound. Other business requiring their attention, they have done nothing more than the necessary work to hold their claim, for several years past.

The next claim to the south-east is the property of Messrs. Jensen & Keyes, and consists of 800 linear feet. The developments on this claim consist of one shaft down thirty feet, also another shaft down fifty feet, and a drift at the bottom of twenty-five feet; also a short drift on the twenty-five foot level. The next claim to the south-east, owned by Capt. W. J. Smith & Co., is 1,500 linear feet in extent. This claim has been more extensively opened than any other on the lode. An open cut and a drift of about one hundred feet has been run into the side-hill; a shaft sunk at the commencement of the cut to a depth of forty feet to the south-east; inside the drift, a winze was sunk a depth of thirty-five feet, and the outside shaft and winze connected at the bottom by a drift, showing the vein at that depth varying in thickness from two to five feet, and being encased between well-defined slate walls, with a heavy gouge next the hanging wall. One lot of thirteen tons of ore, taken from this mine, milled \$24.50 per ton. There have been 100 tons of ore worked in the mill from this mine, and the average gross yield of bullion was \$15 per ton. This is the farthest claim to the southeast on the lode. Adjoining the "Original Champion" on the northwest is the "Gray Eagle" claim of 1,500 linear feet, which was opened by a shaft to the depth of forty feet, in the summer of 1875, and one lot of ore from this shaft worked in an assay yielded \$12.40 per ton; also 10 tons worked in mill yielded \$10 per ton. No work has been done on this claim since the summer of 1875; it was recently re-located by J. O. Litten, who shortly intends to commence work to thoroughly develop it.

The convenience and facilities for developing these mines are all that could be desired. Wood and water in abundance, ease of access from railroad and good roads to all of the mines already built. Lumber and mining timbers can be laid down at the mines for \$16 per thousand feet, and round pine, mining timbers at about half that price. The altitude of the mines is 1,470 feet above sea level, and they are so situated that they can be drained to a depth of 500 or 600 feet at comparatively small expense. That these mines have true merit is fully demonstrated; it is an immense property and requires a comparatively small outlay of capital to put them into a self-sustaining and dividend-paying condition; the ledge has been prospected to a depth of 50 feet for a distance of nearly a mile, and averages a thickness of two to twelve feet, and ore has been milled from all portions of the ledge, the general average being \$10 per ton. It has all the characteristics of a true fissure vein, and the ore is all rich in sulphurets, bearing gold and silver, which if properly saved and worked, I am satisfied would pay all reasonable expense of mining and milling the ore, and would leave the free gold the ore carries as a clear profit. Taking into consideration the immense ore body, the facilities for cheap supplies and transportation, abundance of wood, water and cheap lumber, and its convenience to railroad, it makes it one of the most desirable mining properties in the State, and only requires to be in the hands of energetic mining men, with means to properly develop it, to rank it among the best paying mines in the State.

The property is principally in the hands of poor men who have not the means to develop their claims, but who are willing to give mining men with capital a liberal show to furnish the means of prospecting and opening up their claims; or they will sell out at reasonable prices. No fancy prices are asked, and parties in search of desirable quartz mines would do well to come and see these mines, as they will hear inspection. There are other mining claims in this vicinity.

## Tuscarora.

A Virginian, who has just returned from Tuscarora mining district, gives the *Enterprise* a few items in regard to what is being done and what is to be seen thitherward.

### The Town of Tuscarora

Contains from 700 to 800 inhabitants. It is a very lively little camp, reminding one of new mining camps in the early days of California. Particularly is this the case on Sundays, when men charge up and down the streets on hacking mustangs, riding through lumber piles and mortar beds, and into saloons. Our Virginian saw one fellow attempt to ride into a saloon, when his head struck a post and he was tumbled backward into the street, where he was at once gobbled up by the sheriff.

### Mines and Mills.

Both the Grand Prize mills are running—one (the old) is of 10 and the other of 20 stamps. The De Fries company have their hoisting works in operation and are building a 20-stamp mill. The Hornet company are putting up hoisting works and have their engine on the ground. William Clark, broker of this city, with others, has bought the Navajo mine, and extension of the Hornet. The price mentioned on the ground is \$17,000. Several companies are engaged in putting up small hoisting works, in which will be placed donkey engines.

### Buildings, Prices, Etc.

A good deal of building is going on in Tuscarora. One two-story brick building has been completed. It is 28x60. The first floor will be occupied as a saloon and the second as a club room. A large frame building is also being erected for use as a club room.

Common lumber sells at \$60 and sugar pine at \$100 per thousand; redwood shingles sell at \$8 per thousand.

The distance from Elko to Tuscarora is 50 miles, which is made in nine hours. Fare between the two points, \$7.50. Meals at Tuscarora, 50 cents.

### Stewart's Ranch.

Prof. W. Frank Stewart has (in partnership with Governor Bradley) taken up a ranch near the town of Tuscarora. He has built a house on the ranch and considers himself fixed. He has got the geology of the country by heart, and is ready to give all comers full information in regard to the mines of all that region.

The country is full of ledges. These have been located, and the owners have sunk small prospect shafts on them, and are holding them to sell.

### Game and Fish.

It is about 46 miles from Elko to the Owyhee river, a stream in which both brook and salmon trout abound. About the Owyhee are also to be found immense numbers of sage hens. The young ones are now of just the right size for the table. They come quite close to the road.

THE heading of the Burleigh tunnel, now 2,200 feet into Sherman mountain, is progressing at the rate of two feet per day. The air-compressors have been overhauled and are doing better work than before. The shaft sunk from the tunnel level on the Big lode (supposed to be the Mendota) is still in good ore and 45 feet deep. A level will soon be run west, which will probably open a valuable block of ground, as this forms the continuation of the ore course above, which produced \$45,000.—*Georgetown Courier*.

## Progressive Mechanism and Fairs.

The height of human glory is elevation by accomplishing the greatest amount of work with the least of physical labor, that the brain may become the operative power instead of the hand. In former years the hardy reaper wiped the sweat from his fevered brow, and ever wet his scythe with a wish that relief from such arduous labor would come to him. The progressive mechanic heard the wish, and to-day the modern reaper moves over the field "as a thing of life," performing the duty of more than two score of hands. Steam power has performed its miracles, until its combined benefits is equivalent to the support of seventy-five millions of people daily.

Thought too, by the artisan's instruments, is made to travel with lightning speed annihilating time and space, and allowing the accomplishment, often of vast labor in a moiety of toil and time—thus allowing the active worker to accomplish more in a single generation than could possibly have been done in a century prior to 1800. Thus without comment further, we may say progressive mechanism, walking hand and hand with the arts and sciences, becomes the grand promoter of human happiness, and it thus behooves every mechanical mind to look about him and think—think for the accomplishment of something in advance of the present. Plodders in the old furrows of time have an easier world to live in, but it is the thinking, active progressiveness, of the mechanical mind which covers the age with glory. One of the greatest promoters of mechanical advancement, is the congregation of all kinds of devices at fairs.

All fairs are the workshops of thought. Men and women should patronize them with all their mechanical devices, crude or perfected; then visit—look—compare—think and improve. It must be remembered that in progressive mechanism, California holds no inferior position; in fact, rates higher, per population, than any State in the Union. Such being the case, our mountain towns are stored with men of ideas, and new machines of many kinds; all should be aggregated at these opportune times, such as our Mechanics' fairs afford. It is said, and truthfully, too, that every thought has some reality at the back of it, and that we sometimes think wiser than we know. So new things, though simple, often grow to things of merit—an idea often grows into a machine of power. How unlike ages past is the present; valuable discoveries then were held as treasured secrets, to be shown or divulged under the penalty of death. The secret of the manufacture of "Dresden porcelain" was held for 200 years. The manufacture of tin for over half a century. The first manufacturers of steel held the secret for a long period, and so with many other grand discoveries, but how is it now? He who makes one step in advance, finds protection in our laws, and profit in the largest display, and this is why we progress faster; ideas build on ideas, and we advance from them. Mechanics' fairs should thus be regarded as of untold value to the State, and should be as they ever have been, liberally patronized, and, it is to be hoped, that the coming one will be the crowning one.—*Almarin B. Paul in Fair Daily, July 31, 1877.*

MEADOW LAKE AGAIN.—One of the most promising, and yet, perhaps, of all the most delusive, of California mining excitements was that of Meadow Lake, Nevada county, or "Excelsior," as it is generally termed. The gold was there and the ledges were large and almost innumerable; also many of them afforded promising prospects by assay or the ordinary hand-mortal process, but expensive mills, with all the latest improved appliances, failed to realize their promises. The precious and base metals were so closely intermingled as to baffle the most skillful manipulators. Much inventive talent has since been displayed, and even dreams been invoked in devising new furnaces and processes for the successful working of these ores, but thus far to very little purpose. Now, however, comes another ray of hope. A Nevada county exchange says: A gentleman by the name of Mr. Crail, one of the first locators in this district, but who left shortly after, when it was discovered that none of the ledges could be made to pay unless some new process could be discovered for their successful working, after an absence of several years, returned recently from Washington Territory, and is now located at Meadow Lake. He has with him a patent on smelting works, himself the inventor, and claims through this process the ledges of Meadow Lake can be made to pay good dividends. Frank Pauson, of Truckee, one of the heavy mine owners in this district, has furnished Mr. Crail with the necessary means to construct and put his smelting works in working order. We hope Mr. Crail's process will do all that is claimed for it, and, if it does, Meadow Lake will be a second Virginia City.—*Record-Union*.

THERE are 200 stamps in operation in the Deadwood mines. The ore runs on an average \$30 per ton. Three men can take out enough ore to run a common 15-stamp mill 24 hours. The scale of prices established for crushing ore by the different mills is \$80 per cord—eight tons of ore.—*Georgetown Courier*.

SOUNDING BRASS.—The composition of Chinese gongs has been found by the analysis of many specimens to be as follows: Copper, 82.00 parts; tin, 17.00; iron, 1.00; nickel, traces. The last-named metal can only be discovered by operating upon several grammes of the alloy.

## All the World for American Mechanics.

I saw by the papers some weeks ago that you were going to give us another FAIR DAILY this year, and for one, or more, I am glad of it. I say for one or more, for I found last year that my wife used to take pleasure in reading the FAIR DAILY after we had come home from the Fair.

This was not what I set out to write, but the thought is proper enough perhaps. I began to say that I had a chance to read a paper from the old country the other day, and would you believe it, there was a whole column of writing to show that Americans were beating English mechanics all to pieces in selling their machines and tools to outside countries, which have formerly bought all their iron manufactures of England. It was a queer thought to me, for when I last breathed the smoke of Sheffield, there was no more thought that anything decent could be made out of iron in America than in Greenland. I cannot remember all that the English paper said about the things which were now pushing their own out of the foreign markets, but it was, just as I say, a full column of tacks and tracks and hacks and packs and picks, made in this country and going across the water to bump the noses of English manufacturers. I remember there were thousands of plows and reapers going all over, from Scotland to Capetown, and from Brazil to India. Then there was a whole cargo of locomotive engines and cars going to start a railway in Brazil. This is nothing compared with the full list but it will show what I mean. It is, that now American mechanics have gained a point which they hardly had reason to hope for so soon, and now it behooves them to go ahead and keep up the success which they have gained.

That is what I want to talk about briefly, and I have been longer getting to my subject than I shall be in getting through with it. We mechanics have got to push ourselves forward if we hold what we have already gained and get more. This hammering away with muscle, and leaving all the brain work to be done in the office or the master mechanic's room, will not advance us a peg. If we only wake up and put ourselves in possession of every ray of light which falls across our pathway, we shall soon see that we are masters of the occasion, and not slaves to it. Now I believe in mastery which comes from real merit and practical success. I don't ask that I shall be put up or down by dishonorable means, but that, by so using the force of union as to advance our understanding of the matters which affect us, we shall be able to act intelligently and work effectively for our own good. And if we awake to this possibility in us, we shall also perceive new chances in the work in which we are engaged by day. All machines are as yet imperfect. I have often noticed, in reading pieces about engineers' reports on different machines, etc., how much power is lost in the mere turning of the machine—power which never comes to do effective work. Every improvement which is introduced to save some of this lost power will be so much gain to the world and to the mechanic who shows the way to save it. Then we need better adaptation, in many machines, to the work to be done by them.

It is because American mechanics have made much progress in these and other directions of mechanical improvement, that our manufacturers find they can drive the English manufactured goods out of many markets. It is because we have succeeded in putting more brains into our machines. It is because some of our mechanics have kept their eyes open as they worked, and after they left the benches and the lathes. It is because they kept their heads at work with something more profitable than ward politics. It is because they succeeded in showing new signs of the victory of mind over material.

I would say to my fellow-workers who can get an evening once in a while to spend at the Fair, or who, better still, can get a season ticket and come nearly every evening, let us make this Fair of some practical value to us. Do not let us walk around without a thought of what is near us. I have always found it of great good to me to take a friend of mine, who is working in the same kind of work as I am, and then we can talk over things together. When we come to something that is shown as an improvement in our line we can discuss it, and our two minds are always better than one in getting at the good and bad points about a new thing. Ho and I have several times seen things which suggested still better improvements, and you may hear from us through the Patent Office hereafter long.

As I said before it devolves upon us young and active mechanics to sustain the advance which our fathers and friends have already gained in pushing the name of "American mechanic" into honor. Let us go to work for still greater progress, so that we may be true to the general advancement of the world. We don't have time to compare views and to see what other hands can do when we are at our hoes and forges. Let us make the Mechanics' Fair the grand place for profitable intercourse. Let us make it a sort of mechanics' school, for the study of all mechanical principles and embodiments which may be shown. Knowing that the FAIR DAILY will help us to an understanding of all the things on exhibition this year we hope you every success with your publication. —Cold Chisel in Mechanics' Fair Daily.

## Getting Money.

The most unfortunate day in the career of any young man, is the day on which he fancies there is some better way to get money than to earn it; for from that feeling spring the many extravagant and visionary schemes which are indulged in for the purpose of gaining a livelihood without labor. When a young man once becomes thoroughly infected with this feeling he is ready to adopt any means for the accomplishment of his object; and if his plans are frustrated, and he is foiled in his efforts, upon the very crest of the wave which he has already mounted, and in full view, is the temptation to crime, to shield him from disgrace, which he thinks must inevitably follow in the wake of the defeat; to this he yields. And the first he realizes he finds himself the violator of the law, a criminal in the eyes of the community, and an inmate of a prison, awaiting trial—all brought on for the want of a little manly firmness in the outset of life to prompt him to choose an avocation in life where the penny earned would bring with it a sure reward. Then let our young men spurn the idea of obtaining money without rendering an equivalent; let them be ready and willing to occupy positions in life which will give them the best possible opportunity to develop their natural talent, and do good to others while helping themselves; in this way we shall have a nation of noble men and women, which will be a source of profit and pleasure to us and a subject of wonder and admiration to the world. —Boston Investigator.

UNSUCCESSFUL PROSPECT IN THE ELK MOUNTAINS.—The Salt Lake Tribune says: About six weeks ago a party of some 25 young men—Saints chiefly—got the gold fever and started for the Elk mountains. The most of them went from this city, and the others from Nephi. They have now returned, having been unsuccessful in their search for the precious yellow metal. It was no trouble at all to find color, but everywhere the gold was so fine that it was impossible to save it, and finally the enterprise was abandoned as useless. The weather in the southeastern portion of the Territory is exceedingly hot, especially in the valleys, where many of the party fell sick and were obliged to seek a cooler atmosphere in the high mountains. This party took the old Gunnison trail, and in their march came upon the deserted Indian camp where the Green brothers were killed last winter and had their stock driven off. The body of the younger brother was found within a few yards of the camp, in a dried up, mummified condition, with the clothing still on, and a bullet hole through the back of the head. The remains were buried by the prospectors where they were found, and a rude and simple monument erected over the spot. About 40 head of the cattle were discovered, gathered together, and are being driven to the settlements of one of the lower counties by a detachment of the gold seekers.

THE CHANNEL TUNNEL.—At a recent meeting of the French Society of Civil Engineers, the proposed submarine tunnel between England and France was discussed. It appears that, owing to the geological formation of the bed of the channel and other reasons, it may be expedient to trace the tunnel, not in a straight line, but in a curved direction. M. Larousse, a hydrographical engineer, who had been invited to attend the sitting, gave the results of some calculations which he had made to determine the amount of deviation which would be likely to take place in driving galleries starting from opposite shores so that their axis should exactly meet midway between the two shafts from which they depart. Allowing the maximum error which is at all likely to be made, either in measuring distances or in reading off angles, M. Larousse calculates that in the case of a straight tunnel the total deviation of the axis would not exceed 1.28 meters from the right line joining the two starting points. With an indirect trace, formed by straight lines starting from either end, and joined in the center by an arc of 2,500 meters in length, having a radius of 2,700 meters, the maximum deviation of the axis of the two galleries would not exceed 4.4 meters. With an indirect trace formed of five curves the maximum deviation would not be more than 8.35 meters, and therefore very slightly in excess of the width of the tunnel, which it is proposed should be eight meters.

OLD TIME IRON WORKS.—On the outlet of Sterling lakes, in the southwestern part of Orange county, New York, is still in active operation the iron works founded by Lord Sterling, 25 years before the revolution. The first anchors ever made in America, it is believed, were forged at these ancient works in 1752. The great chain which was stretched across the Hudson river to obstruct the passage of the British fleet was made at Sterling works in 1777. The chain weighed 186 tons, and was six weeks in making. It was transported in links to West Point in carts drawn by oxen. Each link weighed 150 pounds.

BODIE.—Bodie district, Mono county, Cal., and five miles from the Nevada line, is reported, by those recently there, as improving rapidly. Miners are flocking there and to Aurora and other towns in Esmeralda county, in this State, in great numbers. The mines around Bodie and Aurora are beginning to pay, several mills being in operation besides that of the Standard company. The ore is gold, and averages \$50 per ton.

MODERN SPRING MAKING.—Formerly, says the Hub, springs were made entirely by hand, but to-day machinery does all the work, except the final setting and tempering. The ears are dropped out and prepared by machinery, the steel is prepared for the ears by another machine, while still another places them in position and secures them, when they are again beated and placed in a welding machine, called a header. The steel for the outer plates is cut off by one machine and drawn out by another, and the plates known as filler—the under main plates—are also drawn down by one machine and turned by another. The spring is then taken to the setter and temperer. The plate is heated the whole length and formed to fit the preceding one by a hand-pinning process, and while still red-hot it is put in the bath or tempering vat, which is a metal tub filled with oil and resting in a wooden tank, in which there is a continuous stream of fresh water running. After tempering, the springs are refitted, put together and placed under a steam-tester, when, if perfect, they are ground, buffed and finished. The time required to make a pair of four-plate huggy springs is, at present, about three hours, or perhaps one-fourth the time required by the old-fashioned method, and, at the same time, a superior article is produced.

GOLD IN ARTIFICIAL GEMS.—Gold and its salts are employed in the preparation of artificial gems. In the artificial topaz, one grain of gold in 1,000 with 30 or 40 grains of antimony-glass has been detected. In the best specimens of the fictitious ruby we have a similar mixture, but the yellow is changed to red by remelting in the oxidizing flame of the blow-pipe. In the artificial amethyst and the Syrian garnet, there is either the purple of cassius with oxide of cobalt or fulminating gold with antimony. The perfection of some of these fictitious gems is such as to deceive many. The great crucial test for gems, their hardness, can, however, soon decide between the genuine stone and the most perfect imitation, which, after all, is nothing but colored glass.

THE SIMPLON TUNNEL.—The preliminary surveys for the cutting of the Simplon tunnel and the construction of the approaches are in course of execution. The plans were finished in the Bureau of Lausanne. The line commencing at Brigue, and which will serve as an international station at the entrance of the tunnel, has a length of 18,340 meters. The tunnel emerges at Isella, and the line advances from there to Bomo d'Assolla. The total length of the line is estimated at 46,900 meters. Near Bomo it joins the old ways, which continue the Italian lines to the station of Arona. As far as the village of Crevola the line runs along the left bank of the Boveria, but arriving at this point it crosses the river on a large viaduct.

STEAM ON CANALS.—An appropriation of \$5,000 has been made by the New York legislature to enable Mr. H. H. Baker to lay an experimental portion of his single rail propelling track along the bank of the Erie canal. The rail, which is to be elevated, is intended to act in connection with cogwheels and an inexpensive engine on each canal boat, as a substitute for horses. The machinery is simple, and a model which has been exhibited has worked well.

OAKLAND, CAL.

## NOTICE.

To JOHN HOWELL, FRANCIS SMITH and D. B. STARRATT—Gentlemen:—You are hereby notified that I have this day revoked the license given to you on the 22d day of August, 1871, authorizing you to erect the White Rotary Furnace, in Lander County, Nevada, because of non-compliance with the conditions of said license and agreement, and all your rights and privileges under said license are hereby terminated. GEO. W. WHITE.

TO THE PUBLIC.—After this date no person has authority to construct or grant to others the right to construct or use a White Rotary Furnace but myself. Neither has any party a right to make or sell any furnace with so-called improvements added thereto. GEO. W. WHITE.  
August 10th, 1877.

Continued from page 101:

clean-up averaged \$25 per ton. J. B. Pearson, Superintendent of the Pearson mill, at Central City, has made a contract with the Keet's mine to run the full 20-stamps on ore from that mine for the next 90 days. The Keet's mine has now 1,000 tons of ore on the dump, and is adding to it at the rate of 80 tons per day, with a night shift of 12 men. The dump was being enlarged yesterday to a capacity of 5,000 tons. The latest clean-up from the Keet's mine was made at Pearson's mill on Sunday from 173 tons of rock. The result was 230 ounces and 163 pennyweights, worth fully \$20 per ounce. The return is the best yet obtained from any mine, and this particular batch of ore is worked very close up to the assays.

## Idaho.

**POORMAN.**—Owyhee *Avalanche*, Aug. 11: Late reports from San Francisco state that a strong effort is being made to resume work in the Poorman, and that the outlook is quite promising. The resumption of work in the Poorman, under competent and satisfactory auspices, would be the dawn of a new era in the history of mining operations in this camp. All the recent developments in mines in the immediate vicinity of the Poorman go to prove the existence of a magnificent central bonanza below the 7th level in this mine, and it is the united belief of old and experienced miners here, based upon indications peculiar to the formation of the country, that the ledge to be tapped in the lower levels will surpass in richness anything of the kind encountered in the upper levels of the Poorman in its most palmy days.

The Poorman wears a more promising look than ever. Several hundred tons of rock can be taken out now without the performance of any dead work, and it seems certain that this mine is just entering upon a grand career of prosperity. Some 52 tons of rock were recently crushed and yielded about \$35.50 to the ton, an unsatisfactory result, and one that will probably be nearly doubled at the next crushing.

SINKING operations in the Golden Chariot are progressing favorably. An additional depth of 46 feet was accomplished in the past four weeks. At this rate the work of sinking 200 feet will be accomplished much sooner than was predicted.

ANOTHER effort will be made in a few days looking to the starting up of the Oro Fino. The property is entirely too good to remain idle.

**SUPR. TOWNSEND** reports everything looking favorable at the Empire. Teams are hauling to the Leonard mill, and another crushing will be made next week.

## Oregon.

**DITCH COMPLETED.**—Oregon *Sentinel*, Aug. 8: V. Smith came in from Elliot Creek mines on Monday and reports his ditch as nearly completed. They had about a quarter of a mile to dig, and when finished, will have an abundance of water to work, all the year round. These mines have shown a splendid prospect, and since they have the water necessary to work them with, the owners think they have struck a bonanza.

## Utah.

**SANDY.**—Cor. Salt Lake *Tribune*, Aug. 14: The long-looked-for improved sampling mill to be located here is fast approaching completion. Already the stacks and hoppers are rising.

**ALTA.**—The mines are now dry and in splendid condition, and are being worked by full forces. The machinery for the Toledo mine will soon be in running order. Several new strikes have occurred; the latest and best is the Nahov, owned by Boatman, Varney, Brough and others, from which large quantities of good ore are being shipped. There is a movement here to organize a miner's union for the purpose of increasing miner's wages.

## General News Items.

**CHOLERA** has appeared in several ports along the coast of China.

THERE is more trouble on the Texas border, caused by raiding Mexicans.

ABOUT 500 Chinamen have taken passage on the *City of New York* for Honolulu.

THE crusade against the press in France daily becomes more active and oppressive.

ACHMET PASHA, who surrendered Nikopolis to the Russians, has committed suicide.

GREAT destitution is said to prevail among the white and colored workmen of the District of Columbia.

CARS for the California street cable road are being built in this city as well as at Sacramento. The contract has been given to the Kimball Company.

FEARFUL floods are reported from Buenos Ayres, destroying millions of sheep and cattle, and rendering hundreds of families homeless.

THE Scotch shipwrights on the Clyde have agreed to refer their dispute with the masters to arbitration, and a speedy end of the great strike is anticipated.

THE employees of the Treasury Department at Washington have been informed that a failure to pay their just debts will subject them to dismissal.

TWELVE conductors of the Second avenue horse-car line, in New York, have been arrested and warrants issued for about 50 others, on a charge of "beating" the bell-punch and pocketing the proceeds of the cheat.

THE steamship *Frigorifique*, built for preserving fresh meat on long voyages, has arrived at Rouen from the river Plata with a cargo of meat in fine condition. One hundred and twelve days elapsed since she began loading.

A TERRIBLE battle was fought by General Gibbon's command and the Nez Perces on the ninth instant, resulting disastrously to the troops, who were driven back by the savages. Out of 100 in the command, 80 were killed or wounded.

OF 3,447 certificates of citizenship issued by County Clerk Reynolds in this city last year, 1,502 were given to natives of Ireland, 343 to natives of Germany, and 306 to natives of Prussia. During the year 1,407 declarations of intention were made.

MR. JAMES STEVENSON, of the Geological Survey, who accompanied the scientific party on the way out from the East, called on us this week. He returned East on Friday.

WOODWARD'S GARDENS has the following new attractions: The buffalo chase; large whale skeleton; new museum; improvements in the zoological department, besides the other features which have made it popular.

## PATENTS AND INVENTIONS.

## A Weekly List of U. S. Patents Issued to Pacific Coast Inventors.

(FROM OFFICIAL REPORTS FOR THE MINING AND SCIENTIFIC PRESS, DEWEY & CO., PUBLISHERS AND U. S. AND FOREIGN PATENT AGENTS.)

By Special Dispatch, Dated Washington, D. C., July 24th, 1877.

FOR WEEK ENDING JULY 31ST, 1877.

- 193,685. CLACK VALVES FOR PUMPS.—William C. D. Body, Virginia City, Nev.  
193,687. SECTIONAL CHIMNEYS.—Jeremiah Brownell, S. F.  
193,722. FILTERS AND COOLERS.—Jordan Peter, of Petaluma, and Thomas C. Walter, S. F.  
193,757. TRAMWAY TRACKS FOR WIRE-ROPE RAILROADS.—William Eppelsheimer, S. F.  
193,761. LIQUID MEASURES.—Lucien B. Healy, S. F.  
193,773. SAFETY HOOK.—William E. Murray, Ukiah, Cal.  
193,787. DUST TRAPS FOR FURNACES.—Thomas J. Taylor, Eureka, Nev.

## LARELS.

LABEL FOR MOODY'S CONCENTRATED FLUID EXTRACT OF SASSAPARILLA, STILLINGIA AND YELLOW DOCK.—John C. Moody, S. F.

—The patents are not ready for delivery by the Patent Office until some 14 days after the date of issue.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by telegraph or otherwise) at the lowest rates. All patent business for Pacific coast inventors transacted with perfect security and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS American and Foreign Patent Agency, the following are worthy of mention:

**CLACK OR VALVE FOR PUMPS.**—Wm. C. D. Body, Virginia City, Nev. This invention relates to certain improvements in the construction of pump-valves, or clacks, as they are commonly known, and it consists in a novel method of forming a face of wood upon a metal valve, so as to make a tight joint of material which can easily be replaced whenever desired. The valves of large mining and other pumps are usually made of iron, and have a leather face properly secured to form the joint when the valve is closed. This leather face forms a tolerably good joint when used in cold water, and is only open to the objection of rapid wear; but in deep mines hot water is encountered, and the wear of the leather is then so rapid that a set of valves will only last a short time, sometimes only a few hours, causing great delay and expense to replace them. This inventor employs a series of rubber, wooden or other blocks, which are sawed off to a certain size, and have one end cut so as to diverge or form a dovetail. The valve or clack is made of iron, with a hinge at one side in the usual manner. In the face of this valve is turned a groove, which is made broader at the bottom than at the top, so as to receive the dovetail-shaped blocks. A slot is cut in the face of the valve, connecting with the circular groove at one point, and through this slot are introduced the blocks, they being moved around in the groove until the whole space is filled. The last block fills the space opposite the slot, and a block just fits this slot and is held in place by a screw, thus firmly keying all the blocks in place and preventing them from coming out. The blocks are preferably made of hard wood, with the end of the grain outward, and projecting somewhat—say three-fourths of an inch—from the surface. This gives a face that will last for months and make a perfectly tight joint, at much less expense than the leather.

**IMPROVEMENTS IN SECTIONAL CHIMNEYS.**—J. Brownell, S. F. The improvement relates to such chimneys as are composed of tubular sections, either single or double, placed upon one another, and secured in place so as to form a continuous flue. In putting together a chimney of this kind it is necessary to protect and cover the joints permanently, and to stay the meeting ends of the sections, so that they will not be displaced by shocks or jars. This is especially necessary in a country which is subject to earthquakes, and where the building in which the chimney is constructed is liable to settle, as the slightest disturbance of a long chimney thus constructed is liable to displace the sections and open the joints, so that the flue becomes dangerous, on account of the liability of sparks escaping through the cracks or open joints, and setting fire to the house. Mr. Brownell's latest invention provides what he calls a combined joint band and diaphragm, which is so constructed that it embraces the joints closely and stays the ends of the sections in place by serving as a brace to keep the joints in their proper relative positions.

**FILTER AND COOLER.**—Jordan Peter, Petaluma, and T. C. Walter, S. F. This is a novel arrangement of a water cooler and filter for supplying pure cool water to houses for drinking and other purposes. The chief feature of the invention is a subterranean cooling vessel, which provides a cheap, simple and effective device for preserving a uniform temperature in combination with the above-ground filter.

THE decision in the Eureka Consolidated suit against the Richmond will be given on Monday, August 20th.

## Fairbank's Scales.

An important advantage to be gained by the exhibition of manufactures in the fair is the making known to our people the results of ingenuity that is practical. The plan embodies the idea that those men are the successful competitors for public favor by whose invention and enterprise the world receives the most positive benefit. For this purpose of the exhibition he who teaches us to save time and labor, and to practice true economy in regard to what we use and what we do, is the man to gain laurels. In this connection we cannot forbear speaking at some length of Messrs. E. and T. Fairbanks & Co., manufacturers of the celebrated Fairbank's scales, St. Johnsbury, Vermont. For a long series of years the Fairbanks Company has sought out new inventions and applied its unequalled facilities to the making and furnishing the most accurate weighing apparatus, in the most numerous variety of pattern and style. It makes scales that will justly weigh anything and everything, suitable for and adapted to the systems of all countries.

It is a literal fact that the Philadelphia Exposition was weighed upon their scales, buildings and merchandise, a Fairbank's track scale having been placed on the grounds by the contractor, and all the material for all the buildings was weighed upon it. Goods that were received for exhibit and articles taken or given out by terminal agencies were weighed on Fairbank's scales.

The value of a scale consists in its being correct in the beginning, and, in despite of use, remaining so. The records of stores show that one of these scales had been in constant use for thirty years, without repairs, and yet turns quickly, and stands the test of the official scaler. The records of the manufacturers show that this scale was made in 1833, and has been in use thirty-three years, and without repairs. The present shop number of that class of scale is over 278,000.

We name another instance of accuracy and service, that of a Fairbank's railroad track scale that has been in use by the Lehigh Valley Railroad, and which has weighed 24,000,000 tons of material—often 60,000 tons per day—and has never required repair in any particular. These track scales are from fifteen to one hundred and twenty-five feet or more in length, and a loaded train may slowly pass over one of them, and each car, without uncoupling, be weighed without loss of time.

The company have a process for the making of steel that is as keen as a razor blade upon its edge, and tough as Norway iron. The use of this insures the utmost delicacy of action in the balance and power of resistance to heavy weights. The greatest care is given to the finish of all the working parts of its scales; they are sensitive and durable throughout; they strain upon them, when weighing, is distributed over the levers properly placed in most exact position to insure this result; everything used in their make is of the best quality, and the American system that details interchangeability of parts is adopted in its great factory, all parts of its numerous varieties of scales being made to standard gauges, so that any part of any scale being lost or broken may be at once replaced.

That the Messrs. Fairbanks have studied the interests of the place in which their very extensive works are located is proved by the handsome Athenaeum building, containing a choice library of about 8,000 volumes, a reading room with the leading papers and periodicals, and a handsome lecture hall; by the substantial schoolhouses and other public buildings, and by other evidences of thrift and taste, and means for culture such as few towns of 5,000 inhabitants can boast. The reading room and library are free to all.

A few statistics concerning this immense business may be of interest.

The company gives employment to nearly 900 men. The shops, built of brick cover a flooring of 6½ acres. They have 93 tenement houses, run their own saw-mill, and own 6,000 acres of timber lands. They consume 4,000 tons of coal annually, using 5,000 tons of iron, 2,000,000 feet of lumber, and large quantities of copper, tin, nails, screws, etc. Their annual freightage is 20,000 tons, and the factory product is 50,000 scales yearly.

They hold 28 patents upon scales and scale machinery, many of them of recent date, and new patents on recent improvements are being applied for, while their position as the largest scale manufacturers in the world has been gained and is held, not by force of their patents, but by strict adherence to their principle to allow only perfect goods to bear their name. The company has a world-wide reputation to maintain, and it is entirely safe to assert that all improvements in designs for needed purposes have been or will be adopted as soon as found to be of real worth.

In the exchange of nearly all commodities weighing is of primary importance, and only the most perfect and accurate weighing apparatus can safely be used. Herein, with especial regard, the motto, "Quality is the test of cheapness," has been acknowledged by the whole weighing world.

It is of the greatest consequence to the com-

munity that such a house leads in the manufacture of articles so essential to every-day life. It exerts a moral influence for good. The manufacturer is proud of the product that he can guarantee in every regard, and the purchaser is satisfied in the possession of a property the intrinsic truth and value of which no one disputes. —*Mechanics' Fair Daily.*

MERCED, July 8, 1877.

Messrs. DEWEY & Co.—Gentlemen:—It is with no small  
degree of satisfaction that I acknowledge the receipt of  
the letters patent for my invention, "The Moth Trap Bee-  
hive," in yours of July 3d. You will please accept my  
highest appreciation and kindest regards for the skillful  
and expeditious manner with which you have prosecuted  
my patent. I have the most unbounded confidence in  
your integrity as gentlemen of high moral principles, and  
to your efficiency in all your departments of business, and  
I will hereby cheerfully recommend all who wish to ob-  
tain letters patent, to employ without delay, Messrs.  
Dewey & Co. You may rest assured that my business,  
should I have any more in your line, will be transacted  
through you. Yours truly,

THOS. A. ATKINSON.

There are many persons who do not know how to stop  
a newspaper. They are more awkward about it than a  
country boy stealing his first kiss. The way to do it with  
satisfaction to both sides is to address the publisher by  
letter if you do not live near enough to call at his office.  
It is no way to notify the postmaster or some one else.  
Four postmasters in three will fail to notify the office of  
publication. They look upon it as your business more  
than theirs. The right way is as gentle and pleasant as  
the other is suspicious and shabby. If you owe for a few  
weeks or months or over time, tender the amount due.  
It is a little thing, but it will be a great satisfaction to  
your conscience, as every one is presumed to have one of  
some kind. Stop your newspaper like a man, and your  
own self-respect and the esteem of the publisher is main-  
tained. Then you can always look him in the eye or take  
him by the hand, and he will feel proud to think you were  
once one of his most gentlemanly patrons, and wish you  
would subscribe again.—Exchange.

WOODLAND, CAL., Aug. 8th, 1876.

Messrs. DEWEY & Co.—Gents:—Your letter contain-  
ing patent for my Centennial churn has come duly to  
hand, and you will please accept my many thanks for the  
prompt manner in which you attended to the business in-  
trusted to your care, and I will take great pleasure in re-  
commending you to any one having anything to attend to  
in your line. I am having a number of the churns put up,  
which will be ready for sale in a few weeks.  
Yours truly, JAMES ROOT.

SANTA CLARA, CAL., April 6th, 1875.

Messrs. DEWEY & Co.—Gents:—We have just received  
Patent No. 160,535, for J. T. Watkins & Co.'s Mammoth  
Road Grader, which was patented through your Agency.  
It is the nearest and best that we have ever received. We  
feel proud of it and thankful to you for the care and at-  
tention that you have given it, and when we have any-  
thing to do in that line of business, we will surely give you  
a call. Very respectfully, J. T. WATKINS & CO.

APPRECIATION ABROAD.—We copy the following from the  
Mining and Monetary Gazette, of London, England: "We  
deemed it advisable, as affording valuable information to  
our readers, to publish in recent issues of The Gazette,  
the full text of the 'United States Mining Laws and In-  
structions, by the Commissioner of General Land Office,'  
taken from our talented contemporary, THE MINING AND  
SCIENTIFIC PRESS, of San Francisco. The documents have  
now been issued in a handsomely bound volume by  
Messrs. Dewey & Co., the publishers of our transatlantic  
contemporary, and it will be found very useful to those  
already interested in American mines, and to others who  
may be tempted to embark in that enterprise in the  
States."

Facts for Pacific Coast Inventors.

MINING AND SCIENTIFIC PRESS  
PATENT AGENCY, S. F.

Our reputation as Patent Solicitors has been  
obtained by long experience, painstaking in our  
work, and fair dealing with our clients. We  
charge reasonable fees and do our work well.  
We charge for each case according to the amount  
of work involved. Our cases are prepared by  
members of the firm who have been in the busi-  
ness over twelve years, and we do not intrust  
the preparation of cases to boys or employees.  
A firm that employs boys at five and six dollars  
per week to write specifications, can afford to  
advertise and take cases at a uniform rate of \$20  
or \$25 a case, but the inventor does not usually  
find it the cheapest plan to employ such aid. If  
it is worth a hundred dollars to prepare a case  
and secure a patent, we charge a hundred dol-  
lars. If we can afford to do the business for  
twenty dollars, we only charge that much. A  
blacksmith might as well advertise that he will  
do all kinds of jobs from the shoeing of a horse  
to the ironing of a wagon for one price, as for a  
patent solicitor to say that he can prepare and  
prosecute all kinds of cases (and do them right)  
for any one fixed price. It is not common sense.  
And if we were the inventor we should at once  
distrust the agent who made us the proposition.  
We would think that he was in the habit of  
slighting his client's work. If a person will  
send us his model, so that we can see what we  
have to do, we will tell him what we can do his  
work on that case for, and we always satisfy  
our clients. We have succeeded in securing the  
patronage of every inventor who has taken his  
work from Eastern agents and given us a fair  
trial. We do the work better and more  
promptly. The inventor can come and see us  
and explain matters orally, if an explanation is  
required, and if we make a mistake or fail to  
do our duty, he can always reach us with a  
"long-enough pole."

DEWEY & CO.,  
202 Sansome street. S. F.

To Mining Secretaries.

An amendment to Section 336 of the California Code,  
taking effect July 1st, 1874, provides that in addition  
to the regular publication, daily or weekly, of the assess-  
ment and sale notices as heretofore,

PERSONAL NOTICE

Must be served as provided in the following quotation  
from the law:

"The notice must be personally served upon each  
stockholder, or in lieu of personal service, must be sent  
through the mail, addressed to each stockholder at his  
place of residence, if known, and if not known, at the  
place where the principal office of the Corporation is sit-  
uated."

The above refers to the ASSESSMENT NOTICE only.  
Advertisers in the MINING AND SCIENTIFIC PRESS  
will be furnished with copies of assessment notices printed  
on slips suitable for serving personal notice under this  
law at short notice.

DEWEY & CO., Publishers.

Mining and Other Companies.

Persons interested in incorporated shares  
will do well to recommend the publication  
of the official notices of their companies  
in this paper, as the cheapest appropriate  
medium for the same.

Bella Union Quicksilver Mining Company.

Location of principal place of business, San Francisco,  
California. Location of works, Napa County, California.  
Notice.—There are delinquent upon the following de-  
scribed stock, on account of assessment No. two (2), levied  
on the twenty-eighth day of June, 1877, the several  
amounts set opposite the names of the respective share-  
holders, as follows:

## Iron and Machine Works.

**PACIFIC ROLLING MILL COMPANY,**  
SAN FRANCISCO, CAL.

Established for the Manufacture of  
RAILROAD AND OTHER IRON

Every Variety of Shafting,  
Embracing ALL SIZES of

Steamboat Shafts, Cranks, Piston and Connecting Rods, Car and Locomotive Axles and Frames,

Hammered Iron of Every Description and Size.

Orders addressed to PACIFIC ROLLING MILL COMPANY, P. O. Box 2032, San Francisco, Cal., will receive prompt attention. Office: 16 First Street.  
The highest price paid for Scrap Iron.

THOS. PENDERGAST.

HENRY S. SMITH

## ÆTNA IRON WORKS,

MANUFACTURERS OF

## IRON CASTINGS

and MACHINERY

OF ALL KINDS.

Fremont Street, Bet. Howard and Folsom

SAN FRANCISCO.

## THE RISDON

Iron and Locomotive Works,

INCORPORATED.....APRIL 30, 1868  
CAPITAL.....\$1,000,000.

LOCATION OF WORKS:

Corner of Beale and Howard Streets,

SAN FRANCISCO.

Manufacturers of Steam Engines, Quartz and Flour Mill Machinery, Steam Boilers (Marine, Locomotive and Stationary), Marine Engines (High and Low Pressure). All kinds of light and heavy Castings at lowest prices. Cams and Tappets, with chilled faces, guaranteed 40 per cent. more durable than ordinary iron.

Directors:

Joseph Moore, Jesse Holladay, C. E. McLane,  
Wm. Norris, Wm. H. Taylor, J. B. Haggin,  
James D. Walker.

## SHEET IRON PIPE.

Risdon Iron and Locomotive Works

Corner Howard and Beale Streets,

Are prepared to make SHEET IRON AND ASPHALTUM PIPE, of any size and for any pressure, and contract to lay the same where wanted, guaranteeing a perfect working pipe with the least amount of material.

Standard sizes of Railroad Car Wheels, with special patterns for Mining Cars. These small wheels are made of the best Car Wheel Iron, properly chilled, and can be fitted up with the improved axle, and box—introduced by this company, and guaranteed to outlast any other wheels made in this State.

All kinds of Machinery made and repaired.

JOSEPH MOORE, Superintendent.

## SACRAMENTO BOILER WORKS,

37 Fremont St., cor. Mission, S. F.

## HALL & KELSLOW,

PRACTICAL BOILER MAKERS,

Marine, Stationary and Portable Boilers, Smoke Stacks, Hydraulic Pipe, Oil or Water Tanks, Ore and Water Buckets, Gasmotors, Grinders, Bridges and Iron Ship Building.

ALL KINDS OF SHEET IRON WORK.

Repairing promptly attended to at the lowest possible terms.

## STEAM ENGINES AND BOILERS

Of all sizes—from 2 to 60-Horse power. Also, Quartz Mills, Mining Pumps, Hoisting Machinery, Shafting, Iron Tanks, etc. For sale at the lowest prices by

J. HENDY, 49 and 51 Fremont Street, S. F.

Miners' Foundry and Machine Works,

CO-OPERATIVE,

First Street, bet. Howard and Folsom, San Francisco

Machinery and Castings of all kinds.

## McAFEE, SPIERS & CO.,

BOILER MAKERS AND  
GENERAL MACHINISTS,

Howard between Fremont and Beale Sts., San Francisco

## HAWKINS & CANTRELL, MACHINE WORKS,

210 and 212 Beale Street, bet. Howard and Folsom Sts., - - San Francisco.

Manufacturers of

IMPROVED PORTABLE

## Hoisting Engines,

For Mining and Other Purposes.

Steam Engines and all Kinds of Mill and Mining Machinery.

## PACIFIC IRON WORKS,

First and Fremont Streets, between Mission and Howard, San Francisco, Cal.,

RANKIN, BRAYTON & CO.,

MANUFACTURERS OF

ENGINES, BOILERS, MARINE AND STATIONARY. PUMPING, HOISTING AND MINING MACHINERY INCLUDING BATTERIES, AMALGAMATING PANS AND SETTLERS, CONCENTRATORS, ORE FEEDERS, CRUSHING ROLLS AND ROCK BREAKERS. ALSO, WATER JACKET SMELTING FURNACES, FOR REDUCING LEAD, SILVER AND COPPER ORES, QUICKSILVER FURNACES, RETORTS AND CONDENSERS, ROASTING AND CHLORIDIZING FURNACES, SUGAR MILL MACHINERY, WATER WHEELS, Etc., ALL OF THE LATEST AND MOST IMPROVED CONSTRUCTION.

Agents for the Allen Engine Governor, Cook's Boiler Feeder and Heater, Buckminster Rock Drills and Air Compressors, Wheeler's Ore Breaker, Etc.

GEO. W. FOGG, Supt.

## PHELPS MANUFACTURING COMPANY,

Manufacturers of all kinds of

Wharf and Bridge Bolts, Railroad Trestle Work, Car Frames and Bolts, Machine Bolts, Set Screws and Tap Bolts, Lag or Coach Screws.

ALL STYLES OF FANCY HEAD BOLTS. HOT AND COLD PRESSED HEXAGONAL AND SQUARE NUTS, WASHERS, BOLT ENDS, TURNBUCKLES, ETC., ETC.

13, 15 & 17 Drumm St., near California,  
SAN FRANCISCO, CAL.

## THOMPSON BROTHERS, EUREKA FOUNDRY,

Light and Heavy Castings of Every Description Manufactured.  
Sole Proprietors and Manufacturers of  
Lynch's Ventilating and Illuminating Tile,  
The Only Illuminating Tile Manufactured for Light-  
ing Cellars, Basements and Dark Rooms which pro-  
vides proper ventilation for such places.

129 and 131 Beale Street,  
BET. MISSION & HOWARD, SAN FRANCISCO

## CALIFORNIA BRASS FOUNDRY,

No. 125 First Street, Opposite Minna,

SAN FRANCISCO, CAL.

All kinds of Brass, Composition, Zinc, and Babbitt Metal Castings, Brass Ship Work of all kinds, Spikes, Sheathing Nails, Rudder Braces, Hinges, Ship and Steamboat Bells and Gongs of superior tone. All kinds of Cocks and Valves, Hydraulic Pipes and Nozzles, and Hose Couplings and Connections of all sizes and patterns, furnished with dispatch. PRICES MODERATE.  
J. H. WEED. V. KINGWELL.

## California Machine Works,

119 BEALE STREET, SAN FRANCISCO.

## BIRCH, ARGALL & CO.,

Builders of QUARTZ, SAW AND FLOUR MILLS,

Keating's Sack Printing Presses,

THE ECONOMY HYDRAULIC HOIST FOR STORES,

And General Machinists.

## Machinery.

## The Ingersoll Rock Drill

Is Extensively Used in the East and

TAKES THE PLACE OF ALL OTHERS,

Wherever introduced, because it can be run with less power, labor and repairs, and do more work than any other drill in the market. It has but few parts, is easily handled, being light, and has AUTOMATIC FEED, which saves labor. WE ASK FOR TRIAL AGAINST ANY COMPETITOR. For particular information regarding Drills or Air Compressors, send for circular to

J. B. REYNOLDS,

(Room 10, 320 Sansome Street

## The Gardner Automatic Governor.

MORE THAN TEN THOUSAND NOW IN USE.  
EVERY ONE WARRANTED.

SEND FOR DESCRIPTIVE CIRCULAR AND PRICE LIST.

When all others fail, buy a "Gardner." We have all sizes of these celebrated Steam Governors on hand at all times.

BERRY & PLACE,

Selling Agents for the Pacific States,  
Cor. Market & Fremont Sts., S. F.

## THE O'HARRA CHLORIDIZING FURNACE

Guaranteed to Chloridize from 85 to 95 per cent. of any gold or silver ores that are not ready for smelting. Will also desulphurize ores and put them in proper shape for working in cupola furnaces.

Cost of Roasting and Chloridizing 20 Tons in 24 Hours by this Process:

One man.....	\$ 4 00
One man.....	3 00
Wood—23 Cords at \$3 per cord.....	5 25
Salt—1,600 lbs at 2 1/2 cents.....	40 00

Cost of 20 tons.....	\$52 25
Cost of one ton.....	2 61 1/2

In a furnace of three or four times this capacity the cost is decreased by 20 per cent.

The furnace is now working successfully at the Poe Consolidated Co.'s mines, in Peavine District, Nev., and at the Eschequer mill, Alpine Co., Cal. For further information, apply to

D. J. O'HARRA,

## LIFE INSURANCE CLAIMS.

The Supreme Court of New York State has decided that the law allowing six months over from the date of first publication of Receivership must be complied with, and that it would not be sufficient to file a claim after that time, even if done before the payment of the second dividend. Therefore, claimants must take prompt action in order to protect their interests, because in some instances the time allowed has nearly expired.

James Munsell, Jr., has established special facilities in the East for presenting in due form and collecting all kinds of claims on policies in Eastern Life Insurance Companies in liquidation. It is a matter of great importance that claimants should place their policies only in the hands of persons of experience in the insurance business, in order that their policies may be properly valued and their interests efficiently as well as faithfully represented. Appreciating this fact, several attorneys-at-law in San Francisco and elsewhere have placed the claims of their clients in the hands of this agency for presentation with the Courts and Receivers in Eastern States.

Parties who have only partially filed their claims by correspondence with the late Receiver, Grace, who has been superseded, (and the case of Hoyt vs. the Continental entirely set aside because illegal), may find it desirable to have their claims presented in due form through this agency with Receiver O'Neill, in the new suit brought by the Attorney-General. Parties filing claims through this agency will be relieved of all further trouble, and final settlement will be made with them at this office on the first, second and third dividends, as fast as made by the Receivers.

For the direction of claimants who are unacquainted with these matters, special reference is made to the Agents and Managers of the principal Life and Fire Insurance Companies in San Francisco. Correspondence from the interior will receive prompt attention.

Office, 224 Sansome Street, corner of California, over the Bank of British Columbia, San Francisco.  
N. B.—One of the publishers of this journal has, with confidence, employed Mr. Munsell to collect his claims against the Continental Life Insurance Company of New York.

## Buy the Best.

Before purchasing an American Watch, examine the different styles manufactured by the NEW YORK WATCH COMPANY, at Springfield, Mass. They are the latest and best improved manufacture. You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in fact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

DEWEY & JORDAN, Agents,  
433 Montgomery St., S. F.

## CAUTION TO HYDRAULIC MINERS.

All persons, excepting those having the right by purchase from me, are hereby cautioned against using, or making, or selling any device for turning the discharge pipes of hydraulic machines which uses the deflecting force of the stream of water.

Any such device is an infringement of United States Letters Patent, granted to me on the 16th of May, 1876, and re-issued September 10th, 1876.

I have commenced suit against Richard Hoskin for infringing my said patent, and intend to prosecute all parties using such Deflectors without license from me, there being no other way to protect my rights.

Any parties wishing to purchase the right to use this device can do so by making application to me.

HENRY C. PERKINS,  
North Bloomfield, Nevada County, Cal.

## Diamond Drill Co.

The undersigned, owners of LESCHOT'S PATENT for DIAMOND POINTED DRILLS, now brought to the highest state of perfection, are prepared to fill orders for the IMPROVED PROSPECTING AND TUNNELING DRILLS, with or without power, at short notice, and at reduced prices. Abundant testimony furnished of the great economy and successful working of numerous machines in operation in the quartz and gravel mines on this coast. Circulars forwarded, and full information given upon application.

A. J. SEVERANCE & CO.  
Office, No. 320 Sansome street, Room 10.

## \$1,000 Challenge Ore Feeder,

AWARDED FIRST PREMIUM

At the Tenth Industrial Fair of the Mechanics' Institute.

It may be considered as now fully demonstrated, by careful and long-continued experimentation, that the plan upon which a perfect ore feeder must be constructed is that of the carrier, and not that of the shaking table. Uniform and accurate feeding is not possible upon the latter plan. The ore must be evenly carried, upon a steadily advancing plane or table, to the line of discharge, and there simply dropped. Spasmodic or jerky contrivances will not answer the purpose.

We warrant the machines to give perfect satisfaction, and to be a better and more durable Feeder than any other in the market, and will sell them as cheap as any other of its class.

BY GUIDO KUSTEL,  
MINING ENGINEER AND METALLURGIST.

Roasting of Gold and Silver Ores, and the Extraction of their respective Metals without Quicksilver. 1870.

This rare book on the treatment of gold and silver ores without quicksilver, is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and explains the why wherefore.

It contains 142 pages, embracing illustrations of furnaces, implements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$2.50 coin, or \$3 currency, postage free.

Concentration of Ores (of all kinds), including the Chlorination Process for Gold-bearing Sulphurets, Arsenurets, and Gold and Silver Ores generally, with 120 Lithographic Diagrams. 1867.

This work is unequalled by any other published, embracing the subjects treated. Its authority is highly esteemed and regarded by its readers; containing, as it does, much essential information to the Miner, Metallurgist, and other professional workers in ores and minerals, which cannot be found elsewhere in print. It also abounds throughout with facts and instructions rendered valuable by being clearly rendered together and in simple order. It contains 120 diagrams, illustrating machinery, etc., which alone are of the greatest value. PRICE, \$7.50.

Contents of Pamphlet on Public Lands of  
California, U. S. Land Laws, Map of

## Questions of the Times.

Which are the most reliable watches?

American watches, they are driving those of foreign make out of the market.

Which is the best American watch?

The New York watch, made at Springfield, Mass.

Why is it the best watch?

Because it is substantial in all its parts, constructed on the best principles and embodies those improvements which experience has shown to be the most desirable.

Why is the New York Watch so popular?

Because in buying one you are sure of getting a good time-keeper. While purchasing a watch of most other makes is like investing in a lottery—a great many blanks to one prize.

Which is the cheapest watch?

The most economical is the New York watch. For you can get one of these excellent time-keepers for less than it costs in a short time to patch up a poor watch, which benefits no one but the repairer.

Where can I get a New York Watch?

By addressing the long established, practical Watch-makers and Jewelers, DEWEY & JORDAN, 433 Montgomery St., San Francisco, who will send you a descriptive price list, including the following styles of movements: "John Hancock," "Geo. San. Rice," "Chas. E. Hayward," "Aaron Bagg," "Theo. E. Studley," "Chester Woodworth," "Frederick Billings," "Railway," "John L. King," "E. W. Bond."

## UNITED STATES

Mineral Land Laws, Revised Statutes, AND INSTRUCTIONS AND FORMS UNDER THE SAME.

We have just issued a pamphlet containing the General Mineral Land Laws of the United States, with instructions of the Commissioner of the Land Office. The contents of this pamphlet comprise all of the Government laws with relation to mineral lands of interest to the mining community, as follows: Mining Statute of May 10th, 1872, with instructions by the Commissioner of the Land Office; Mining Statute of July 26th, 1866; Mining Statute of July 9th, 1870. Forms required under Mining Act of May 10th, 1872, as follows: Notice of Location; Request for Survey; Application for Patent; Proof of Posting Notice and Diagram of the Claim; Proof that Plat and Notice remained Posted on Claim during Time of Publication; Register's Certificate of Posting Notice for Sixty Days; Agreement of Publisher; Proof of Publication; Affidavit of \$500 Improvements; Statement and Charge of Fees; Proof of Ownership and Possession in Case of Loss or absence of Mining Records; Affidavit of Citizenship; Certificate that no Suit is Pending; Power of Attorney; Protest and Adverse Claim; Non-Mineral Affidavit; Proof that no Known Veins Exist in a Placer Claim, etc. There is also given the U. S. Coal Land Law and Regulations thereunder. The work comprises thirty pages, and will be sold, post-free, for 50 cents. It should be in the hands of every one having any mining interests. DEWEY & CO., Publishers of the MINING AND SCIENTIFIC PRESS, S. F.

## OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send one but worthy men.

VOLUME XXXV.  
Number 8.

## Items of Interest from the Mines.

We give below items of interest from prominent mines, most of which are collated from letters of the respective Superintendents on file at the offices in this city:

In the Hussey Cou. mine the stopes from the 120-foot level are looking well. Ore is being hauled to the mill to free the dumps, so that the ore from the 230-foot level can be placed by itself.

The Leopard mill is running nicely, and every prospect of continuing right along. The stopes between the 5th and 6th levels are in good shape, and will yield 25 tons per day easily. Above the 4th level they are all opened out.

Operations at the Chollar mine for the week ending the 18th, show the following results: Number tons extracted, 502 400-2000; Number tons forwarded to mills, 487 700-2000. Average assay of ore mined, \$21.75 per ton.

The ledge in the New England is about two feet wide, and will pay about \$30 per ton.

The Crown Point letter of the 20th, says: The south drift, 2000-foot level, has now reached a depth of 330 feet from starting point in main east drift. This leaves us 120 feet yet to run to connect with the joint pump shaft. The ground continues hard and dry, and the drift is making good progress, having made 43 feet last week. The joint pump shaft now lacks about 40 feet on the incline of our 2000-foot level. We have partially reopened the 160, 230 and 300-foot levels. The work thus far has been chiefly clearing and straightening up old drifts, winzes, etc. At several points we have encountered small streaks and spots of ore, but as yet the work has not been advanced sufficiently to determine its extent or quality. Some of the ore is very good, though most of it is of low grade and in mixed ground, requiring considerable assorting.

The various drifts in the Eureka Con. mine are being carried forward at the usual rate, with very encouraging prospects throughout the respective levels. The 3d level drift has passed through the hard limestone formation mentioned in last report and has come into easier working ground with very good indications of ore in face of drift. The 5th level ore body is looking exceedingly well and still shows no signs of diminishing. The 6th level ore body shows some improvement over last week and is looking very well. The ore body mentioned as having been struck on the 10th level shows decided improvement, and looks as though it would prove the best body of ore ever found in the mine. The main east drift has now been advanced 100 feet since coming into this ore, with the face of drift continuing in ore. Two cross-cuts, each 25 feet long, have been run through this ore at different points, and are still in ore. The ore in drift and cross-cuts is quite rich, carrying a good percentage of lead, and making it first-class ore for smelting. The furnaces have been running well during the week, yielding upwards of 25 tons daily, and aggregating over 353,000 pounds of bullion.

In the Justice the 1150-foot level is freed from its watery element and operations resumed on the east drift, the face of which shows very fine stringers of quartz of a metal-bearing character; assays from \$3 to \$11 per ton. The vein on the 1000-foot level from south lateral drift shows a regular and well-defined body of ore containing considerable metal.

The wages on the Eureka Con. suit amount to over \$25,000.

**BULLION SHIPMENTS.**—Since our last issue shipments of bullion from prominent mines have been as follows: Grand Prize, 16th, \$13,300; Endowment, 16th, \$3,098.63—total to date, \$8,378.80; Martin White, 13th, \$12,022.63; Grand Prize, 16th, \$13,286.60; 20th, \$13,300; Leopard, 20th, \$3,600; Standard, 16th, \$25,454; Con. Virginia, 16th, \$178,368—total to date, \$276,762.27; California, 16th, \$135,756.83—total to date, \$403,723.99; Northern Belle, 14th, \$5,246.41; 16th, \$4,753; Tyho Con., 14th, \$4,068—total to date, \$7,092; Northern Belle, 19th, \$9,941.35; California, 21st, \$159,829.85—total to date, \$563,553.84; Con. Virginia, 21st, \$185,807.67—total to date, \$462,569.94.

## New Method of Making Propellor Patterns.

We give herewith an illustration of a new method of making patterns for propellers, so as to get a true screw by mechanical means, without the necessity of calculation and drafts. The new method was designed by Mr. Otto Osten, a mechanic of this city. As shown in the engraving, a number of pieces of wood are planed to the same size, and placed on a piece of iron threaded on its upper end, so that a nut may clamp them together. They are then spread out to the required pitch and marked on both ends with a pair of compasses. All the wood outside the marks is then taken off. The pieces are smoothed up, clamped and glued together, and the pattern is made. After being clamped the pattern is narrowed at the hub and rounded at the tips to make it neater.

This gives all the curves true with no guess work, as is too often the case with the method in vogue. It ought to reduce the cost of propellers, as the pattern is so simply made. Propellor patterns are the most difficult jobs to do around a foundry; a true screw is difficult to

PLAN OF MAKING PROPELLOR CASTINGS.

make, and then they are not always sure of being correct.

Several propellers have been made as samples from this style of pattern, and can be examined at the shop of E. H. Thompson, 228 Main street. After the pattern is made, before it is glued together, the purchaser may examine and see if the pitch suits him; or he can set the pieces of wood before the pattern is made and get exactly the pitch he wants. Where it is desired to have the propeller curve inwards at the tip to prevent slip, the pieces of wood are made a little thicker at the tips so that the screw can be made accurately. We have seen several of the patterns made on this principle, by Mr. Osten, all of which were very correctly made. Any ordinary mechanic can make one as it takes no scientific knowledge to prepare plans and drawings before the pattern makers take hold of the work.

The Eureka Sentinel says: Senator Sharon invested \$30,000 of his surplus capital in Eureka Consolidated shares last week, paying therefor \$36 per share. It was a private transaction, and illustrates the mining magnate's confidence in the future of the mine.

The last bar of gold, valued at \$9,000, has been shipped from the Eureka mine, to San Francisco. That completes the clean-ups. That mine has done nobly in yielding precious metal, and hundreds will regret to learn that work has been suspended on it forever.

**COPPER.**—The latest Liverpool quotations for copper are: Good ordinary brands, £68 15s. to £69; special brands, up to £70 per ton; ore, 13s. 6d. to 13s. 9d.; and regulus, 13s. per unit. The market has remained about stationary for the past month.

## Academy of Sciences.

The regular meeting of the California Academy of Sciences was held on Monday evening last, Prof. Davidson in the chair. The following donations to the cabinet were received: From Prof. Davidson, magnesite from Fort Point, San Francisco; from Dr. H. D. Cogswell, specimens of cement from the walls of the tower of Ramleh, 12 miles from Jaffa, on the road to Jerusalem; also, specimens from the walls of Jerusalem; from the Acropolis, or citadel, of Athens, 150 feet above the plain; also porphyry from the mosque of Omar, at Jerusalem. From C. D. Gibbs, six specimens of pyrites crystals, auriferous, from Calaveras county, Cal. By exchange, six specimens of crystals of calcite, found in Geodes, north of Church Buttes, Wyoming; and lead ore, from Bingham canyon, Utah. From W. J. Downing, bones picked up at Purissima; and specimens of madrono, with a curious growth enclosing a horse shoe hung on it ten years ago, presented as a curiosity. Dr. Kellogg read a paper on the following plants: *Eriogon ericoides*, T. and G., from Mr. John

## Saws—A Fine Exhibit.

Just to the right as you enter the pavilion is one of the most extensive, expensive and instructive displays in the whole building. We refer to the polished article that revolves upon the partition and revolutionized the lumber trade of the world, saws. Tastily arranged and of every kind known to modern use, except the diamond toothed saw used for cutting stone, there is no more valuable or beautiful display in the whole building than that of the Pacific Saw Manufacturing Company, composed of Messrs. Spaulding, Patterson and Sheffield. The manufacture of saws is one of the most ancient of all mechanical industries, they being in use among the old Egyptians and Greeks. By the latter, the inventor was deified with the title of Talus or Perdix. With us, the manufacturer of the best saw is dignified and blessed by all mill-men, and in this list come Messrs. Spaulding & Co. He being the inventor and patentee of the movable teeth, so much in use in circular saws, has greatly improved the superiority of circular saws of the old style used. The value of their exhibit may be calculated by the knowledge that the largest circular is worth near \$500, and the smallest saw in the collection about 50 cents. The longest sash, or "muley" saw in use in the State is by the Noyo mill, in Mendocino, which was made on a special order for the sawing of the large slab exhibited some years ago in the fair. The saw is 16 feet long, and with it was sawn a redwood board 12 feet long and 7 feet wide. The art of forging and tempering mill saws is one that can be acquired only by the best and most intelligent workmen, and the low price of lumber, and the strong competition in the trade, have forced our mill-men to employ the best and most improved machinery in the trade. This has brought Messrs. Spaulding & Co.'s goods extensively into use, as, being right at home, any little defect in a saw can be quickly remedied when brought to their notice, and any peculiarity required in them, or adjustment to any special machinery, can be made to order. They also make saw mandrels and arbors a specialty. They have attached helting to some 14 saws in their exhibit, so as to display them in motion, though not at the speed at which they would be driven when actually at work, and then playfully put up notices to the public not to handle.

Their factory is at Nos. 17 and 19 Fremont street, where they have a very extensive establishment, and many thousands of dollars of stock for inspection and sale.

## Fine Castings.

The Aetna Iron Works, Pendegast & Smith, proprietors, make an exhibit in the line of iron castings, which, though a single piece, is of a shape probably the most difficult our foundries have to deal with. It is a large propeller for the steamer Ajax, and weighs 10,600 pounds. It is fourteen feet in diameter, being the largest in size and weight ever cast on this coast. This is the fifth one of this pattern built for the Ajax. In running up the coast the steamer meets a good many large logs which get away from the numerous mills up there, and she has in each case broken her propeller by coming in contact with these logs.

These iron works make a specialty of propeller casting, having on hand patterns for fourteen different sizes. The large one referred to is set up so as to be revolved slowly, and several other smaller sized propellers are within the railing on the floor.

In the same exhibit are a number of patterns of ornamental iron work for house fronts. The Aetna Iron Works also make a specialty of this class of work, orders for which have greatly increased of late years among us. The designs shown are very handsome and much more ornamental than can be made durable in wood. A great variety of these designs is kept on hand, and, of course, new ones are made to order. Altogether the display is quite creditable, and if the example of the Aetna had been followed by more of our foundrymen the general public would have been more favorably impressed with the extent of our iron manufacturing resources.

The Imperial Government of China has issued an edict against the use of opium, declaring its use was bringing destruction upon the Chinese people. In addition to home production, opium is imported into China to an annual value of over \$40,000,000, principally from British India.

## The Pacific Coast.

[Written for the PRESS.]

The author of "Vestiges of Creation," long before this coast was settled by its present population, advanced the idea that on the portion of our continent lying west of the Rocky mountains, and bordering on the Pacific ocean, would grow a people, who for physical power and mental force would surpass all other portions of the globe. More than a million people are now upon this side, and although we of today cannot arrogate to ourselves this distinguished standard of greatness, and will leave it to those of the coming years, yet there are brains in our midst whose spreading powers have already electrified the world by their bold enterprise and successful achievements. And here I refer to Messrs. Stanford, Crocker, Huntington and Hopkins—men who, in the face of the best advice of friends to the contrary, and unaided by friendly capital in the first instance, threw their all into the venture, started, pushed, and finally completed one of the hold-est feats of the age—the building of the Central Pacific railroad—the spanning of the Sierra Nevadas, overcoming their rugged heights, and bidding defiance to mountains of almost perpetual snow. Some will say Government money built it, in part. Granted; but did it not take brains of no ordinary cast—first to grasp the enterprise, secondly, to form the plan of operation, thirdly, the force, tact and capacity to draw the millions piled on millions, to execute and complete it. I never travel over this line but there goes forth a throb of pleasure and appreciation for the brains that conceived and executed it. Let them rear their palaces of beauty, and amass their millions, unenvied—they are the rewards of industry and intellectual force. Not only this, but the applause of the people should be for such men, who, year after year, open new fields for the laboring element of three States and one Territory, and give employment to more than a thousand white men daily. Would it not be a splendid thing for labor, if we had a few more such spirits on this coast, and should such benefits not be appreciated?

Our mining enterprises, too, though we are so young in years, are equal, in stupendous machinery, purpose, depth, yield of the precious metals, and wealth of our adventurers, with any part of the mining world. Our manufactures we have built up, and worked against the odds of paying the highest rewards for labor of any country on the face of the globe.

To, us travelers accord the tribute of being the most independent, off-hand, decided and free thinking of communities. It is said the ocean, whose sight sets thought free, gives freedom to the people. That we are possessed of great individuality of thought there can be no question. Some who stop not to analyze our better natures declare us an unchristian people. Free thought rides in every brain, call it what you will, but Christianity, comes in charitable outpourings, when suffering humanity sends forth its appeal.

This is the race of to-day; we are the fathers of the coming generation who are to fill up the demands of this seer's prophecy. Building upon the foundation and record of more than quarter of a century, such as this coast can present from the pioneer days to the present, much certainly can be expected from the future. We have plowed the cereal grounds, made smooth the rugged mountain passes, studded the highways with homes, planted the vine and fig tree, and perfumed the atmosphere with the orange blossom and the rose. We have built cities, opened commerce, started schools of learning, of arts and sciences, and now bid fair, soon, by our telescope, to sweep further into the mystic expanse than ever Herschell dreamed of. Thus we of to-day have made easy the life of the coming generation. That they will be thinkers and hold operators there are evidences on every side. The capacity, brightness and individuality of the educated youth of to-day challenges the world for their equal. It is natural it should be so, reared, as they are, upon a new soil, solid and invigorated by the vivacity originating in the life, spirit and dash of the golden days gone by, all going to make up strength, holdness and intellectuality. Our worse element of youth, is physical and mental force needing direction and education in the higher ideas of civilized life.

It is this live, individualized, solid, vigorous, metalized spirit of the land, that is going to make the future blaze with the holdest enterprises and grandest outpourings of brain force, and which will make this coast the central point around which the civilized world will revolve. San Francisco is yet to be the peer of London, and the monied power of the world. Central as we are between the great cities of the orient and the occident, and the depot of the trade and commerce of both, how can it be otherwise? It only wants time and brains to shape our destinies.

Our mountains are filled with treasure, and with more unlocked, than the world scarce dreams of, which even now, is filling our coffers monthly with millions of new coined gold and silver.

The year 1900 will bring forth, in a measure,

the realization of the prophecy, and then the hardy pioneers who laid the foundation of so splendid a future, will be known only as the wild gold hunters of the nineteenth century.

ALMARIN B. PAUL.

San Francisco, August 1877.

## The Granite Creek (Oregon) Mines.

A correspondent of the *Bedrock Democrat*, traveling through the mines of Eastern Oregon, gives an account of them, from which we condense as follows: From one of the oldest inhabitants we learn that gold was first struck on Granite creek about the first of June, 1862, by a prospecting party that came through by the way of Auburn. On the 3d day of July following, a company from Jacksonville, Oregon, accompanied by a pack train, loaded with provisions and liquors, encamped on the present site of Independence. They laid over the next day for the purpose of celebrating our national birthday. Learning of the presence of other miners on the creek, Jack Long purchased a bottle of whisky from the packer, and started out to interview them. When a short distance from camp, his mule mired in Granite creek, whereupon he returned for a pick and shovel, declaring his intention to sink a hole under that mule for luck; the remaining members of the party jokingly encouraged him. Jack was as good as his word; after extricating the mule, he continued sinking to the depth of about four feet, where he washed out 25 cents to the pan. This excited everybody, claims were staked off immediately, and a town laid out, which was very appropriately named Independence, it having been located on Independence Day. Granite creek has been worked for about 15 miles of its length, giving employment at one time to 1,200 miners. These have gradually disappeared, with their bags of gold, in search of greener fields, their places being partially taken by the almond-eyed heathens, until now only six claims in and about the place are owned and worked by white men. One of these, however, on Onion gulch, owned by Messrs. Lynch & Co., is quite important. They cleaned up 437½ ounces, yesterday, after a run of two months and a half with five men. The gold in this claim is of a very fine quality. It sold last season for \$18 per ounce in the bar, losing but 4% in melting. At this rate the company will realize over \$7,000 for their season's work so far. Water will last a month longer. The ground is comparatively inexhaustible. Messrs. Bowen & Lucas own and work extensive claims on Granite, and Mr. M. Stevens on Last Chance. These are said to be good; no results reported as yet. The glory of Granite creek, as a placer mining camp, has probably departed forever, but will undoubtedly in the near future be known to fame as one of the richest quartz mining regions on the Pacific slope.

The correspondent goes on with an account of several quartz mines in the vicinity, all of which are silver bearing. Numerous assays have been made of the ore, from the surface down to the various depths attained, by competent assayers, and the results are such as to justify extravagant statements in reference to their richness. The owners of the ledges are men who live here, and will develop their mines as rapidly as circumstances will admit. Having taken a general survey of this locality, we returned to the Rattler, in order to give it a more thorough inspection. This ledge has been traced along the surface for 2,500 feet. Its direction is a little east of north and west of south, which, by the way, is the direction of all the veins in this section. Several shafts have been sunk, all showing about the same. In the bottom of the main shaft, which is 50 feet deep, the vein is 18 inches wide of solid ore. The assay of this one, in silver, ranges all the way from \$26 up into the thousands. A tunnel, designed to strike the ledge at a depth of 165 feet, is now completed to the distance of 285 feet. It is calculated to reach the ledge within the next 50 feet. The cost of development so far has been \$7,000. The owners, Messrs. Klopp, Nail, Deguire, White, Wegner, Back, Waukup and Trione, have exhibited almost unparalleled perseverance in the prosecution of this enterprise. The tunnel has been blasted all the way through hard granite. If the ledge shows as well where the tunnel strikes it, as it does on the surface, the value of the mine can be hardly estimated.

**FLUE DUST.**—The working of the fine dust at the Lemmon mill is progressing very favorably. The proprietors find no trouble in extracting the silver and lead, but the gold contained in the dust has as yet eluded the process. This trouble is laid to the coarseness of the article, and it is being run through the sample mill at the Consolidated works. It is thought that by grinding it to the required fineness all of the precious metals can be saved. The roaster is working well, and the pans, concentrators and agitators, although of an old-fashioned pattern, are doing much better work than was anticipated. Some trouble has been experienced with the machinery, its long disuse and necessity of adapting it to the work causing some delay. The firm are very much encouraged with their experiments, and have no fears of the ultimate success of the enterprise. The importance of the new process, in the event of its success, can hardly be exaggerated, adding, as it does, 13% to the value of every ton of smelting ore extracted from the mines of the district.—*Eureka Sentinel*.

## Salt for Working Ores.

The *Virginia Enterprise* gives the following account of the Eagle Salt Works, which furnish the supply of salt for the mills:

The amount of common salt used in the mills working ores from the Comstock range is from 300 to 400 tons per month, there being less used in winter than during the summer, as the tailings mills (which use a great deal of salt) are then running much lighter, owing to the difficulty experienced in drying slimes.

The salt used in our mills all comes from

The Eagle Salt Works,

Situated on the line of the Central Pacific railroad, 16 miles east of Wardsworth. It is a very pure article; it is said that it is absolutely nothing but salt—there being no foreign substance or mineral in it.

Much of the salt shipped from the works is taken off the cars at mills along the Carson river, at Silver City and at Gold Hill. It is put up in strong sacks, of a size convenient for handling, and arrives here in excellent condition. The salt sells at a cent and a half per pound, or \$30 per ton by the car load. A car holds about ten tons.

How the Salt is Obtained.

Contrary to the generally-received opinion, the salt is not procured in a marsh by digging it out of or scraping it up from the ground. At the place where the salt is found there is nothing resembling a marsh; instead there is seen a large basin or sink, the surface of which is covered with sand. This basin has no present outlet and presents the general features of an extinct lake—a lake from which all the water has evaporated.

The source of the salt found in the basin has been traced to a ravine, in the head of which a well has been sunk to the depth of 12 feet. Shallow as the well is it affords as much water as can be raised with a six-inch pump. Should an artesian well be sunk at this point the water would no doubt rise to the surface and flow from the well.

The water of the well has but a slightly brackish taste and is as colorless as though it had been distilled. Specimens of the water, in bottles, are to be seen at the store of J. C. Hampton & Co., in this city, Mr. Hampton being the agent for the sale of the salt on the Comstock. He has specimens of the water in all stages of strength or concentration, starting with that just taken from the well and ending with that which has been in the vats 30 days, and which is just on the point of becoming solid crystals of salt; indeed, a specimen but one week in the vats showed at the bottom some crystals of salt.

Reservoirs and Evaporating Vats.

From the well the water is pumped into large reservoirs, where it is allowed to stand for some time, when it is conducted to the evaporating vats. The ground on which the reservoirs and vats are situated is gently descending. Neither reservoirs nor vats are made of lumber, but are built in the earth, and of the earth and sand found on the spot.

The surface of the basin is (as stated above) covered with sand. This sand averages about two feet in depth, and under it lies a stratum of tough clay. The vats are made by scraping away the sand down to the clay, and are 60 feet in width by from 200 to 300 feet in length. There being a slight inclination in the ground the water is gradually passed forward from one vat to another, growing stronger and stronger, until, in the last, it becomes pure salt crystals. There are 10 rows or tiers of these vats, and, in all, they cover an area of about eight acres.

The Process used Partly Leaching and Partly by Evaporation.

By sinking a few feet in the stratum of clay underlying the surface sand (which seems to have blown in off the surrounding deserts) a saline water similar to that obtained from the well is found. This water appears to be drawn up by the sand, when it speedily evaporates, leaving the surface coated to a considerable depth with pure white salt.

Surrounding the vats are reservoirs into which water from the well is conducted. These reservoirs are so loosely constructed that the water oozes out through their banks or walls, and, percolating the intervening sand, finally finds its way into the vats. In passing from the reservoirs to the vats the water leaches out and takes up all the salt formed in the sand and thus gains much in strength. This leaching part of the process is of great advantage in summer, when the evaporation is rapid and salt is quickly formed on the surface of the sand.

The time will doubtless come when the surface sand will be shoveled into wooden vats and leached out as ashes are leached at potash works. Even in the clay, masses or pockets of crystals of pure salt are found.

The company owning the works have store-houses on the railroad. They also grind and put up an excellent article of salt for table and dairy use. Owing to the dryness of the atmosphere the salt put up at the Eagle works is almost entirely free from moisture; whereas that brought from San Francisco is quite damp. Parties have several times undertaken to compete with the Nevada works by bringing salt from California, but on account of the great amount of moisture the article imported contains they have failed to make it a paying business. Doubtless, should the Nevada salt be taken to San Francisco and there stored for a time in the moist atmosphere, it would become, by absorption, quite as damp as that imported from the East.

## Prospecting in the Elk Mountains.

John W. Gilson writes to the *Salt Lake Tribune* an account of a prospecting trip to the Elk mountains, from which we take the following:

Having just returned from Elk mountains, whither I went in company with 26 others, five weeks ago, in search of placer mines, I deem it a duty due your many readers to furnish you with a correct account of our researches in that much-talked-of country.

The Distance

From Salt Lake City to Elk mountains via Salina is about 350 miles, and the route is the same traveled in going to the San Juan mines, until a point is reached 19 miles east of Green river, where we leave the main road, taking a southeast course, reaching the northwest end of Elk Mountain valley, in 25 miles of rough, tedious road. One mile further, and we are standing upon the bank of

Grand River.

Grand indeed is this beautiful stream, with its 600 feet of rapid waters, tearing madly through the craggy cliffs of sandstone from the east, whose summits rise perpendicularly to a height of several hundred feet, and rippling musically through the valley for a distance of two miles, glides swiftly out of sight through a square cut defile in a perpendicular wall, which rises to the height of 1,000 feet, and completely hems in the southwest side of the valley.

The Old Mormon Post.

Crossing the river at this point, we pass over a point of rich meadow land and reach the old Mormon fort, which stands on the northeast side of the valley. A large spring of water breaks out of the hills just back of the fort and flows into the meadow below. The fort is 60 feet square in the clear, built of red sandstone, the walls of which are four feet thick at the base, tapering gradually to the height of 12 feet, the apex of which is two feet thick.

The Gold Prospects

Have caused much talk, and, I am sorry to say, prove unworthy of so much notice. On either side of the creek is a large bar of washed granite, gravel and boulders, lying upon a bedrock of red sandstone. In these bars at the surface from five to fifteen colors to the pan of light flour gold were obtained, which, on sinking, gradually increased, until at the depth of eight or ten feet, wholly disappeared. It was the general impression of the party, although the prospect was not flattering, that these few colors must have come from some place, and we naturally looked to the head of the stream for their source. Acting upon this supposition, a detachment of the party set out for that point, which was reached under difficulty, as the country lying between the valley and the mountains proper is the roughest and most inaccessible of any it has been my fortune to meet with during an experience of 15 years in the mountains. Perpendicular bluffs rising to dizzy heights, rough, rugged and dangerous gorges, whose uncertain depths are awful to gaze into; miles of bedrock washed bare and so smooth that horseback riding is a perilous mode of traveling; then add to this dense thickets of oak brush, rose hushes and several other minor obstacles, and you have a route that the stoutest heart would not crave for, or wish to take a pleasure trip. On our way we prospected all likely and unlikely places, but no where did we find as good a prospect as on the bars in the valley; and where we expected to find the best prospect—that is, at the head of the creek—we found nothing at all, and wherever a color was found, it was of the lightest nature.

Elk Mountains

Are about 35 miles in length from north to south, and are composed of three main peaks with their auxiliaries, the formation of which is a sort of gray granite which only shows itself above the surrounding red sandstone a few feet below timber line. No evidences of old wash, or, in fact, any of the indications common to placer mining countries, were found on the west side of the mountain. The east side is still unexplored, and only in one place was genuine quartz found, which, however, contained nothing of value. The country was not what I called thoroughly prospected by any means, but I believe I speak for the majority of the party when I say I am satisfied that no placer gold exists in paying quantities on the west side of the range.

At the north end of the range we discovered another beautiful valley, much larger than the one already described, and if thoroughly explored, we think would prove equally as well adapted to agriculture. We named this Butte valley, from a round mountain or butte that stands immediately in the center.

**NEW MINES.**—A few weeks ago a half-witted fellow, known as "Bismack," while herding sheep in the Sonoma mountains south of Guthrie's ranch, discovered what he believed to be a coal mine. Shortly afterwards he arrived in town, and informed Jacob Ulrich of his discovery and its locality. Ulrich took a pick and shovel and went with him to the croppings, where he found, instead of a coal mine, a very good prospect for a gold and silver-bearing vein. Since then he has sunk a shaft 23 feet deep on the ledge, and has found it to be a well-defined vein, carrying ore in which there is considerable silver and free gold, and, from what we can learn, the chances are excellent for Bismack's coal mine to prove a valuable silver mine.

—*Silver State*.

## MECHANICAL PROGRESS.

## Heating to Forge.

Of the evil effects of improper and unequal heat in the bar, as it comes upon the anvil, none is more conscious than the man who swings the hammer. Messrs. Miller, Metcalf & Parkin, of Pittsburgh, steel manufacturers, furnish the *American Manufacturer* with a letter on this subject, from which, perhaps, our smiths may get suggestions. They say: As much trouble and loss are caused by improper heating in the forge fire as in the tempering fire, although steel may be heated safely very hot for forging if it be done properly, but any high degree of heat, no matter how uniform it may be, is unsafe for hardening.

The trouble in the forge fire is usually uneven heat, and not too high heat. Suppose the piece to be forged has been put into a very hot fire, and forced as quickly as possible to a high yellow heat, so that it is almost up to the scintillating point. If this be done, in a few minutes the outside will be quite soft and in a nice condition for forging, while the middle parts will not be more than red hot. The highly heated soft outside will have very little tenacity; that is to say, this part will be so far advanced toward fusion that the particles will slide easily over one another, while the less highly tempered inside parts will be hard, possessed of high tenacity, and the particles will not slide so easily over each other. Now let the piece be placed under the hammer and forged, and the result will be that the soft outside will yield so much more readily than the hard inside that the outer particles will be torn asunder, while the inside will remain sound, and the piece will be pitched out and branded "burned."

Suppose the case to be reversed, and the inside be much hotter than the outside; that is, that the inside shall be in a state of semi-fusion, while the outside is hard and firm. Now let the piece be forged and we shall have the outside all sound, and the whole piece will appear perfectly good until it is cropped, and then it is found to be hollow inside, and it is pitched out and branded "burst."

In either case, if the piece had been heated soft all through, or if it had only been heated red hot all through, it would have forged perfectly sound and good. If it be asked, why then is there ever any necessity for smiths to use a low heat in forging, when a uniform high heat will do as well? We answer—In some cases a high heat is more desirable to save heavy labor, but in every case where a fine steel is to be used for cutting purposes, it must be borne in mind that very heavy forging refines the bars as they slowly cool, and if the smith heats such refined bars until they are soft, he raises the grain, makes them coarse, and he cannot get them fine again unless he has a very heavy steam hammer at command and knows how to use it well. In following the above hints there is still a greater danger to be avoided, that is incurred by letting the steel lie in the fire after it is properly heated. When the steel is hot through it should be taken from the fire immediately and forged as quickly as possible. "Soaking" in the fire causes steel to become "dry" and brittle, and does it more injury than any bad practice known to the most experienced.

**CASTING NICKEL AND COBALT IN GERMANY AND IN BIRMINGHAM.**—A scientific correspondent of a Birmingham newspaper says: "Dingler's *Polytechnic Journal* has an article on the manufacture of large castings of nickel and cobalt. The size of castings obtained is spoken of as five to six kilograms (about 10 to 12 pounds), but I much question if the Germans can produce such castings as have been obtained by Messrs. Wiggin & Co., of Birmingham. The apparatus used consisted of a round fire-proof oven, similar in construction to Deville's blast furnace. The crucible was placed on an iron plate in the middle of the furnace. A mixture of coke and charcoal was used as fuel, and air blown in at the rate of seven to nine cubic meters (a cubic meter is somewhat more than a cubic yard) per minute. The best graphite crucibles would not resist the action of the high temperature obtained, so a series of crucibles placed one inside the other was used. During the casting the fluid metal often began to froth up and spurt when it was brought into the molds and cooled, and the resulting casts were not solid, but blistered. To remedy this defect, the molds were surrounded by a stout cotton wick, which had been previously saturated with tar or petroleum. This was ignited as the metal approached the molds and formed a large reducing flame, through which the hot metal was passed. The castings were then allowed to cool slowly."

**JUMPING A BAR.**—A few nights ago a passenger train on the Long Island railroad left Jamaica for Long Island City, and when crossing High bridge, a structure 30 feet high, the locomotive struck an iron bar on the track, which it jumped over and alighted on the rails again, as did the 10 cars following, the eleventh coach pushing the obstacle from the rails. A boy named Thomas Kelly was arrested, and confessed that he and three others had placed the obstruction upon the bridge with the purpose of throwing the train over into the creek, so that they might plunder the dead and wounded.

**PULVERIZING MINERALS.**—A simple apparatus, intended principally for disintegrating superphosphates, clay, earth, coal, or other minerals, has been invented by H. and E. Albert, of Biebrich-am-Rhein, and consists chiefly of a peculiarly constructed open drum and wheel. Upon an axle mounted on suitable bearings is keyed a boss having a disc at one end. To this disc are bolted (say) four arms, near the extremities of which is fixed a concentric ring; parallel to this ring are two other rings of similar diameter, and these rings are connected to the former by a series of cross stays or rods, both at their points of junction with the arms, and also at intermediate points. Thus it will be seen that an open drum or wheel will be formed, having arms at one side only, and mounted upon an axle to which a rapid revolving motion (say, from 300 to 500 revolutions per minute) is imparted by means of a strap or belt passing round a pulley keyed on one end of the axle. The superphosphate or other material to be pulverized is delivered by means of a hopper into the interior of this drum or wheel, and in falling it meets with the cross-stays or rods in their rapid revolution in the reverse direction, and becomes thereby thoroughly pulverized or disintegrated. A movable hood is placed over the upper half of the drum or wheel. In a modification of this invention the hopper is placed so as to deliver the superphosphate or other material on to the outside of the wheel instead of the inside, in which case the drum or wheel may have arms on both sides of the boss.

**STEEL LOCOMOTIVE BOILER.**—A correspondent, traveling on the southwestern division of the Chicago, Rock Island and Pacific line, writes: "The twenty-four locomotives, which have all steel boilers, and which have been in heavy service for six years, are all good; not one of them, to my knowledge, has had a cracked sheet. I have patched some of them in the bottom and corner of the firebox, caused by rust and ashes eating the sheet away, but I believe if I had adopted our present system of holding the grate I would not have had to do this. The system consists of leaving the side of the grate a little loose, so that when the fireman shakes the grate he moves the side bars enough to shake all the ashes from between the side bars and side sheets. If ashes do not collect next the sides of the firebox the sheets will not be rusted away. We also place our grates lower than they are ordinarily placed on other roads, the center of the grate being on a line with the rivets, through the mud ring. We used the 'fingered' rocking grates. I have been using for three months a slide valve with ports  $\frac{1}{4}$  by 10 inches and 13-16ths, outside, and scant 1-16th inside lap. The cylinder is 16 by 22 inches, and I think the engine works better in all respects than it did with the old valve with ports  $\frac{1}{4}$  by 15 inches and the same lap."

**THE VALUE OF SMALL INVENTIONS.**—An excellent exemplification of the large returns which a small invention may often bring to its fortunate originator is found in the experience of Mr. Chas. W. Cahoon, who recently died at Portland, Me. Mr. Cahoon possessed much inventive ability, besides that quality of persistent determination to succeed which usually characterizes the successful inventor. It is said that he realized \$60,000 out of a little lamp burner, which had an appliance for lifting the chimney, so that the wick could be reached for lighting or the mouth of the lamp for filling. This saved the frequent removal of the chimney while hot, and so doubtless prevented many fingers from being burned and many chimneys from being broken. Simple as was this device, Mr. Cahoon studied hard over it, and nearly lost his eyesight by persistent watching of the lamp flame under different conditions. It was the first invention of the kind patented (February, 1861), and infringers were plenty; but Mr. Cahoon protected his rights manfully and triumphed in the end. It is to be regretted that he could not have lived longer to have enjoyed the fruits of his strivings.

**SIGN OF SPEED.**—The Pennsylvania Railroad Company has recently introduced on freight trains a new signal. It consists of a flashing light that indicates the speed and distance of a train, and shows whether it is at rest or in motion. This light is of two colors, one of them red and the other white, placed on the caboose, so that they may be seen in both directions on the line. A simple device for hiding the light at intervals is affixed to each lamp, so that it may be made to alternately appear and disappear, and by suitable gearing this is connected with one of the axles of the car. While the car is at rest the lights are steadily visible; when the train moves the lights flash once for each revolution of the wheels, and thus its movement and actual speed can be easily estimated as far as the lights can be seen.

**STRAIGHTENING A SPIRAL.**—Many watchmakers, says the *Revue Chronometrique*, when they have a spiral to straighten or close up, simply place it flat on a piece of paper or an ivory surface; but the shadow thrown by the spires frequently renders the shape of the spiral indistinct, and does not permit of the distances between the spires being properly judged. A Parisian watchmaker, M. Majoury, overcomes this difficulty in a simple and efficacious manner. He places a watch glass on the bench, the higher the glass the better, and puts the spiral he wishes to repair upon it. The light from beneath causes the troublesome shade to disappear, and every part of the spiral to be clearly seen.

## SCIENTIFIC PROGRESS.

## Discovery of Oxygen in the Sun by Photography.

Professor Henry Draper read a paper before the meeting of the American Philosophical Society, on the 20th of July last, which has been pronounced, by those fit to judge, the most important contribution to solar physics since Kirchhoff's great discovery. Prof. Draper entitled his paper, "Discovery of Oxygen in the Sun by Photography, and a New Theory of the Solar Spectrum." The paper appears in full, with an illustration, in the *American Journal of Science and Arts*, and in the *Journal of the Franklin Institute*. Prof. Henry has demonstrated the existence of oxygen in the sun, by means of certain bright lines in the solar spectrum, which he shows to coincide with the bright lines of the gas as brought out by the electric spark in a so-called Geissler tube. The discovery, too, was made in a new way—not by comparing with the eye the spectra of the sun and of an oxygen tube—but by actually photographing the two spectra side by side. He publishes the photograph (by the Albertype process) just as it was taken, absolutely untouched and unmodified, except by the printing of certain reference letters and figures upon the negative, and any one can see for himself the significant coincidences. The interest of the discovery is two-fold. For one thing, the apparent absence of oxygen and the other non-metallic elements from the atmosphere of the sun has been to all astronomers a puzzle, and to some hardly less than a stumbling-block, greatly in the way of any consistent theory of planetary evolution. The discovery of oxygen, thus inconspicuous, but unmistakable, removes the difficulty, and makes it more than probable that many of the other elements, hitherto unrecognized, may yet be found. The other point of interest in respect to the discovery is the means by which it was accomplished. The difficulties in the way of such a photographic success are enormous, especially as regards the obtaining an oxygen spectrum of sufficient steadiness and brilliance. This was accomplished by new methods. The light itself was, indeed, produced in the ordinary way, by sending an electric spark from a powerful induction coil through a Geissler tube; but the coil itself was worked, not by a current from a galvanic battery, as usual, but by the current from a Gramme dynamo-electric machine, slightly modified for the purpose. And this machine was driven, not by a steam engine, as is commonly the case, but by one of the new petroleum motors, which in steadiness and economy proved itself far better than a steam engine. The apparatus generates a steady stream of sparks, each ten inches long, sixteen every second, and keeps it up for hours, if necessary. Without such appliances the research and discovery would apparently have been impossible.

**INDIA-RUBBER.**—A large number of kinds of trees, remarks the *New York Independent*, give india-rubber, almost every popular rubber district having a tree of its own. The most popular article at present is that from Para, which is from the *Hovea Brasiliensis*. Though the article is in such demand, it has been calculated that, even allowing for increased demand from more numerous populations and increased demand from improved art, there will be no essential diminution in the Para product for the next 100 years. But, besides this, a new rubber tree has been discovered in the Brazilian district of Araçaty. It is, botanically, *Hancornia speciosa*. It comprises the bulk of a single forest district of nearly 1,200 square miles, besides in less abundance elsewhere. It is said to be a very superior article and to bring a higher price than any offered in market. Not long since it was feared that the stock would be exhausted soon; but these facts do not confirm this fear.

**THE DARWINS.**—Mr. Darwin's life is a comfortable one—he has never been obliged to fight poverty and has had plenty of leisure in which to follow his chosen studies. He married his cousin, Miss Emma Wedgwood, and they live in the lovely County of Kent. Mr. Darwin's eldest son, Mr. William Darwin, is a banker at Southampton; the second, George, took high honors at Cambridge, and is now a Fellow of Trinity; the third, Frank, who has inherited his father's ill-health, acts as his secretary; the fourth, Leonard, is an officer in the artillery, and distinguished himself as one of the scientific corps sent to observe the transit of Venus; the fifth, Horace, is an excellent mathematician. One married and one unmarried daughter complete a family whose constant care is to relieve its head of all possible trouble or anxiety.

**THE SOLAR PARALLAX.**—Mr. Pogson, at Madras, will take advantage of the approaching favorable opposition of Mars for a new determination of the parallax. Mr. Gill has left England for the Island of Ascension, to make observations with Lord Lindsay's heliometer.

## Indian Burial Customs.

Mr. H. C. Yarrow, of the Army Medical Museum, Washington, D. C., is preparing a memoir upon the "Burial Customs of the Indians of North America, both ancient and modern, and the disposal of their dead," and seeks information on the following points:

1. Name of the tribe.
  2. Locality.
  3. Manner of burial, ancient and modern.
  4. Funeral ceremonies.
  5. Mourning observances, if any.
- With reference to the first of these inquiries, "name of the tribe," the Indian name is desired as well as the name by which the tribe is known to the whites.
- As to "locality," the response should give the range of the tribe, and be full and geographically accurate.
- As to the "manner of burial," etc., it is important to have every particular bearing on this branch of the subject; and much minuteness is desirable.
- For instance:
- (a) Was the body buried in the ground? If so, in what position, and how was the grave prepared and finished?
  - (b) If cremated, describe the process and what disposal was made of the ashes.
  - (c) Were any utensils, implements, ornaments, etc., or food placed in the grave? In short, every fact is sought that may possibly add to a general knowledge of the subject.
- The memoir will be published by the Government.

**FREE INSTRUCTION IN TECHNOLOGY.**—It is an indication of hopeful progress when we see arrangements made for free imparting of technological truth to those who most desire and need it. We read in an exchange that the trustees of the Lowell Institute have made an arrangement with the Institute of Technology for a free course of instruction in "Practical Design for Manufacturers," open to pupils of both sexes. This class will be in charge of a skillful designer and the instruction will be practical. Designing is to be studied as an art which can be applied to decoration or for patterns for fabrics. Already the design for patterns made by students of the institute have been sent to the factories and made use of for various purposes. The class is under the personal instruction of Mr. Charles Kastner, who was designer at the Pacific Mills for 14 years, and who received his instruction from the best instructors in the art in France. During the next year the managers of this institute will have their looms of all kinds running. Among them will be a pattern loom. The instruction in this department will accordingly be so extended as to make the designer familiar with the weaving of the fabric according to the pattern, including, of course, the intricate and elaborate details of putting the patterns in the form for weaving, which, to the uninitiated observer, looks like a tangled wilderness of twine. It is proposed to unite with the study of chemistry for practical purposes the art of making colors. The instruction will be given by a teacher thoroughly competent and having experience in this important art. The introduction of this useful department will complement the instruction in designing by affording the facilities for making the fabric patterns of the designers in the colors which they desire.

**THE NASHVILLE MEETING.**—The annual meeting of the American Association for the Advancement of Science will be held this year at Nashville, Tenn. It is the twenty-sixth anniversary. Although the society was originally designed for the promotion of pure science, it has broadened its fields by degrees, like its British model, and now treats of almost every non-sectarian and non-political theme. The membership is large and distinguished, and associates are admitted who are interested in the development of industrial resources of every kind. The session commences August 29th, and lasts to September 5th. The principal railroads will sell trip tickets for one fare, and the citizens will entertain all who will accept their hospitality. Excursions have been arranged to Chattanooga, the mineral field of Alabama, and into various portions of Tennessee, as well as to the Mammoth Cave, Arkansas and Texas.

**INGROWING POTATOES.**—Potatoes are often found inside of other potatoes, and it has puzzled physiologists somewhat to account for the occurrence. Rev. M. J. Berkeley has recently examined a case, and finds that it is caused by a bud (eye, as our farmers would call it) pushing inward, instead of outward; or, as he says, it is caused by an "inverted bud." As every one knows, when a potato is formed, it is simply a swelling at the end of a thread sent out from the buds, which start into growth from the eye. In this case Mr. Berkeley found the thread an inch and a quarter long in the potato before the young tuber commenced to form.

**A VALUABLE THERMOMETER.**—Prof. Moritz has published an account of a thermometer he invented about 13 years ago, which he now thinks might be of utility in meteorology. It is a nearly circular band of silver and platinum, fastened at one end, and at the other moving a mirror, the readings being taken from a scale on the mirror, as in a magnetometer.

# MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## California.

### AMADOR.

**THE BONANZA MINE.**—Amador *Dispatch*, Aug. 18: This mine, in Drytown, which has been lying idle for some time past, will be started up again next Monday, under the management of a Mr. Davis, of Ebbelstown. It is thought that the mine can be operated more successfully than it was under the supervision of Mr. Belding.

**MADISON.**—Amador *Register*, Aug. 18: The faction holding the Mahoney works have let a contract to haul rock to the friend mill. They contemplate working some of the very rich ore discovered of late. A quantity of wood is being hauled to the mine, and appearances indicate that work is to be resumed in earnest. The case involving the control of the property is still pending in the court, and it is thought that the consequence will be to leave before the dispute is finally settled.

**STONE CREEK.**—A man named Anderson has been prospecting in Stone creek, about two miles from the Monticlaro mine. He has lately struck a body of quartz two or three feet wide. The rock is said to be of first-class quality.

**FROM YUBA.**—The Rising Sun mine, on the Mokelumne situated below the canal, has been running its new mill for the last week, and are confident that they have a good thing. Steve Kendall has his new mill ready for crushing, but no water. The buyers boys are taking out some good rock near the old Belden mine. Fine is pouncing away in his mines, near the West Point bridge, and the general supposition is that he is making money, as he never says anything. The Yuba tunnel company got their machinery in running order last Thursday, and turned on the water. Most of the business men of the town were on the ground to wish it success, but it was no go. The head of water was too light to run the mill with proper speed. It requires 50 pounds pressure, and the best they could do was to get 40. It runs nicely under that pressure, but not fast enough to do good work. A number of the Trustees were present, but are undecided what to do. It is the general impression, however, that they will have to shut down till the rainy season.

### BUTTE.

**GRANVILLE GRAVEL MINING COMPANY.**—Granville *Mercury*, Aug. 17: This company are engaged in sinking two compartment shafts on the bluff near the depot. The work is progressing rapidly. They are down some 30 feet and are meeting with good success. They have an engine of 20-horse power and a Wilcox pump of improved make, with a capacity of 15,000 gallons per hour. Good pay gravel is already being hoisted, and it is expected that a rich strata of beach gravel to a depth of some 50 feet. John Evans is Superintendent of the company, and operations are being conducted under his direction. He is an old and experienced miner, having an experience of some 20 years in Butte county. He is just the man for the position on account of his fitness and capacity. He assures us that he is determined to reach the bedrock, an undertaking that has never been accomplished in Butte county in her mining history.

**DISCOVERY OF ASBESTOS.**—We have been shown some fine specimens of asbestos recently found near Dogtown. The fibers were long and delicate, and of the usual white and grey color. Parties who own the mine propose to develop it.

The new mining company have abandoned their attempt to get their further claim, and are now working on their claim above the Cape claim, on account of the low stage of water, which will not permit the boat to be floated there.

### CALAVERAS.

**SHERIFF RASSEL.**—Calaveras *Chronicle*, Aug. 18: The principal object of interest on and about the ranch is the Ferguson and Wallace claim. Near the hoisting works they have out 650 tons of rock, worth \$50 per ton. Let us now examine the mine. There are 20 men at work underground, and they take out 150 tons of rock per month. By running levels to the ends of the mine, rock enough can be obtained to keep the new 10-stamp mill employed for three years. Level work of shaft, and east and west drift, claim 1000 feet in length. The mine probably gives employment to 35 men and they all look cheerful, and I know can raise a "jingle." Messrs. Ferguson, Wallace & Earley are building a new 10-stamp mill. Mr. Trump is the millwright, and T. True, C. Chase, C. Wiggins and J. Gallagher, helpers. Mr. Morrill is building a 10-stamp mill for the Littlefield who bought the McFar claim, which joins the Ferguson & Wallace on the east.

### INYO.

**DEFENCE FURNACES.**—Coro *Mining News*, Aug. 18: The Defence company is receiving coal and wood, and on Monday next the furnaces will be started, let us hope for an extended run that will make a big haul. The Superintendent, P. Reddy, Esq., who, for his tenacity and perseverance, is entitled to the warmest considerations of the Darwin public.

We visited the Defence mine yesterday. The drift now being run to strike the second ledge has been run in a distance of 184 feet, the face still being in hard rock, although there is every probability that they will break through into the ledge within a few days. In regard to this drift, for the entire distance, has been extremely hard, but is now becoming softer at the face. The front vein is being worked by contract, and considerable ore being taken out daily.

**MINNETTA BELLE.**—Superintendent W. E. Brown, of the Minnetta Belle, came in last Wednesday, with 3344 pounds of ore for shipment, valued at \$4,500, which went down on the same day. In regard to the mines he reports as follows: The several mines of the company are looking well in all their various workings. The rich ore bodies of the South Minnetta, which are being stopped, are making a splendid showing. The new strike in the Keystone mine is looking very fine, its extent not yet known, but operations have been commenced for the development of this fine ore body to a great depth. The 10-stamp mill, recently purchased by the company from Mr. R. C. Jacobs, is running on rich ores and piling up the silver bricks. Other shipments will follow in rapid succession, there being sufficient amalgam on hand for at least six bars more, besides a large quantity of first-class ore on the mill dumps and at the mines. This company will be compensated through their mill, in regard to the development of this fine ore bodies, but for better facilities of extracting Mr. Rhodda has confined the work to the drifts and cross-ends making from the main tunnel. It is a singular fact that the Cuervo is the only mine in the Darwin district whose ores combine both gold and silver in large, and of course, paying quantities. No ore has been shipped as yet, as the mill is not yet ready, and some of it has gone as high as \$5,000 per ton. It is no uncommon occurrence for our assayers to obtain results high into the thousands from ores in this mine, carrying gold and silver in about equal proportions. There seem to be very little galena or silver-lead ores, such as have here-

tofore been looked for and found; but, on the contrary, gold, native silver, horn silver, chloride and antimonate of lead, the latter very rich in silver. The Cuervo is one of a group of others owned and being operated to some extent. Besides these mines they have a furnace with necessary machinery, a good office and assay building near it, and at the mine they have good assorting sheds, blacksmith shop and all the facilities for economical working.

### NEVADA.

**GOLD HILL.**—Foothill *Times*, Aug. 18: A bonanza, that old mill of the Gold Hill company is proving to the new owners. It will be remembered that we have several times mentioned that a company, consisting of Mr. George Lord, of this place, and Messrs. McClellan, Ivory and others, in San Francisco, had purchased the well-known Gold Hill mine and mill property. This company are already well along with the work of putting on a new and extensive hoisting and pumping works for opening the mine, and last week they began tearing down the old mill, which has been in rather a tumble-down condition, in order to get out the machinery and iron of value. They had been but a short time at work about one of the latteries when it became apparent that amalgam was plentiful in every joint and crack of the wood work and also in the earth below the floors. Over \$2,000 in gold was taken out in a very short time, and it is confidently expected, judging from what has been done, that at least \$10,000 will probably be cleaned up, besides two tons of quicksilver. This will pay the new company back their investment and enable them the mine and \$2,000 worth of machinery and mill, first-class.

### PLACER.

**MINING IRONS.**—Dutch Flat *Forum*, Aug. 16: Mining in this section has almost come to a standstill. The labor is nearly all claimed, and the claim is being carried on. As before stated, the Superintendent of the C. C. Co., kept back in reserve all the water stored in the company's mountain reservoirs for the purpose of extending the opening in this claim. This supply will last about 10 days longer, when the claim will clean up for the season. Unfortunately the opening in this claim happened to be on one of those bad deposits of cemented gravel which are so difficult to remove. The work, however, has been pressed with such vigor that the pit is sufficiently enlarged to admit of advantageous workings at the commencement of next season.

The Southern Cross and Polar Star claims are not washing, but the Superintendent is busily engaged driving powder drifts in every available direction, so as to be in readiness for the early rains.

At Gold Run, the only work being commenced or worthy of note, is a system of powder drifts in the Cedar claims, and the extension of the bed-rock tunnel of the Miners' Ditch Co. This latter work is being done with the aid of two Barleigh drills; the compressors that furnish the air for which, being driven by water instead of steam. We are informed that this work is progressing rapidly. All the old miners are beginning to make preparations for next season.

### TUOLUMNE.

**SHAFT BRANDED.**—Tuolumne *Independent*, Aug. 16: About three o'clock on Tuesday morning, the hoisting shaft and pump works of the Ohio mining company were burned. Two men were in the shaft drilling, and the fire taking from above from some unknown cause, they were warned by the sparks falling in upon them. The great amount of water where they were at work compelled them to wear rubber clothes and hats, and as they ascended to the surface through fire and smoke, these supreme dangers of the mine were, and was finally sold on by Sheriff Torrey for the sum of \$174,500. The Nevada ditch company own a ditch 23 miles long, bringing the waters of the South Yuba river through the counties of Nevada and Yuba into the mines at Sucker Flat. All this property, together with the extensive mining ground of the Golden Gate Consolidated mining company, will be hereafter enough to keep Superintendent Campbell busy.

**MARKS & DARROW.**—We have seen specimens of very fine looking ore, showing free gold disseminated throughout, from the Marks and Darrow mine.

### YUBA.

**SMARTVILLE MINES.**—Cor. Marysville *Appeal*, Aug. 19: It may be interesting to your readers to get a few lines of items from Smartville and vicinity, therefore I take pleasure in noting some matters that have taken place of late in Rose's Bar township. The most important change is in the appointment of Patrick Campbell as general Superintendent of the Smartville mines, and as general superintendent, and also Superintendent of the Nevada Revere, a new company, vice C. L. Kemp, Esq. The property which Mr. Campbell has under his management comprises the most valuable mining and ditch property in Yuba county. The Blue Point and Tunnel company is the claim that the big lawsuit, entitled Lakey vs. Blue Point company, caused such excitement in the District and Supreme courts of the State, and was finally sold on by Sheriff Torrey for the sum of \$174,500. The Nevada ditch company own a ditch 23 miles long, bringing the waters of the South Yuba river through the counties of Nevada and Yuba into the mines at Sucker Flat. All this property, together with the extensive mining ground of the Golden Gate Consolidated mining company, will be hereafter enough to keep Superintendent Campbell busy.

## Nevada.

### WASHOE DISTRICT.

**YELLOW JACKET.**—Gold Hill *News*, Aug. 22: The main drifts, both north and south, at the 2200-ft level, are still in porphyry, with promising quartz seams. In the face of the main drift east more quartz is making its appearance, with porphyry and streaks of clay. The new working shaft to the eastward is making comparatively slow progress downward, by reason of the hardness of the rock.

**JACKIE.**—Daily yield, 350 tons of ore. The ore stops down from the 600 to the 800-ft level are all looking well and yielding the usual amount of milling ore. The up-raise from the 1000-ft level is up 127 feet, and is opening up some very rich ore. The main south drift, on the 1000-ft level, is making the best of progress, the ore in the face showing much improvement.

**CHOLLAR-POTOSI.**—Daily yield, 60 tons of ore, the assay value of which is \$22 per ton. Driving the east drift, on the 1300-ft level, is making steady progress, notwithstanding the intense heat in the face. Sinking the combination shaft is going steadily forward, the rock in the bottom being quite hard. This shaft now only lacks about 20 feet of having reached the level of the Sistro tunnel, and the blasts in face of the tunnel here, which has reached a point 635 feet east of a direct north and south line with the shaft, are heard quite distinctly by the workmen at the bottom of the shaft.

**HALE & NORCROSS.**—Everything in and about the mine is working splendidly, the pumps being in the most perfect order.

Much delay and trouble has been experienced during the past week in the use of the small pumps on the 1300-ft level.

**CON. VIRGINIA.**—Daily yield, 450 to 500 tons of ore. The stopes going southward, on the 1650-ft level, continue in ore of a very rich character. The ore stopes on the 1550 and 1500-ft levels are being worked again, and show no decrease in either the quantity, quality or character of the ore. The heretofore extracted, on the 1400-ft level, the ore stopes are showing finely. The ore stopes on the 1300-ft level are yielding rich ore and promise a long-continued yield of the same character. The ore stopes on the 1200-ft level, going south and west, are opening out splendidly and promise a fine yield for a long time to come. The main drift, on the 1200-ft level, is being carried forward to connect with the shaft at the earliest moment possible. The repairs to the main shaft have been sufficiently completed to admit of the steady use of the two south compartments, and the repairs to the north compartment will be finished by to-morrow. This admits of the resumption of the extracting of ore at every point. On the 1500-ft level the large double winze has reached the 750-ft level, and is now being sunk deeper in order to make room for a sump in case of a heavy body of water being encountered. The north drift from the Gould & Curry, on the 1750-ft level, is steadily advancing along the wall of the ledge, one side of the drift cutting good

ore and the other in clay and porphyry. The heat in the face of the drift is intense. The rate of progress is about two and a half feet per day.

**CALORNIA.**—Daily yield, 650 to 700 tons of ore. The ore stopes on the 1600-ft level continue to yield rich ore. The repairs to the Consolidated shaft are finished, and the extraction of ore has been resumed on both the 1500 and 1550-ft levels, which are looking finely and yielding rich ores. On the 1550-ft level the extraction of ore has been commenced near the south line, the ore, so far as opened upon showing the richest. The branch drift from the C. & C. shaft is being pushed rapidly ahead to reach the ore vein, which it will probably do by the 10th of September. The Consolidated mill was stopped three or four days during the first portion of the week for repairs, but that will make no difference whatever with the bullion result for the month.

**BULLION.**—The repairs to the shaft are still progressing, and temporarily interrupting the steady working of several of the lower levels of the mine. The work has, however, progressed so far as to admit of a resumption of work in the east cross-cut on the 1700-ft level, which will be done to-day.

**UTAH.**—The north drift on the 1150-ft level has struck the quartz vein at a point 80 feet north of where the first east cross-cut terminated. The quartz vein, at that point is just reaching well defined and richest in form, and is in the ledge further to the southward. The ledge in cross-cut No. 1 was 153 feet wide, of solid quartz, and as perfect a vein and ore formation as there is in any mine on the Comstock.

**GOULD & CURRY.**—Sinking the main incline was somewhat impeded by an increased flow of water during the first days of the week. This necessitated the putting in of a donkey pump, since which time the usual fair rate of progress has been made. Sinking the joint winze, on the Savage line, below the 1600-ft level, is being pushed vigorously forward.

**NEW YORK.**—The new pump tank at the 800-ft level operates very advantageously, catching all the water at that point. Very little water comes in below, as the ground is pretty well drained by the deeper mining works in the neighborhood. The bottom of the shaft is 50 feet below the 800-ft level, and a raise is now being made, excavating the third compartment of the shaft up to the 800, from which point it is already completed to the surface.

**BEZLER.**—Daily yield, 50 tons of ore, which is being crushed as fast as extracted, and yields from \$24 to \$28 per ton. Sinking the drain shaft is being pushed forward with the utmost vigor, the bottom in good working ground.

**SOLID SILVER.**—The vein material at the bottom of the winze consists of clay and quartz, about three and one-half feet in width, some streaks of which give high assays.

**BEST & BEZLER.**—Sinking a winze below the 1700-ft level has been commenced at a point 200 feet east of the main north and south lateral drifts, in cross-cut No. 2. This winze will be an incline, and will be sunk to the 1900-ft level, and there connected by means of drifts with the Gould & Curry and Con. Virginia mines.

**SCIRO TUNNEL.**—Total length of tunnel to-day, 17,820 feet. The face of the header is in soft ledge porphyry, with clay seams, requiring constant and careful timbering. Considerable seepage of water is met with. The average rate of advance is about 11 feet per day. The air is of a somewhat high temperature, being 97°, but the ventilation is good.

**LEVATHAN.**—At the 600-ft level the main south drift is being pushed steadily ahead, with the whole face in quartz of an excellent character, with streaks and bunches of good ore.

**OPHR.**—There is no particular change to note of the ore prospecting in the face of the east cross-cut from the bottom of the south winze on the 1300-ft level.

**CALEDONIA.**—The operations on the lower levels of the mine met with delay during the first part of the week, caused by the breaking of the iron clamp which fastens to the bucket of the pump. This has, however, been repaired, and to-day everything is running as usual.

**OVERMAN.**—The east drift, on the 1400-ft level, is being pushed steadily ahead, the face still in porphyry mixed with streaks of quartz and clay. The east cross-cuts, Nos. 1 and 2, on the 1300-ft level, are also making good headway, the face of each being in very favorable ground.

**JULIA.**—The east drift from the main south drift on the 1800-ft level is steadily advancing, the face in much more favorable ground. The south drift on the 1800-ft level is showing some fine streaks of quartz and vein matter.

**LADY BRUCE.**—The hoisting engine is in place, the reels and other machinery are being put into working position as fast as possible, and everything will soon be ready to start up, when active development will be proceeded with.

**SIERA NEVADA.**—The south drifts on the 1700 and 1450-ft levels are each making excellent progress.

**BRISTOL COX.**—Opening a station in the south winze at the 2250-ft level, or 115 feet below the 2135-ft level, is making good progress.

**MEXICAN.**—Driving the north drift on the 1405-ft level and the north drift on the 1000-ft level are making good progress.

**SILVER HILL.**—The water in the shaft appears to be slowly receding instead of rising. It is the supposition that the Sucker shaft is drawing the flow in that direction.

**UNION CON.**—The east drift from the north on the 1300-ft level is making the best of progress.

**ALTA.**—The west drift on the 1050-ft level is showing soft ground and streaks of quartz of a very lively and available character.

### BRISTOL DISTRICT.

**MAYFLOWER MINE.**—Pioche *Record*, Aug. 18: Frank Wheeler returned from Bristol district Wednesday, and reports that on Monday last some rich ore was encountered in the Mayflower mine, assaying from \$135 to \$213; the ore body getting large as the incline is being sunk. Have commenced to take out ore and putting it on the dump. Wheeler took back with him a number of ore-sacks for the purpose of sacking the fine ore in the mine and preventing it from getting mixed with the inferior quality. The vein is about 10 feet in width.

### CORNUCOPIA DISTRICT.

**DULL TIMES.**—Cor. Silver *State*, Aug. 16: Many of our citizens are removing to Tuscarora, thinking that that camp in a short time will rival the Comstock region. This may be true, but your humble correspondent does not believe it. No doubt they have rich mines there, and their shipments of bullion will be large for some time to come, but yet the place is being overdone. When the mills and hoisting works are completed there will be but little work and miners comparatively few, because it takes but a small number to take out all the ore that the mills can reduce daily. In fact, there are not as many miners at work over there to-day as there are here.

**MINING NEWS.**—Here the Leonard is working a large force, and are understanding that on the 15th instant (to-morrow) and that ought to put on many more. Their developments on the 600-ft level bid fair to rival the Grand Prize. The Panther is also looming up, and I think in a short time will astonish some of those who thought heretofore that it was worthless. This company have already purchased first-class machinery for hoisting works, and are now sinking a main working shaft where they will erect their works. The new development of Sullivan & Co. looks better and better every day, and many predict that that claim will be one of the best mines in the northern portion of the State. The Hussey continues about as usual.

### ELY DISTRICT.

**ALPS COMPANY.**—Pioche *Record*, Aug. 18: The development in the winze on 000-ft level of company's Mazepa mine is looking favorable. Drifting in ore, both east and west, commenced in the winze at a depth of 50 feet. A shaft was run from the north portion of the mine, and it was made to-day by N. C. R. R. to the company's mill. Stopping has been commenced on a fine vein of high-grade ore in the west drift of the 400-ft level, in the Company's Washington & Creole mine. Cross-cuts are being run from west drifts, from 10th and 11th levels of Mazepa

mine, and both mines are being vigorously prospected. The mill is running steadily night and day and working satisfactorily.

**THE MINES AT ELY.**—The mine is looking well. There is considerable improvement manifested in the main drift on the 1200-ft level. An increased quantity of ore is coming out of the 1000-ft level. The stopes looking well. The ore stopes on the sixth level are looking much better. Good ore is coming from the first, third and fourth levels; about 20 tons on an average shipped daily to the mill. The mill is still running on tallings, which it will do for the balance of the month.

**A ROCKY TRIP.**—In company with Sheriff McKee, on Wednesday, we made the round trip from Pioche to Bullionville, Panaca, Round, Dry and Rose valleys, and thence back to Pioche. At Bullionville we found the Raymond & Ely's 30-stamp, the American Flag, and the 20-stamp mills busily at work, the latter being engaged in pumping water for the working of the tailings. Work was progressing in concentrating tailings, but the smelting furnace had closed down, and was not to start up until that evening. The shutting down was caused by the inferior grade of ore which they had obtained for iron ore from Bristol, and which had too small a portion of iron in it to work with the concentrations satisfactorily. Four tailing-houses are in operation and the business men of the mine have improved, as they have in the past pay-days having accumulated considerable money around.

**BULLIONVILLE FURNACE.**—The Bullionville furnace started to work again on Wednesday night, having received iron ore enough on which to make a good run.

**WELL START.**—There is a strong probability of the Raymond & Ely's 20-stamp mill at Bullionville starting to work before the month is over.

**PIOCHE BILLIARDS.**—Wells, Fargo & Co. shipped, during the past week, bullion amounting to \$14,276.95.

### EUREKA DISTRICT.

**CONSOLIDATED FURNACES.**—Eureka *Sentinel*, Aug. 18: The furnaces at the Consolidated, new mills are nearly ready for business. No. 4 was finished last Monday and the pipes and tuyeres are in position. No. 2 will be finished on Monday next. In the event of a favorable decision, work will not doubt be crowded and all four of the furnaces put into operation at once. The company is laying in large supplies of wood, coal and timbers, and everybody connected with the mine and works seem to be confident of the judgment being in their favor. This, however, has no particular bearing, as the Richmond people are equally confident, and rumor has it, will start up all of their idle furnaces on the first of September.

**THE CONNOLLY.**—We continue to hear good reports from the Connolly mine. The lowest level is especially promising, and just as soon as certain connections are made it is confidently believed that a large body of ore will be ready for stopping. The mine is in excellent shape in every part.

**HAMBURG MINE.**—Work at the Hamburg mine is progressing very favorably. The contractors, who are sinking the main shaft from the 250-ft level a further distance of 100 feet, are crowding the work with all possible dispatch, and made a progress of 30 feet last week. It is believed that the same dimensions, as from the 250-ft level upward, and will be divided into three compartments. The station at the 250-ft level is completed, and the east and south drifts well under way. The latter has already passed under the Pacific shaft, through the shade, and is in ore. It will connect with the winze from the south shaft, and open out the ore bodies at that point. For the completion of the contract for sinking the main shaft, connection will at once be made with the 400-ft drift from the 400-ft level of the Friday shaft, and a thorough ventilation of the mine thus secured. Everything about the mine is looking very favorable, and but a short time will elapse before smelting is resumed.

**EUREKA CONSOLIDATED.**—The official letter forwarded by the Superintendent of the Eureka Consolidated this week states that, notwithstanding the state of affairs with the mine and furnaces, the bonanza at the fifth and sixth levels shows no sign of giving out, notwithstanding the daily drafts made on it in the way of extracting ore, the furnaces eating up 750 tons a week, all of which is taken from the above levels. The striking of the ore body at that point was a most opportune discovery for the company, coming as it did just at the time when they were about to be taking out the ore from the mine, and by the injunction placed on that part of the mine by order of the court. In the month of July the two furnaces turned out \$159,000, and it is expected, judging by the output so far this month, that the yield will be increased at least \$10,000, which will make a very healthy showing for the Eureka Consolidated treasury. Had it not been for the loss of ore, a little plaster in the shape of an assessment would have been necessary, in view of the pecunes entailed by the lawsuit. Mining experts and lawyers have to be paid, and it takes coin to do it. Still better news for the stockholders is the development of an immense body of ore on the 10th level, which, in the language of the official letter, "looks as if it would prove to be the best body of ore ever found in the mines." The importance of this rich find to the future of Eureka can hardly be exaggerated. It occurs at a depth of 600 feet, and proves that the Ruby fill mines are not only rich in ore but that they will develop further bonanzas as a greater depth is attained.

### MINERAL HILL DISTRICT.

**QUINT.**—Eureka *Sentinel*, Aug. 16: A correspondent from Mineral Hill informs us of the utter stagnation prevailing at that place. Captain Plummer, Superintendent of the English company's mill and mines, is patiently awaiting orders from London before commencing operations. The chloriders are busy getting out ore and working their claims. J. B. Ayres has been appointed Superintendent of the Cold Turkey mine, and his well-known ability will no doubt put the affairs of the company on a satisfactory basis.

### OSCEOLA DISTRICT.

**OSCEOLA DISTRICT.**—Eureka *Sentinel*, Aug. 16: Ed. McSorley is in receipt of a letter from J. M. Coats, a well-known miner, who is trying his luck in Osceola district. He writes that a few points in the future, the writer has arrived in Osceola four days after leaving Eureka, and have been prospecting ever since. I have made two locations in quartz, but have done very little work on them. I have also located 200 acres of placer ground on Weaver creek, on which I am engaged in cutting a drain so that I can get to the bedrock. The ground caves so bad that we will have to put in a covered drain. No one has yet been to the bedrock in the creek, so I cannot tell how it will pan out. I have prospected a gravel ridge running along the south side of the creek (and which our claim covers), and found gold in every pan from the grass roots to the bedrock, which is from five to twelve feet deep. We have found gold in the creek as far down as we could go for water. We are five miles from Osceola. I think this will give you a good idea of the future. The ledges are large, but the ore is of rather a low grade. None of them have been developed to any considerable extent. There is only one shaft in the district that is 100 feet deep. There are some splendid placer claims on the Osceola side of the mountains, several of which pay as high as \$75 a day to the rocker. With a good sluice head of water, they would pay \$100 per day to the rocker. Water haul for the rockers will cost two cents a gallon. The little five-stamp mill is not running at present. Monroe, an old Eureka coal-burner, has the bonanza of the district. It is a quartz claim situated on the divide between Osceola and Weaver creek.

### SILVER PARK DISTRICT.

**CHANGING HANDS.**—Pioche *Record*, Aug. 18: There appears to be some little stir being made in regard to mining property in Silver Park mining district, as several deeds were made out, last Thursday, for mining property in that district.

### WHITE PINE DISTRICT.

**MINING EXCITEMENT.**—White Pine *News*, Aug. 18: We learn that the people of Eberhardt are considerably ex-

## List of Exhibits of the Twelfth Industrial Fair of the Mechanics' Institute.

All entries for competition are marked with an asterisk (\*)—those for exhibition merely with a dagger (†).

- 1.\* S C Higgins: model of locomotive engine
- 2.\* California Pottery Co: display of terra cotta work, balustrade, fountain, vases, chimney tops, statuary and ornaments, vitrified sewer pipe.
- 3.\* J Brownell: specimens of patent chimneys, ventilating tubes, chimney tops and chimney flues.
- 4.\* California Bellows Manufacturing Co: 8 blacksmiths hells.
- 5.† Prescott, Scott & Co: 1 baby hoist geared, 4 to 1, 6x12, 1 Woodward donkey pump No 1, 1 upright engine with boiler 4x6, 1 baby engine 4x10, 1 upright engine 6x8, 1 upright engine 4x6, 1 upright engine 8x10, 1 air compressor No 1, 8x16, 1 air compressor No 3, 16x30, 1 10-inch plunger pump 8-foot shaft, 1 engine 12x30 with Myers cut off.
- 6.\* Snook Bros: specimens of artificial stone, garden and cemetery ornaments, pavement.
- 7.\* W T Garratt: assortment of steam double acting and ship's pumps, boiler and pump combined, hells, boiler and engine, water gates, gas gates, sample of tubing, brass goods, 1 old hell, A. D. 1620.
- 8.\* Hollis, King & Sons: 3 patent portable engines.
- 9.\* Wallace & Co: specimen coffee mill and sausage chopper worked by water power, 1 water engine.
10. Samuel Kellett: specimens of plaster decorations.
- 11.\* Thompson & Upson: specimens of asbestos paints, roofing, cement, steam packing, gas retort cement, hoiler and pipe covering cement, hoiler and pipe covering double air chamber, hoiler and pipe coverings single air chamber, thread, paper, cloth.
- 12.\* Joshua Hendy: 2 Hendy patent concentrators, 2 \$1,000 Challenge Ore Feeders.
- 13.\* Colgate & Co: assortment of laundry soap, toilet soap, perumery and toilet goods.
- 14.† Davis Bros: specimens of hand-carved wooden brackets, machine-carved rustic picture frames, Florida water and fancy goods.
- 15.\* The Gutta Percha and Rubber Manufacturing Co: rubber goods and patent carbolized hose.
- 17.\* Gutta Percha Manufacturing Co: specimens of rubber goods, patent carbolized hose.
- 18.\* Standard Lubricating Co: standard axle grease and standard cream lubricator.
- 19.\* H Williams & Co: Yerba Buena hitters.
- 20.\* Alta Soap Co: display of staple and toilet soaps, and washing powder.
- 21.\* S S Watson: one Watson's improved novelty dishwasher.
- 22.\* McKeone, Van Hagen & Co: specimens of laundry and toilet soap, and Lesh's magic cleaning fluid.
- 23.\* J Grunzel: specimens of ivory and amber work.
- 24.\* Rock Soap Co: staple and toilet soaps, tooth powder and washing powder.
- 25.\* The Selby Smelting and Lead Co: specimens of shot, lead pipe, block tin pipe and sheet lead.
- 26.\* T S Eastman: one hearse, one platform spring extension-top carriage, one three-spring extension-top carriage, one "C" spring-top phaeton, one three spring-top phaeton, one English spring-top buggy, one side bar top buggy, two end-spring open buggies.
- 27.\* San Francisco Cordage Co: specimens of Manila rope, tarred rope, mining rope, oil well rope, lanyard rope, hale rope, sash cord rope, sisal rope, sized and bale rope, plain and tarred yarn.
- 28.\* A L Bancroft & Co: hooks, as specimens of hinding; books as specimens of publication; account books as specimens of manufacture.
- 29.\* The Lattins Spring Bed Manufacturing Co: slat spring beds.
- 30.\* The California Vitrified Sewer Pipe Works: iron stone sewer pipe, fire bricks, chimney flue pipe.
- 31.\* Hucks, Lambert & Co: specimens of H & L axle grease.
- 32 & 33. Huntington, Hopkins & Co: specimens of hardware, two Rider's compression air engines.
- 34.\* Whittier, Fuller & Co: specimens of plate glass, California white lead, French zinc ground in oil, colors ground in oil, brushes, oil and varnish, painters' and artists' material.
- 35.\* Waterhouse & Lester: assortment of carriage goods and hardware, wagon wheels, buggy wheels, carriage springs and axles.
- 36.\* Mrs Jane Sullivan: one case of embroideries, one case stamps and stamped goods.
- 37.† The Pioneer and Eagle Paper Mills: specimens of printing paper, Manila, straw, and blank heavy.
- 38.\* California Bleaching Soap Co: specimens of bleaching soap.
- 39.\* The California Electrical works: electrical apparatus and telegraphic instruments.
- 40.† Boericke & Tiel: Homoeopathic pharmacy, books and goods.
- 41.\* Ernest L Ransome: artificial stone monuments, vases, fountains, statuary, carriage steps, garden rolls, Portland cement ornaments.
- 42.\* One straw burning engine.
- 43.\* Mrs Letheby: globes containing wax flower work.
- 44.\* J W Bones: architectural designs.
- 45.\* W S Townsend: specimens of fancy candies.
- 46.\* Meeker, James & Co: specimens of carriage hardware, spokes, hubs, rims, shafts, single-trees, neck yokes, and buggy wheels.

- 47 & 48.\* R W Brebm: one wood turner's lathe, specimens of wood turning work, California wood.
- 49.\* C L Kendall: Aldine non-explosive burning oil.
- 50.\* John Taylor & Co: specimens of druggist's chemist's and liquor dealer's glassware, and assayer's goods.
- 51.\* Miss S E Morgan: portraits in crayon.
- 52.\* John J Agnelli: lava specimens from the Sandwich Islands.
- 53.\* Will & Finck: California carving sets and general cutlery.
- 54 & 55.\* Wm T Coleman & Co: specimens of chocolate, borax, cement, lye, salmon and oysters, soap, candles and fire extinguisher, fire-proof construction, architect's lathe, and shutters.
- 56.\* Bowen Bros: Bowen's yeast powder.
- 57.\* L Hess: Damiana hitters.
- 58.\* B H Freeman & Co: fancy stair posts, rails and ballisters.
- 59.† Newton & Jenks: Reec's compound fire extinguisher.
- 60.\* John W Quick: screens for quartz, cement, flour and rice mills.
- 61.† T S Clark & Co: spring mattresses, iron bedsteads and bed lounge, woven wire bed spring frame, Union wire mattress.
- 62.† James E Gordon: handles, files, locks, lawn mowers and oil tanks.
- 63.\* Nelson & Dohle: mining and blacksmithing tools.
- 64.\* Alex Mackay: rag carpet, cocoa matting, mats and chair mats.
- 65.\* W F Palmer: edge tools.
- 66.\* Robert Conlter: Wakefield rattan furniture, baskets and fancy articles.
- 67.\* Figer Bros: brushes.
- 68.\* W E Worth: Eureka cement.
- 69.\* G & W Snook: tank water filter.
- 70.\* Pacific Saw Manufacturing Co: specimens of circular, mill, gang, cross-cut, muley, hand, hatcher and scroll saws—planing knives, currier's knives, cabinet scrapers, plasterer's mitering rods, mowing and reaping sections, and saw mandrels.
- 71.† G W Spaulding: patent inserted tooth, circular saws and saw teeth.
- 72.\* Yates & Co: lamps, coal oil stoves, axle grease, vacuum oil hlaeking and machine oil.
- 73.\* Thomas O'Neill: specimens of ornamental, stained, ground, cut, bent and embossed glass.
- 74.\* Harris & Bradley: portable fruit dryer, steam wash hoiler, water heater for dairy use, steam feeder for stock, dried fruits and vegetables.
- 75.† W E Worth: model of elevator, and oil cloth printing machine.
- 76.† Koehler & Ritter: silverware of California manufacture.
- 77.\* San Francisco and Pacific Glass Works: specimens of druggist glassware, pickle, sauce, mustard, beer, soda water, schnapps, gin, hock, wine and claret bottles, brandy flasks, fruit jars, Mason's patent, Mason's improved and Grover Ring, demijohns, elastic demijohn, (C Newman's boxed demijohns and cup flasks.
- 78.\* L H Woodin: Althouse vaneless wind mill.
- 79.\* L Schuman: meerschaum and amber work.
- 80.\* T C Walters: axles and shaft coupling, water filter and cooler.
- 81.\* James E Gordon: weather vanes, lawn mowers, oil tank and handles.
- 82.\* Mrs H A Moore: hair producer.
- 83.\* M C Hawley & Co: regulator windmills, Rice straw burning engines; gold medal separators, Moline gang plow (John Deere), sulky plow (Gilpin), Taylor rakes, perpetual hay press Buckeye new model mower, do S R reaper.
- 84.† M C Hawley: Moline single plow (John Deere), Philadelphia lawn mower, Adams patent self-feeding power corn sheller, running wind-mill pumps.
- 85.\* F Ogden: ore feeder (Tulloch's).
- 86.\* Ward A Hephurn: specimens of avena or oatens grits (Lunt Bros), oysters (A Fields), yeast powder (Dooley's), Pride of Kitchen soap (W L Troxell), condensed milk, Alderney brand.
- 87.\* Joe Poheim: dress cloth suits for gents', business do.
- 88.\* C Pizzala: Italian and French sansages, California make.
- 89.† Berry & Place: scroll saw.
- 90.\* George Nelson: model of ship Independence, hull-rigged.
- 91.\* P J Haven: scroll work done in pavilion.
- 92.† Yates & Co: Reec's patent compound fire extinguisher.
- 93.\* H N Cook: leather belting, hose, hose pipes, canvas bags, mail bags, lace leather, cut lace leather, hydraulic packing, fire buckets.
- 94.\* California Silk Manufacturing Co: specimen of sewing and embroidery, silk, California make.
- 95.† F Flanagan: Centennial cement for mending glass and earthenware.
- 96.† Mrs D A Smith: Bon Ton for the complexion, Sea Foam for the teeth.
- 97.\* J Hendy: lathe driver, Harris' patent, hydraulic elevator, Cranston's, Cocbran's cam, Stanford's patent ore feeder.
- 98.\* Samuel Hill: Florence oil stoves.
- 99.\* A Nachman: wire spring beds, (Champion) Judson's patent.
- 100.\* C H Jenkins: chess table inlaid with different colored woods.
- 101.\* Alta Soap Co: horax soap.
- 102.\* Winants & Co: Self adjusting shoe button fastener.
- 103.\* Heywood Bros & Co: suite rattan furniture, 16 pieces, rattan chairs, cane and wood chairs, upholstered office chairs, cane seat and back sofa.
- 104.† National Drill and Compressor Co: 12-inch steam air compressor, rock drill, hoisting en-

- gine, upright engine and boiler, oil well boring engine with tools.
- 105.\* A J Baling: feathers for hats.
- 106.\* E Higham: Featherless drafting rule for dress cutting, paper patterns.
- 107.\* William R West: Teed's five and six string banjos.
- 108.\* Samuel Bernstein: silver show cases.
- 109.\* S F Morse: "Centennial" cement for mending glass, earthenware, etc.
- 110.\* J O Johnson: feed box.
- 111.\* M Miller: silver show case.
- 112.\* John West: folding tables for sewing and cutting.
- 113.\* Etna Iron Works: steamship propeller, specimens of ornamental and plain castings.
- 114.† T S Clark & Co: hotel cot, jail bedstead, military iron bedstead.
- 115.† Nolan Bros: boots and shoes.
- 116.\* Stanley Rule and Level Co: carpenter's tools.
- 117.† Blackmar & Davis: pianos.
- 118.\* J Landsberger & Co: I X L bitters, and "Dew of the Alps."
- 119.† J Renz: white wine, Reeshing.
- 120.\* Kinsey Lanuis: mineralogical display, galena, silver and gold ores.
- 121.\* John H Mackie: hydraulic sewer traps, Mackie's sewer pipe connection.
- 122.\* Knudsen & Ireland: Adams & Stickney's halloon gas regulator.
- 123.† Hemme & Long: upright pianos.
- 124.\* B Nathan & Co: display of ornamental bronzes, of East India jase-po-ri ware.
- 125.† C F Richards & Co: Trapper's Indian Oil.
- 126.\* Jacob Strahle & Co: inlaid hevel billiard table, black walnut "Nonpareil" gold inlaid billiard table, "Centennial" billiard table, "Champion" billiard table, black walnut Grecian carved billiard table—all with Delaney's patent steel wire cushions.
- 127.\* B Nathan & Co: display of house furnishing goods, refrigerators, ice cream freezers, tea, coffee and chocolate boilers, pans, iron ware, patent student lamps, spice and salt jars, cat teasers, bread cutter, fenders and coal hods.
- 128.† San Francisco Yacht Club: pictures and models of yachts.
- 129.\* B Nathan & Co: display of fancy goods, folding magic mirrors, terra cotta statuary, bisque fruit plate, coupe and saucers.
- 130.\* Wm E Shepman: old work replated.
- 131.\* Gilbert & Moore: school furniture.
- 132.\* R W Jackson: ahalone shell jewelry.
- 133.† A Rushmore: Daniel Judd's patent excavator.
- 134.\* W F Herrick: models of schooner yachts.
- 135.\* Meeker, James & Co: hub hoxing machine, spoke teauting machine.
- 136.\* C J Simmons: Edison's electric pen.
- 137.\* C H & G W Burr: slop hoppers, weather strips.
- 138.\* W O Laughna & Co: asphaltum sidewalks, pavements and roofers.
- 139.\* I & E Emanuel: cabinet furniture.
- 140.\* L W Taper & Co: specimens of photographic India ink, black crayon, life size colored pictures, life size water color pictures.
- 141.† California Furniture Manufacturing Co: display of furniture and upholstery; one enameled bedroom set of six pieces, one walnut bedroom set of three pieces, two spiral spring beds, one woven wire mattress, one easy chair, one parlor set in satin, curtains and cornices, one lamhrequin and drapery in satin and one in plush, one ehyon and ivory cabinet, one center table, one French lounge in plush, one dining room set.
- 142.\* Strahle & Co: display of ivory and composition billiard goods.
- 143.\* J Unna: specimens of brushes, brooms, whisks, feather dusters.
- 144.\* B N Rowley: specimens of coal.
- 145.\* S. F. Journal of Commerce: California flour, display of iron, pateat paper boxes, photo-electrotyping.
- 146.\* W B Ewer: patent photo hackground.
- 147.\* W H Martin: roofing slate.
- 148.\* Goodwin & Co: display of furniture, black walnut bedroom suits, parlor suits, satin Turkish chair, hall chair, book case, library desk, center table.
- 149.\* Bette Spring Co: coach, wagon, platform, side hent, sulky, buggy, compensating side rockaway, express, seat, milk wagon springs.
- 150.† Chartrey & Low: specimens of ornamental and plain castings, and patterns for castings.
- 151.\* Mrs G F Atkinson: one hand quilt.
- 152.\* M C Hawley: rubber helt, rubber hose.
- 153.† H Palmer: specimens of port, sherry, red and white wines, etc.
- 154.† Mills & Leak: glovee and ganntlets.
- 155.† Sumner, Whitney & Co: law hooks and revolving hook cases.
- 156.† Aitken & Lnce: specimen of golden vein marble.
- 157.† Wm M Hendry: iron casting, first one made in California.
- 158.† Land Department Oregon and California Railroad Co: 24 specimens of grain.
- 159.† San Francisco Forge Co: crank axles and stalk holders.
- 160.† Jaccard: case of candies.
- 161.† Jacob Zech: upright piano, grand do, square do, skelton do.
- 162.† Kohler & Chase: grand piano, upright do, square do, organ.
- 163.† American B H O and Sewing Machine Co: sewing machines, the only self threading shuttle machine, self setting needle.
- 164.\* Hall & Kelsaw: steam launch, iron propeller.
- 165.† G H Stipp: specimens of penmanship, etc.
- 166.\* A D Pryal: ornamental tree, called Pryal's golden Italian cypress. † bee hive
- 167.† Mrs A Townsend: 1 globe wax flowers, 1 air castle.

- 168.\* Emerson, Colville & Co: pressed salmon.
- 169.\* M Grey: grand, square and upright pianos.
- 170.† Middlemas & Boole: ship's knees.
- 171.\* Lang & Co: California hock and brandy.
- 172.† Geo A Davis: farm wagon, spring wagon, delivery wagon.
- 173.\* J H Hall & Co: Walton hand washing machine.
- 174.† Mrs Crawford: leather frames, oriental work, rice paper flowers.
- 175.† Mrs Letheby: tapestry 300 years old.
- 176.\* Mrs Letheby: bead work, melon seed bracelets, lace cap, collar do, wax fruit, wax flowers, wax picture.
- 177.\* Mrs Blacket: rice paper flowers.
- 178.\* Miss Maloney: rice paper flowers.
- 179.† Miss M C Bucklin: specimen of tatting and crochet.
- 180.\* J H Small: 1 planing and matching machine.
- 181.\* August Monnier: marble inkstand the whole carved from one block.
- 182.† W F Toothaker: patented eccentric chuck.
- 183.† Carmen Island Salt Works: Carmen Island salt.
- 186.\* Sahier and Co: 2 sacks imperial mill flour.
- 187.\* Warren Cranston: display of cheese.
- 188.\* E J Gould & Co: specimens of Pollsher wool.
- 190.\* Oregon Iron Co: 4 bars of pig iron, 1 bar of pressed iron, 1 casting of iron.
- 191.\* R D Hume: 4 cans of Rogue and Columbia river salmon.
- 192.\* Alden Fruit Preserver: 11 sample cases of dried fruit.
- 193.\* J T Borchers: 2 boxes Columbia spiced sardines, 3 boxes Columbia caviar.
- 194.\* Alley & Co: 1 hottle salmon oil.
- 195.\* Luninucher & Co: 6 calf skins of leather.
- 196.† James Collins: one box of peaches from Grand Island, Sacramento river.
- 198.† J L Pressler: one improved patent grate front.
- 401.† Wm T Coleman & Co: Magnolia Hams.
- 402.\* A W Baker: Boston dress reform undergarment.
- 403.\* J Herzog & Co: Eureka hair.
- 404.\* W H Burton: lawn awning.
- 405.\* W H Campbell: Handasyde's hoiler composition.
- 406.\* J Warren Ball, Esq: specimen of writing.
- 407.† S C Bugbee & Son: architectural drawings and photographs.
- 408.\* W H Burton: drum of hoilers, felted and main steam pipe.
- 409.\* Pitcher & Palmer, Prehel & Co: axle grease.
411. The Chronicle: stereotype plates and monlds.
- 412.\* Raymond Wilscher (Buffalo S Co): scales.
- 413.\* Newsom Bros: architectural drawings.
- 414.\* J Vogeley & Bro: candies, plain, fine and fancy.
- 415.† Journal of Commerce: alfalfa and other hay.
- 416.\* Taylor Goodrick: Magee ranges.
- 417.\* Hucks, Lambert & Green: axle grease.
- 418.\* R E Woods: gopher trap.
- 419.\* Whitfield & Gueren: module, or water meter.
- 420.\* L Savage: drawing school.
- 421.\* S H Nicholson: "Centennial." flavoring extracts.
- 422.\* Williams & Howse: oil stove and fixtures, "Pacific."
- 423.\* Yost & Vanlaere: marble mosaic mantels.
- 424.\* B Graves & Co: carriages, landau extension top rockaway, top buggy, heavy, open piano wagon, Oppenheim jump-seat, no top, do with top, complete unfinished Oppenheim jump-seat, wide track open wagon for country.
- 425.\* Atlantic Bottling Co: lager beer and patent bottles.
- 426.\* Sutton, Stoddard & Voshurg: india ink and water color portraits.
- 427.\* J R Harrington: tylene iron.
- 428.\* T L Merrill: Asbestos, utilized asbestos, steatite, crude and pulverized, asbestos steam packing, asbestos boards, pulverized talc, asbestos brick for lightness, four sample hoilers of wiring and felt covering, wiring of pipe and felting with asbestos hair, steatite roofing, asbestos lining.
- 429.\* A Van Alstine: gums, bitters, phosphorine and cream phenol.
- 430.\* Hamilton & Learned: baby jumper and fancy hoxes.
- 431.\* E A Stockton: step-ladders, patent.
- 432.\* Mrs Wm McBrien: bed spread crochet.
- 433.\* E B Older: oil stoves, "Adams & Westlake"
- 434.\* Sweetser & DeLong: cider vinegar, champagne cider, hard, sweet, boiled and new cider.
- 435.\* Wm Cameron: embroidery goods and patterns.
- 436.\* McMillen & Kester: syrups, hitters, cordials and essences.
- 437.\* Phelps & Miller (Middleton plate Co): plated ware.
- 438.\* Doyle Bros: lot of Japanese goods: Curios as Sasuma, Koto, Ovari, Kaga and Emarle ware, bronze antiquities, implements of war.
- 439.\* Shephard & Co: hair dressers' goods, etc.
- 440.\* J E B Myers: pictures, "Cascades of the Columbia," "Baptism of Covenanters," "Wild Flowers of California."

- 442.\* John Mallon: glass, etained, ground, "hent glass special," common hent and embossed.
- 443.\* California Wire Works Co: wire goods, fence, summer house, arches, flower pots, cloth diamond work, riddles, sieves, hird cages, door and window screens.
- 444.\* Salamander Felting Co: hoiler and pipe covering.

## Mining for Gold in Black Sand.

A correspondent of the *Willamette Farmer*, writing from Coquille City, Coos Co., gives a long account of the Black sand mines, from which we extract the following:

The mining region is an old beach, two and one-half miles from the present one. Two companies are working here, about one-fourth of a mile apart. The Black sand is laid in a strata from two to six feet thick and 50 to 100 feet beneath the surface. The "cet," at the mouth of the tunnels, having been sliced out to a depth of 50 feet, the formation is clearly shown, consisting entirely of sand; grey, white, and yellow; old sand dunes, covered with a few inches of soil, and a growth of giant firs and cedars, which might have served in the days of King Solomon, for beams and rafters, for the house of his favorite concubine.

Large trees, lying prone, evidently drift logs, are encountered in the tunnels. At the time of my visit the workmen were cutting through one of unknown wood, 90 feet below the surface. Another, cut through in the same tunnel, a redwood (Sequoia) over four feet in diameter, showed unmistakable evidence of having been subjected to pounding in the surf. These logs are 72 feet above the present sea level, in a hilly, almost mountainous country, made up almost entirely of pure sand carrying a heavy growth of old trees; they tell the story of the lapse of time in this locality, where rolled the boundless Pacific; "hearing no sound save its own dashing;" and the same formation also shows by what imperceptible degrees the waters followed the Star of Empire, and the strip of two and one-half miles of *terra desolata* has been added to the west shore of the American continent. And still the process is going on, and our Uncle Samuel is not only gaining ground, but the tireless ocean is expending its energies for the benefit of man, and continually casting up its golden sands within reach of the lucky miner. The richest sand is said to be on the present beach, where it is covered with water at every tide. Various theories are advanced to explain this gradual receding of the ocean; but perhaps as ingenious and satisfactory as any is that of the sailor, who accounts for it in this wise: That as the earth whirls rapidly to the east, the water being a heavy liquid and easily movable, is unable to keep pace with the motion, and therefore naturally slashes round to the other side. "Quien Sabo."

The black sand is believed to have come from the coast mountains, being brought down by the streams to the sea, and then beat up ashore. This being true, it follows logically that black sand containing gold should be found more or less all along the coast. The sand resembles very fine-grained gunpowder, but is not entirely black. Under a magnifier it shows beautiful, clear, polished black grains interspersed with differently tinted agates, from clear white, and transparent, to a ruby red. The gold is very fine, almost microscopic in its character, and is therefore very difficult to save by ordinary methods. Indeed it is claimed that the sand in the "tailrace" contains twice the quantity of gold that is taken out by the process through which it passes.

At the C. B. M. Co's mine the sand is simply washed in a sluice, and passed over a copper plate covered with mercury; but parties lately from San Francisco are putting up at their mine machines known as the Frue concentrator. This machine consists of an endless rubber belt, having a flange standing up on each edge. About seven feet of this belt lies level laterally, but is inclined lengthwise, so that water will run with a brisk current. The belt is given two motions, by suitable machinery; a shaking motion from side to side, and a slow traveling motion against the current of water flowing over it. On this belt the sand is floated in water and agitated, and the gold shook down to the belt, where it is expected to adhere; the sand passing on down with the water into the tailrace; the gold passing with the belt over the pulley, is jarred and washed off on the under side.

This machine will, it is claimed, save 80 per cent. of the gold. If so, there is a "big bonanza" here, and black sand mining will take a front seat among the industries of Oregon.

**COAL.**—Johnny Bell, engineer on the Eureka and Palisade railroad, took on board a cargo of Palisade coal, Sunday afternoon, and tested its quality on the trip. He reports it as an excellent article of fuel, burning freely and making steam very fast. The mine has improved all the way from the surface to a depth of 50 feet, and great hopes are entertained of eventually striking a stratum of coal that will prove of sufficient extent to warrant the erection of hoisting works. Messrs. Ferguson & Young are running a cross-drift from the bottom of the shaft, but will soon commence to sink again.—*Eureka Sentinel*.

**MINING DECISION.**—The Interior Department has decided that the adverse claims to be considered must be sworn to by the party claiming adversely and not by the attorney. Hearings may be had to determine whether the legal expenditure has been made on the mine for which a patent is desired. The expenditure of more than \$15,000 by owners of the adjoining mine on a portion of a tunnel running through the premises embraced in the application for patents, in case the applicants were to have an interest of such tunnel, is considered an expenditure under the mining laws upon the claim applied for.

## USEFUL INFORMATION.

## Science and the Sea Serpent.

Professor Proctor, the well-known English astronomer, has an inclination toward a belief in the sea serpent which has taxed people's credulity for so long a time. In the *St. Nicholas* he writes:

I think it may interest your readers to jot down a few facts—some of which are not commonly known, I believe, while others are commonly overlooked or forgotten.

1. A great number of foolish stories have been told about the sea serpent by anonymous hoaxers; so that,

2. Persons of known name are apt to be ashamed, rather than otherwise, to describe any sea creature (or appearance) which they suppose to be the sea serpent. Yet,

3. In 1817, eleven Massachusetts witnesses of good repute gave evidence on oath before magistrates (one of whom corroborated the evidence from his own observation) about a serpentine sea creature 70 or 80 feet long, seen in some cases within a few yards. It presented all the features afterward described by the officers of the *Dredalus*.

4. In 1833, five British officers record a similar experience.

5. In 1848, the captain of a British frigate sent to the Admiralty an official description of such a creature, seen (by himself and his officers) traveling past his ship, close by, so that he "could have recognized the features" of a human person at the distance "with the naked eye."

6. Captain Harrington and his officers saw such a creature in 1858, under such circumstances that he says: "I could no more be deceived than (as a seaman) I could mistake a porpoise for a whale."

7. The story last related, marvelous though it is (rejected on that account, when first received as a probable hoax), has been deposed to on oath by all who were on board the *Pauline* at the time. The captain of the *Pauline* writes me that, instead of being anxious to tell the story, he and his officers and crew were in twenty minds to keep it to themselves, knowing that they would be exposed to ridicule and worse.

8. It is certain that creatures of the kind—i. e., not sea serpents, which few believe in, but sea saurians—were formerly numerous.

9. Of other creatures numerous at the same time occasional living specimens are still found.

10. Agassiz states that it would be in precise conformity with analogy that such an animal as the *Enaliosaur* should exist still in the American seas.

11. Of several existent sea creatures only very few specimens have ever been seen (in some cases only one). With these and like facts before us, we may believe that the above-mentioned observers were deceived and doubt whether any *Enaliosaurs* continue to exist. But there is no scientific reason for denying the possibility of their existing and being occasionally seen. The foolish stories told by hoaxers have no bearing on the case one way or another. At least, they should have no bearing with those who can reason aright.

**PAINTED ROOFS.**—S. W. Jewett, of Shepherd Home, Vt., writes to the *Argus and Patriot*: Cast your eye over any village, or country town, and you find looming up thousands of naked roofs of shingle, unprotected by a coating from the painter's brush. You can travel through the States and not find, perhaps, on your road, even one building where the shingles have been decorated and preserved by oils and paints. If outside walls are preserved and benefited, why not see to the roofs as well, and apply a suitable coat of paint to preserve, adorn and decorate the whole? I was born and have lived under roofs thoroughly painted nearly all my life, and my experience tells me that for a better system of management the roof should be the first to save and protect. If paints are immediately applied, it guards against shrinkage, warping, splitting, leakage and the gathering of fine woody down, and moss from growing to the shingles, where sparks might lodge and ignite the whole into one vast flame. Even the wearing and preserving of the roof for many years, if for no other reason, should be a sufficient inducement to add to the expense a full finish from the painter's pot.

**HORSEFLESH FOR HUMAN FOOD.**—In 1875, the horse butcheries of Paris furnished, for public consumption, 6,865 horses, asses and mules; in 1876 they furnished 9,271, giving 1,685,470 kilograms of meat meat. At Lyons, the number has diminished from 1,262 in 1875 to 1,088 in 1876. On the 1st of January there were 58 butcheries in Paris and only seven in Lyons. At its meeting, on January 9th, the committee *de la viande de cheval* awarded a silver medal to M. Petard, who has nine butcheries in Paris, as a reward for his enterprise.

**AN ENORMOUS PIECE OF COAL.**—Last week an enormous piece of coal, which we understand is intended for exhibition in London, was drawn out of the Edmunds Main colliery, near Barnsley. It measures five feet square and three feet thick, and weighs about a ton and a half, including both the hard and soft seams.

**APPLICATION OF MOTIVE POWER.**—Some important discoveries have been made by Mr. George Beesley, C. E., of Kemington, England, to whom must be given the honor of showing that when used for locomotive purposes a wheel rotates upon its periphery, and that advantage is gained by setting the cranks dead fore and aft, or at 180° from each other. The impossibility, or otherwise, of encountering a dead point with the cranks so set has been supposed by some engineers to have been already ascertained, but their mistake probably arises from their having used the wrong kind of engine. Mr. Beesley's intention appears to be to run locomotives with two separate (perhaps two on each side of the boiler) single-acting condensing engines, "as the strokes of the two engines occur alternately." Amongst the advantages of the invention Mr. Beesley claims that by its use much lighter engines than those now employed will have sufficient adhesion to draw an equal load, so that he would seem capable of entirely superseding a previous suggestion for using putty around the driving wheel tires for the same purpose. By way of appendix he gives a curious little treatise upon the application and resolution of force, which will certainly not subject him to the charge of plagiarism upon the writings of recognized mathematical authorities who have preceded him. Throughout the pamphlet there is evidence of freedom of thought seldom met with, so that it is well worth perusing.

**FORESTRY.**—Franklin B. Howe, of Lowville, Lewis county, N. Y., has been appointed, under act of Congress, to prepare a report on forest trees. He begs assistance from botanists, entomologists and others. He wants names of native timber trees in any section, accounts of cases in which after destruction of one kind of timber another has come up, accounts of experiments in forest planting, effects of climate on trees or of forests on climate, insect ravages, or other facts of interest.

**ELECTRIC SIGNALS.**—During the past year a patent electric system has been introduced on the trains of the Philadelphia, Wilmington and Baltimore railroad. This system supersedes the present bell and cord arrangement to communicate with the engineer, and also gives a continuous automatic alarm on the locomotive whenever any portion of the train becomes accidentally detached. The arrangement is also applied to freight trains.

## GOOD HEALTH.

## Vegetation and Health.

The *Popular Science Monthly* does not forget occasional articles on hygiene and kindred topics. The August number has several papers of interest to the hygienist, from which we make a few extracts. In a paper on the "Climate Influence of Vegetation," we find the following paragraphs: The exhilarating influence of a woodland excursion is not altogether due to scenic effects and imagination. Forests exhale oxygen, the life-air of flames and animal lungs, and absorb or neutralize a variety of noxious gasses. Scirrhus affections of the skin and other diseases disappear under the disinfecting influence of forest air. Dr. Brehm observes that ophthalmia and leprosy, which have become hereditary diseases, not only in the valley of the Nile, but also on the tablelands of Barca and Tripoli, are utterly unknown in the well timbered valley of Abyssinia, though the Abyssinians live more than 100 geographical miles nearer to the equator than their afflicted neighbors.

The valley of the Guadalquivir, as late as a century before the discovery of America, supported a population of 7,000,000 of probably the healthiest and happiest men of Southern Europe. Since the live-oak and chestnut groves of the surrounding hills have disappeared, this population has shrunk to a million and a quarter of sickly wretches, who depend for their sustenance on the scant produce of sandy barrens that become sandier and drier from year to year.

It would be exaggeration to say that the barrenness of a treeless country is an evil without remedy. Nature is always ready to assist in any work of regeneration, and there is no desert so void and naked that it might not be reclaimed in the course of half a century. The Khedive of Egypt has wrested land from the sand wastes, as the Hollanders win it from the sea, and by a cheaper process than the building of extensive dikes. By planting date-palms and olive trees, Egypt has added many hundred square miles to her arable surface, and, as Baka-Pasha assures us, her annual rainfall has almost doubled. Between Karnak and Soodan, the rain-gauge shows now a yearly average of sixteen inches, where nine inches was the maximum before 1820. And not only the limit of these tree plantations, but also the adjoining districts, have been benefited; on the table-land of Wady-Halfa the present temperature is not nearly as oppressive as it was within the memory of men now living, and currant bushes and wild mulberries have sprung up where they never grew before. In France, too, the government has reclaimed the *Landes*, a sandy steppe on the southwestern coast, by planting willows and bay trees; and even Algeria has been improved by the persistent tree culture of the French colonists.

## What an old Miller Thinks.

What an old miller thinks about flour, as related to health and nourishment, is worth a moment's reflection. R. Moody, of Maine, writes to the *N. Y. Tribune* as follows: On farms that have been cropped many years, and have not been supplied with enough of the proper kind of plant food to perfect the growth, wheat is much inferior in quality as well as in quantity to what it was half a century ago. Fifty-five or fifty-six years since I began flouring wheat in this place, and am now doing the same (at 72 years of age), and can see a marked decline in the condition of the grain as it is brought to the mill; but I have never seen or heard of any process by which I thought flour from any quality of wheat could be improved further than to free it from all foreign substance, and clean perfectly the exterior of the wheat; then if the wheat is perfected in growth and well cared for, it is, when well ground and bolted, fit food for man, but better if not bolted or sifted at all. I think fresh ground the best; ago will whiten the flour, but all improvement in whiteness (if it is an improvement) causes corresponding depreciation in strength. And yet the present strife among millers seems to ascertain who shall lead in making the whitest flour, and especially the whitest from the middlings. The result is that the manufacturer who makes the whitest from sound and clean grain deprives the consumer of the most life-sustaining elements. The manufacturers spend millions in improved machinery to divest the flour of its most essential parts, which the consumers have to pay twice dearly for; first, the great cost of machinery in cash; second, and most essential, the enervating condition of the physical system, which in these days, is not over-taxed with nerve-food or sunlight. But so long as the eyes of the masses are their gods, I presume they will subject both the inner and outer man to all kinds of torture for this visionary gratification.

**WHY GOLD CHANGES COLOR.**—It is well known, says the *Jeweler*, that the human body contains humors and acids, similar in action to, and having a like tendency towards, baser metals, as nitric and sulphuric acid have, viz., to tarnish and dissolve them, varying in quantity in different persons; and of which theory we have abundant proof in the effects which the wearing of jewelry produces on different persons. Thousands wear continually, without any ill effect, the cheaper class of jewelry with brass ear-wires, whilst if others wore the same article for a few days, they would be troubled with sore ears; or, in other words, the acids contained in the system would so act on the brass as to produce ill results. Instances have occurred in which articles of jewelry of any grade below 18 carat have been tarnished in a few days, merely from the above-named cause. True, these instances are not very frequent; nevertheless it is as well to know them, and they are sufficient to prove that it is not in every case the fault of the goods not wearing well—as it is generally called—but the result of the particular constitution by which they are worn.

**HOW POISONS ARE SPREAD.**—G. Owen Rees, Consulting Physician to Guy's Hospital, London, has called public attention to some unexpected sources of arsenical poisoning. The green calico lining of bed curtains has been found to have produced, for months, severe symptoms, which were treated as those of natural disease, without benefit to the patients. When the curtains were removed the patients at once recovered their health. The beautiful pale-green muslin, largely used for ladies' dresses, has been found to contain not less than 60 grains of the arsenical compound known as Scheele's green in every square yard. He suggests that, in order to prevent much of the nausea, vomiting, headache, inflammation of the eyes, etc., from which so many suffer, there be a prohibition of the manufacture of such deleterious fabrics. Red, scarlet, and mauve-colored fabrics are not always free from arsenic. He adds that the agitation of skirts in dancing discharges arsenical poison, which probably causes some of the pallor and languor almost always wholly attributed to ill-ventilated and crowded rooms and bad champagne.

**LEMONADE.**—It is not in vain that nature has given us a taste for lemon juice, and that some persons have often a craving for it; this indicates a want of the system. Ships going on long voyages now take lemon juice on board as the best antidote against scurvy, that dread of the mariner, and the result of the privation of vegetable food or fruit, for which lemon juice is a general substitute.

We notice an item of the effectiveness of lemon juice in another form of impurity of blood, of which carbuncle is a symptom and an outlet at the same time. Dr. Gibbons, having been a sufferer from carbuncle, relates his own case, in which lemon juice (for which he felt a desire) seemed to have a most beneficial effect. Wine, whiskey, tonics, and all the usual remedies, gave him no relief, and did not help digestion. As soon as he took lemon juice digestion improved, as well as the local symptoms; and the effect was such that he intends to treat his patients in the same way. We have found in other diseases lemon juice a most grateful remedy, especially where (as Dr. Gibbons mentions in his own case) there is a desire for acid drinks and vegetables.

# MINING SCIENTIFIC PRESS

W. B. EWER..... SENIOR EDITOR.

DEWEY & CO., Publishers,

A. T. DEWEY, GEO. H. STRONG,  
W. B. EWER, JNO. L. BOONE.

Office, No. 202 Sansome Street, N. E. Corner of Pine Street, San Francisco.

## Subscription and Advertising Rates:

ADVERTISING RATES.	1 week.	1 month.	3 mos.	12 mos.
Per line.....	.25	.80	\$ 2.00	\$ 5.00
Half inch (1 square).....	\$1.00	\$3.00	7.50	24.00
One inch.....	1.50	4.00	12.00	40.00

Large advertisements at favorable rates. Special or reading notices, legal advertisements, notices appearing in extraordinary type or in particular parts of the paper, inserted at special rates.

Four insertions are rated in a month. SUBSCRIPTION IN ADVANCE—Postage paid—one year, \$4; six months, \$2.25; three months, \$1.25. Remittances by registered letters or P. O. orders at our risk.

WRITE FOR THE MINING AND SCIENTIFIC PRESS. We invite not only professional men, but practical miners and mechanics to contribute to our columns. All communications will be kindly treated. Authors, as well as readers, will be benefited by corresponding.

THIS ORIGINAL ARTICLES in this paper are mostly set in solid type, giving in our columns one-third more reading than is contained in ordinary leaded matter.

Address all letters to the firm, and not to individual members, or others, who may at any time be absent.

Our latest forms go to press on Thursday evening.

SAN FRANCISCO:  
Saturday Morning, August 25, 1877.

## TABLE OF CONTENTS.

**GENERAL EDITORIALS.**—Items of Interest from the Mines; New Method of Making Propeller Patterns; Academy of Science; Saws, a Fine Exhibit; Fine Castings, 113. The Week; Mistakes and Failures in Coal Mining; Foundry Notes; Mine Management, 120. An Important Mining Decision; Dennison's "Ingratator" Dredge; The Iron Steam Launch; Comparative Values, 121. The Mechanics' Institute Library; A Handy Workman; Patents and Inventions, 124.

**ILLUSTRATIONS.**—Plan of Making Propeller Castings, 113. Dennison's "Ingratator" Dredge, 121. **MECHANICAL PROGRESS.**—Heating to Forge; Casting Nickel and Cobalt in Germany and in Birmingham; Pulverizing Minerals; Steel Locomotive Boiler; The Value of Small Inventions, 115.

**SCIENTIFIC PROGRESS.**—Discovery of Oxygen in the Sun by Photography; India-Rubber; Indian Burial Customs; Free Instruction in Technology; The Nashville Meeting, 115.

**GOOD HEALTH.**—Vegetation and Health; What an Old Miller Thinks; How Poisons are Spread; Lemonade, 119.

**USEFUL INFORMATION.**—Science and the Sea Serpent; Painted Roofs; Horseflesh for Human Food; Application of Motive Power; Forestry; Electric Signals, 119.

**MINING STOCK MARKET.**—Sales at the San Francisco, Pacific and California Stock Boards; Notices of Assessments, Meetings and Dividends; Review of the Stock Market for the Week, 116.

**MINING SUMMARY** from the various counties of California, Nevada, Arizona, Montana, Oregon and Utah, 117-124.

**MISCELLANEOUS.**—The Pacific Coast; The Granite Creek Mines; Salt for Working Ores; Prospecting in the Elk Mountains, 114. List of Exhibits of the Twelfth Industrial Fair of the Mechanics' Institute, 118-122. Mining for Gold Black Sand, 119. The Burleigh Tunnel, 123.

**GENERAL NEWS ITEMS** on page 124 and other pages.

## The Week.

Nothing of any great importance in connection with the mining interests has occurred during the past week, except the decision in the Eureka Consolidated mine case. As detailed in another column, this company brought suit against the Richmond Consolidated, an English company, on the ground that they were trespassing on the Eureka's property in following their ore. The decision is one of great importance to the mining community, as involving the question of "heds" or "lodes." The Court says, it seems, the various acts of Congress do not define the word with distinctness. The definition given of a lode by geologists is a fissure filled with mineral matter. But miners used the word before it was defined by geologists, and made the definition first. By their meaning the word "lode" means such a formation as enables them to trace the deposits which they are seeking. It seems by the definition of the Act of Congress that the legislators endeavored to avoid adhering to the definition of geologists, leaving courts free to accept the miners' definition. Our interior California exchanges do not contain much on mining matters at present, politics being the main theme discussed; so that we have no news of any great changes to report. The gravel mines are nearly all shut down, waiting for the rain; but, in the meantime, the owners are preparing their ground for work in the fall. The season has been short this year, but the time for preparation has been so long that the claims are in good order for the winter's campaign.

ANTIMONY is quoted in Liverpool at £48 to £49 per ton for French Star regulus.

## Mistakes and Failures in Coal Mining.

There have been on this coast not a few failures in mining for the precious metals, and the mistakes made before, and even after, experience was gained, have been numberless; but these mistakes and failures have also extended to the coal mines, where the experience of others should have served as guides. At Coos Bay, for instance, where the most extended coal fields on the coast exist, there has been a wasteful expenditure of money by thoroughly incompetent, if not in some cases dishonest parties, in searching and mining for coal. Mr. W. A. Goodyear, in his recent work on the coal mines of the western coast, says that it would not exceed the truth to assert that, since 1870, there has been expended in this way an aggregate sum of not less than half a million dollars; every dollar of which is a total loss, and at least nine-tenths of which would certainly have been saved if the advice of a competent engineer had been sought and followed.

As it has been a time-honored practice, among the gold and silver miners of California and elsewhere, to erect a costly mill with all its appurtenances for crushing, amalgamating, etc., before the mine was sufficiently developed to prove whether there was anything in it worth crushing or not, so the usual practice in Coos Bay has been to build railroads, wharves and bunkers before any coal worth mining was found; and, in more instances than one, under circumstances where there never was any reasonable probability that any coal would be found which would pay to mine.

Mr. Goodyear, in the work alluded to, instances several of these failures. In the Hardy mine, a tunnel and gangway, with a view to furnishing them with double tracks, were foolishly driven twice their necessary size; a bunker was built at the mine capable of holding 1,000 tons of coal; a railroad was built, 3,700 feet in length, from this bunker to the landing, and at the landing a high and costly wharf was also built. And all this on a mine, where, although the croppings looked well enough, the coal below was soft, and crumbled badly on exposure. The bed itself was rolling and irregular, and the roof soft and weak. It is believed that over \$150,000 were sunk in this excitement. It is certain that a large sum was expended on outside improvements and works, of a character which contributed nothing towards proving the real value of the mine, and which themselves possessed no value as soon as the mine proved worthless.

A large sum of money was also spent on the Utter mine, where bunkers were erected, and a railroad, wharves, etc., built, although the location was such that the cost of transporting coal to the navigable water prevented successful competition with mines more favorably situated. The North Pacific Coal Company's property also cost considerable money, but to which the cost of transportation was fatal from the beginning.

The most conspicuous and inexcusable mistake detailed by Mr. Goodyear was that involved in the opening of the Hardyville mine; and it would be difficult to find in the annals of coal mining anywhere an instance of grosser ignorance and incapacity, combined with more reckless folly, than was displayed here. The locality is on the right bank of Isthmus slough, some three miles above Coos City, and at about the head of any practicable navigation on the slough. It is close to the water's edge, and the situation would have been good enough if a mine had existed there. But there was never any reasonable evidence of any probability of the existence at this property of a pound of coal which would pay to mine. There is, however, a heavy bed, some seven or eight feet thick, of alternating layers of clay slate "bone" and other worthless material, including some soft and dirty coal, which strikes about north and south and dips to the east. Upon this bed a slope was started down—not in the direction of the slope of the bed, which, as just stated, would have been about east—but obliquely to it, with a course of about N. 53° E. This slope was continued down in this direction, following approximately the general course of the plane of the bed, through faults and disturbances of various kinds, and with an average pitch of about ten or twelve degrees, for a distance of some twelve hundred feet, without any visible improvement whatever in the character of the materials which constitute the bed, and with no other result than that of demonstrating the fact that this bed, worthless as it is anyhow, is also considerably broken by faults and other disturbances. This was the mine; but this was not all. A pair of costly and very handsomely finished steam engines—said to have been originally built for use in the Palace Hotel in this city—were purchased and set up and erected there for hoisting engines. Boilers, pumps, etc., were supplied, of course, and a small town was built. A bunker was erected on piles in the water near the middle of Isthmus slough, capable of holding nearly 1,000 tons of coal. A track from the mine to the top of the bunker was laid over a trestle work, also on piles, some 900 feet in length, and about 50 feet above high water in the slough. No screens were furnished either at the mine or at the bunker, it being asserted that "this coal was of such superior quality that it needed no screening, the fine being as good as the coarse." Moreover, the bunker itself was divided in its interior by

vertical cross-partitions running from top to bottom, with ten separate compartments. This was for the purpose of keeping separate from each other as many different qualities of "superior" coal, all of which, it was expected, would be obtained from this same utterly worthless bed. On the same property, in another locality, considerable money was spent in sinking a slope 500 feet in a place where there was abundant evidence on the surface that the rocks were badly crushed and broken, as they were found to be in the slope itself.

It is stated on good authority that the amount of money spent on this Hardyville property alone considerably exceeds \$200,000. Nearly the whole is a dead loss, and one that would never have happened if any competent person had been sent to examine the mine in the first place.

## Foundry Notes.

Work at the various foundries and machine shops continues slack, and times are dull with them as with other branches of business, at present. There is, of course, the usual amount of small work going on, but there are few large mining orders in the shops.

### The Golden State and Miners' Iron Works.

The Golden State Iron Works and Miners' Foundry have joined forces under the above name, and formed an incorporated company, with the following Directors: Cyrus Palmer, H. B. Angell, W. L. Palmer, I. W. Knox and R. F. Knox. The lease of the Golden State on its old premises having expired, the ground was bought by Huntington, Hopkins & Co.; so they were compelled to move after being in the same location for upwards of 15 years. An arrangement was then made with the old Miners' Foundry, to form a joint company, and concentrate the business of both shops in one location. The machinery, etc., of the Golden State has been nearly all moved to the Miners', on Front street, near Folsom. At these premises there are four water lots, and, in the rear, two forty-foot square lots. The buildings are being enlarged and improved, to make them more convenient, and allow the managers to do any kind of work. The tools of the Golden State are all as good as any, but they had no large lathes or planers to admit of heavy work; but now, with the tools of both foundries, the new company will be able to undertake any job without having to send part of the work outside. The Golden State, which was originally the Sutter Foundry, is among our oldest shops, and the Miners' was also established a good many years ago. The combination will be of advantage to both parties, as their facilities will be increased greatly, and they will now be able to do any class of work.

### At the Pacific Iron Works

They have nearly completed the machinery for a large and powerful steam tug for Adams & Taylor. The engines are compound, and the machinery will be complete to put in the boat. The large cylinder is 34 inches, and the small 20 inches, by two-foot stroke. They are also compounding the engines of the steam tug *Brennan*, fitting surface condenser, etc. A 12-inch engine and hoiler are being made to go to Mexico for a mine, and a 10-stamp battery is being built for the same destination. The machinery is being built in sections for packing over the mountains. These works are engaged in the construction of a large sugar mill, with 12-inch rolls, vacuum pan and engine, to go to the Sandwich Islands. This is the largest sugar mill ever built on this coast, and is on the plan of the large Eastern mills. They have just completed a new style of revolving quicksilver furnace, which is being set up at the mine at Steamboat Springs, Nevada. It is called Thompson's improved rotary quicksilver furnace, and is something like the White, changed to be adapted to the working of the ores of mercury.

The Pacific Iron Works have made arrangements to manufacture the celebrated Walker compound steam pump, recently described and illustrated in the MINING AND SCIENTIFIC PRESS. Messrs. Parke & Lacy are still agents for the sale of the pump, but these works will manufacture them on this coast instead of having them shipped here. They are coming into great favor as a mining pump.

The Pacific is putting up a 20-stamp mill and hoisting works for the Star company, at Cherry creek, engine and all complete, with two Howell rotary furnaces. Two of these furnaces are also being made for the Grand Prize mine.

### The Howell Rotary Furnace

Is a new design, somewhat on the general plan of the White, with some new principles. It has been tested for some time on the Comanche and Indian Queen mines, at Benton, Mono county, and found to be very successful. It is patented by John Howell, of Benton, and is intended for chloridizing silver ores and desulfurizing copper, gold, lead and zinc ores. The revolving tube is arranged on carrying wheels with one end opening into the upper furnace chamber, and the other into a lower furnace into which the ore is discharged from the tube after treatment in it. The tube is made in sections, having flanges, the upper section being smaller than the lower ones and connected by middle sections of intermediate sizes.

The tube is arranged to descend a little from the upper to the lower end, and contains three spiral flanges to urge the ore along from the upper to the lower end. One of the carrying wheels is toothed to turn the tube. The carrying wheels, on which the upper end of the tube rests, are on bearings which are capable of sliding toward and from each other, to raise or lower the tube, to adjust its inclination; and the plates surrounding the tubes at the openings into the furnace are adjusted to allow the tube to be properly placed. Beside the furnace for generating the heat at the lower end of the tube, there is a furnace at the upper end for generating heat for chloridizing such fine particles of ore as may be carried out of the furnace by the draft before being sufficiently chloridized; the heat from said furnace being discharged into chambers for that purpose, along with the heat from the tube, and passing therefrom into another chamber for thoroughly doing the work before escaping into the air. In the furnace being made at these works the cylinder is reduced from 40 to 31 inches. It is claimed to be a great improvement in this class of mining machinery.

## Mine Management.

Sometimes, when one thinks of the abuses which have occurred and the money which has been wasted or misappropriated by managers of companies, it looks as if our system of incorporations was all wrong and should be abolished for this reason alone. With one, two, or half a dozen men having supreme control of the accumulated money of a thousand others, and the direction of disbursements, purchases, etc., it is little wonder that we hear of so many abuses; more especially when it is remembered that men are often put into such responsible positions without any of the necessary qualifications, except shrewdness and a willingness to further the interests of the individuals to whom they owe their places.

In our mining companies these irregularities are more frequent than pleasant, and have done more to injure the mining interests of the country than any other thing; and we think, with the *Gold Hill News*, that the searching investigations which have been recently made into the management of some of the mines and the measures taken to reform discovered "crookedness" and mismanagement have exercised a good influence. At any rate, the effect of these investigations and reforms cannot fail to be highly beneficial, and they should be extended to every mine along the great lode. When stockholders can see and know better where their money goes to, and that it is not being stolen, squandered or otherwise misappropriated, then, and not till then, can they feel a return of confidence, and a greater willingness to invest their money or pay their assessments. The reform in Ophir was most certainly a good one, and the changes in both that mine and the Savage were decidedly judicious and beneficial. Some other companies are instituting reforms in the matter of salaries, and cutting down all unnecessary expenditures. These reforms will call for less assessments, a gratifying point to stockholders. Because there happen to be \$30,000 or \$40,000 in the company's safes resulting from the levying of assessments, there is no reason in a Superintendent studying out means to open it in all sorts of ways. The development and prospecting of the mine, which should be the first consideration, is too often the last; and then men in charge take advantage of these positions and get commissions here and there and everywhere, all of which in the end come out of the company. And this in the face of the fact that Superintendents generally have very good salaries and comparatively easy positions. Of course all are not alike, and it is fortunate they are not; but recent events have proven that some of those longest at the business were not so trustworthy as was imagined.

These things exercise a very hurtful influence on mining matters. If people are called upon to pay assessments upon their stock they like to feel that it is for actual development of the mine. If they have any impression that their money is doing more to enrich a Superintendent than themselves, they naturally hesitate about paying. Several investigations which have occurred this year have proven that "irregularities"—to use a mild term—are more common than was supposed, as scarcely one of the investigations failed to show up transactions which in any other kind of business would have made an outcast of the perpetrator. The more thoroughly the mining interests can be purged of the class of men referred to, the better will it be, and we are glad to see that the public is opening its eyes to the evils in a manner which shows some earnestness of desire to break them up.

ENTRIES AT THE FAIR.—We give in this issue a complete list of entries to date, at the Mechanics' Institute fair, so that our readers in the interior may have some idea of the variety of articles exhibited. New exhibits are continually being made, so that all the available space is pretty well filled. The fair is in every way a success, both financially and otherwise, and is daily and nightly visited by thousands.

## An Important Mining Decision.

On Monday a decision was rendered, in the United States Circuit Court, in favor of the plaintiff in the celebrated case of the Eureka Consolidated vs. Richmond. This important case has been on trial for some time past, during which time a large number of experts were examined, and their testimony, when printed, will make a book as large as any one on geology yet published. The opinions, however, will be more diversified than is usual in such cases, and some of the statements made are entirely original, never having appeared in any work on geology, mining, or any anything else.

The action was in the nature of an ejectment, and suit was brought in the United States Circuit Court by the Eureka Consolidated to perfect title, the Eureka claiming that the Richmond Consolidated company was trespassing on their ground. The Eureka Consolidated—the plaintiff in the case—held that their ore body was continuous, while the Richmond set up a theory that they were working on a pipe vein which they could follow indefinitely, even though it penetrated the patented lines of the plaintiff. The Eureka Consolidated claimed that the famous Pott's chamber, this great ore body from which the Richmond has taken a vast amount of bullion, was really the property of the Eureka; but the Richmond held that this was a portion of their pipe vein. The defendant claimed the right to follow the vein or ore cropping on their ground as far as they pleased, irrespective of the patent covering the adjoining ground.

The value of the ground contended for was between two and three million dollars, and the trial was conducted by some of the best mining lawyers on the coast. The suit was originally brought in Nevada, but was transferred to this city by agreement. The counsel for the plaintiff embraced Solomon Hydenfeldt, Garber & Thornton, R. S. Messick and H. K. Mitchell; and for the defense, Wren & Thornton, S. M. Wilson, Williams & Thornton and Messrs. Hillhouse and Lansing. The representatives of the two corporations were General George S. Dodge, President of the Eureka Consolidated, and Mr. Prohart, Managing Director for the Richmond Consolidated mining company.

The decision read by Mr. Justice Field was a long and carefully studied document, in which the rival claims were closely scrutinized, the result being that all points in the controversy were settled in favor of the Eureka Consolidated company. The defense had claimed that the Act of 1866 allowed the locator to follow a vein into the adjoining land; but the miners, for whom this Act was framed, meant that the locator could follow a vein to the extent of the number of feet on the surface, else he might oust all his neighbors and take the entire ledge. This construction of mining rules is given in every mining district. This patent does not authorize a patentee to go outside of the surface lines. The line on the side of the claim, and not the line on the end, may be taken. The line taken does not measure the extent of the miner's right, as carving out a section of the lode beyond which he cannot pass. The diagram of a location must embrace more than lineal measurement. The Act of 1872 allows a locator the dips, angles and spurs of a vein cropping on his location, but not beyond the limits defined by the Act of 1866.

The opinion concludes as follows: "Our opinion, therefore, is that both the defendant and the plaintiff, by virtue of their respective patents, whether issued upon locations under the act of 1866, or under this act of 1872, could only follow the veins or lodes lying within lines drawn vertically downward at the end of the respective locations, and that each take the ores found in all veins and lodes the apex or top of which lay within these lines. The same conclusion would be reached if we looked only to the agreement of the parties made the 16th of June, 1873. Our finding is, therefore, for the plaintiff, and judgment must be entered thereon in its favor for the possession of the premises in controversy."

Signed, Field, Presiding Justice; Sawyer, Circuit Judge.

Justice Field stated that Judge Hillyar, of the Nevada Circuit, concurred in the opinion.

Counsel for the Richmond mine asked a stay of proceedings for 20 days, and also for special findings.

Mr. Justice Field objected to the latter request on the ground that the Court had already been overworked in the case, and he therefore desired counsel to prepare the findings.

As a result of the decision, it is stated that the Eureka Consolidated will immediately sue the Richmond for damages in the sum of \$2,500,000; but it seems pretty tough on the English company to lose the property in dispute and have to pay out a sum also for ore taken out. The decision, however just, will act to the detriment of the mining interests of this coast, as far as English capital is concerned, for the English company will hardly feel satisfied with the result, and will lay it to prejudice more than to law. They have very little confidence as it is, and this reverse will hardly be accepted with equanimity by those who have invested so heavily and lost. Of course, in a court of law, no such considerations would have the slightest weight, but it will be difficult to make our English cousins believe it.

At Eureka there was great rejoicing on receipt of the news of the verdict. The Eureka Consolidated's whistles screamed for an hour; miners and citizens grew enthusiastic, and for a time a large portion of the population was given over to demonstrations of approval. The friends of the Richmond were, of course, correspondingly depressed. One of the immediate effects of the decision will be the starting of two more furnaces by the Eureka Consolidated, and the employment of an increased number of men in the mine. As the town has been full of unemployed men waiting for the decision, it has given many of them work, which they sadly needed.

## Dennison's "Ingurgitator" Dredge.

This dredging machine, as its name indicates, is constructed on the suction principle. It raises the material from the bottom of a river, lake or bay, and conveys it to any distant point either over land or water. As a levee builder it is unexcelled. It has long been known that mud taken from the bottom of a river will make an embankment of peculiar strength when once it has settled and dried, and not easily destroyed by overflow of water. This machine takes advantage of this fact and works to double purpose, by deepening the channel and procuring the best material for a levee at the same operation. It mainly consists of two steam vacuum pumps provided with suitable telescope suction pipes, extending to the bottom of the water, through which the mud is raised by a vacuum produced by filling the cylinders with steam

DENNISON'S "INGURGITATOR" DREDGE.

and then condensing it. The mud is forced from the cylinders into a pressure tank, and from there forced through pipes to the discharging point.

This machine has been in operation at Union Island, San Joaquin river for near six months, raising a thousand cubic yards per day with a three foot cylinder. It is to be put to mining in some of our river beds also, as this new system of mining is becoming quite popular in the upper rivers. We may soon expect to see the suction tubes feeling their way over the beds of our gold bearing rivers, searching for the precious metals like an elephant's trunk hunting for a pin in a bucket of water, and on the same principle.

Persons desiring to examine this machine can see it in operation at the above named place, or plans of it can be seen at the office of David Jennings, Fireman's Fund building, corner of Sansome and California streets.

**THE LICK ESTATE.**—The action instituted by Richard S. Floyd and the rest of the Lick Trustees against John H. Lick, administrator, having for its object the judicial sanction of the compromise by which the Lick heirs are to be paid \$385,000, in addition to the original bequest, came up in the Nineteenth District Court on Saturday, and is still occupying the attention of that Court. All the heirs and beneficiaries accepted the compromise, by which the additional sum is to be deducted from the residue of the estate, except the California Academy of Sciences, which organization demands that this additional sum shall be deducted pro rata from each legatee. The latter party filed a demurrer to the complaint, setting up that the Court has no jurisdiction of the subject of the action; that the plaintiffs have not legal capacity to sue; that there is a defect of the parties defendant, in that John H. Lick in his individual capacity is not made a party defendant, and that the complaint does not state facts sufficient to constitute a cause of action.

LEAD is selling in Liverpool at £20 to £20 7s 6d per ton for good ordinary brands.

## The Iron Steam Launch.

The little iron steam launch in the machinery department of the pavilion, exhibited by Hall & Kelshaw of the Sacramento Boiler Works, on Fremont street, attracts considerable attention and comment. It is the first one of the kind ever built on this coast, and was put up to show what could be done here in this line.

The launch is 28 feet over all on deck and 25 feet keel. She is five feet four inches beam and three feet deep. The keel plates are of No. 14 and the rest of the shell of No. 16 iron. The angle iron is inch by inch by one-eighth. The beams are inch and a half by inch and a half by one quarter. A water tight compartment is constructed across four feet six inches from forward. This answers a double purpose. It is intended to carry the supply of fresh water for the boilers, and in case the launch gets stove forward she will not sink.

The little vessel is not entirely completed. The forward and after end ends are left open so that the construction can be examined, and people can see the method of iron ship building. She will have an iron floor from the bulkhead to within four feet of the stern, for the engine and boiler to rest on. The boiler and engines are in process of construction and if completed before the fair closes will be placed in position for exhibition. All the frames in the launch are tied with angle iron and plate from a nine-inch level. The rivets are three-sixteenths in the shell and one-quarter inch in the angle iron. The builders of this launch have had consid-

## Comparative Values.

Whenever anybody strikes a prospect in any of the silver-mining districts on this coast, now-a-days, and finds a few tons of ore, it invariably corresponds in appearance with the bonanza ore, only it is considerably richer. Comparisons are then entered into, which make the bonanza appear small and insignificant beside the new "find." And the figures look so satisfactory that the sanguine proprietor sometimes succeeds in forcing his belief on credulous friends, who, on a slight investment, have visions of fabulous wealth, compared with which the riches of the bonanza kings are small indeed. They seldom think of the years of toil, uncertainty and doubt, and the enormous expense of prospecting entailed in opening and developing a first-class mine, any more than they do that the chances of finding such a body of ore, in an ordinary mine, as exists in the Consolidated Virginia and California mines, is about a thousand to one. People are not only fooled once, but half a dozen times under just such circumstances, and still the thing continues.

We are led to these remarks by the sanguine statements of the Colorado Springs Gazette, with respect to the stocks of some of the San Juan mines. It says that stock has been issued and placed upon the market in many instances, and commands such a low figure as to excite ridicule. In most cases the mines of these corporations are known to be rich, and the only reason generally assigned for the extremely low price is the large amount issued. In our opinion this is a very good reason indeed, as has been proven in our experience in the San Francisco stock market. When stocks are cut up and divided into many thousands or hundred thousand shares, they cannot be sold for the price they would if in smaller parcels. This used to be the case, and is one of the reasons why our stocks have been divided to so great an extent. The game is played out, however, as a glance at the prices of stocks in San Francisco will show. The bonanza mines are exceptional in every respect, and do not offer a fair basis of comparison.

Still our cotemporary goes on as follows, comparing the San Juan stocks with the famous bonanzas: "The celebrated Consolidated Virginia claim was originally 1,310 feet in length, and, as organized, issued 11,600 shares, of \$50 each, and the lowest price they ever brought was two cents on the dollar, which would make an aggregate of \$11,600. The present length is 710 feet; the number of shares has been increased to 540,000, which are quoted at from \$43 to \$46 per share, which would make the present value of the mine, together with the California (600 feet), which was stricken off, between \$46,000,000 and \$47,000,000. Here we have the San Juan Consolidated mining company, 20,000 shares, of \$100 each, selling at from two to three cents on the dollar; the Graham silver mining company, with about the same amount of stock, and commanding about the same price, and several others that we might mention. These prices are far in advance of what the Consolidated Virginia brought in its youthful days, and this shows conclusively that some of the San Juan mines have a good name already."

After the latter statement we do not see what the Gazette has to complain of in thinking the mines of San Juan are selling at ridiculously low figures compared with their value. Is, perhaps, not aware that it is the general custom here to incorporate with \$5,000,000 stock in 100,000 shares and then sell the shares at "bed-rock," for 25 cents to a dollar each; and many consider themselves lucky to get this. Two or three cents on a dollar is not so bad after all, when it is recollected how easy it is to make paper values and how hard to realize cash on such a basis. Scarcely a day passes that one or more companies do not incorporate with "capital" of from \$5,000,000 to \$10,000,000, when the incorporators have not got a \$20 piece in their pockets. If the stock is worth on paper \$100 per share, they will be glad to take 25 cents a share "to prospect with and form a working capital."

These things are so well understood here among mining men that it is scarcely worth while to go into details, and we only mention them to endeavor to persuade people from deceiving themselves with speculations which promise more than the bonanzas. The mines who have earned this title are notable exceptions in the history of mining, and by no means serve as fair examples on which to base comparisons. People who do this deceive themselves, or try to do so, and the longer it is continued the more harm will result.

The deepest point yet attained in the practical workings of any mine on the Comstock, regardless of topographical undulations or inequalities at the surface, is in the Yellow Jacket mine. The 2200-foot level, where all the prospecting and development work of the mine at present is being done, is 775 feet below the level of the Sutro tunnel, or 170 feet below the level of the lowest workings of the Imperial mine, which shows the deepest workings of any mine on the lode. It must be borne in mind, however, that the surface or top of the Imperial shaft is two hundred feet higher than the Yellow Jacket.

L. STRONG, Assistant State Geologist of Wisconsin, was drowned in the Flambeau river, Saturday, while engaged in his geological investigations.

Continued from page 118.

- 445.\* Wiester & Co: powdered toilet soap.  
 446.\* W H Burton: window awnings.  
 447.\* Pacific Rubber Paint Co: rubber paint.  
 448.\* Boca Brewing Co: beer.  
 449.\* Mrs W H Burton: bird cage awning (patent).  
 450.\* Giant powder Co: Giant Co's competition grades, 1, 2, Ex, and 2 Judson.  
 451.\* James Dexter: bon-bons, cake ornaments.  
 452.\* G Rotanzi: bitters, "Long Life."  
 453.\* Carl Eisenschimmel: drawings and writings.  
 454.\* Joseph Brothers: clothing, youths' and boys.  
 455.\* Weed & Kingwell: brass goods—bells, church and gong, steam brass work, plumbers' brass work, Eureka lubricators, miscellaneous brass work.  
 456.\* Wiester & Co: coal oil stove, "Summer Queen," "Complete" washing machine.  
 457.\* California Paint Co: Averil mixed paints.  
 458.\* California Spring Bed and Mattress Co: Crandall spring bed, Lanes patent wool mattress and pillow, hair mattress and pillow.  
 459.\* W F Sherwin: press, punches and dies for button fastener.  
 460.\* C T Merwedel: mechanics tools, foot lathes, California make, and Eastern moulders' tools, and Fleet wood scroll saws.  
 461.\* California Spring Manufacturing Co: bed and furniture springs, double spiral spring and self-fastening bed spring.  
 462.\* Larkin & Co: huggies, sulky, skeleton wagon, phaeton, Surrey wagon on elliptic spring, and do side bars, 2 men side bar huggies, 1 man do, elliptic spring piano box open huggy, elliptic spring piano box top huggy, and rockaway.  
 463.\* Luchsinger & Son: display of furniture, sideboard, bedroom sets, office desk, specimen of wood carving on the sideboard, parlor table and cabinet.  
 464.\* Vanderslice & Co: solid silverware.  
 465.\* Eureka patent carpenter gauge.  
 466.\* H F Rocky: printing presses.  
 467.\* P Beamish: white shirts and gents furnishing goods.  
 468.\* Lancaster & Northon: merchant tailor goods, pants, vests and coats.  
 469.\* Hunter Bros: varnishes and wax sheet.  
 470.\* W W Montague & Co: Van family ranges, Montague French ranges, Eureka portable ranges, metallic refrigerator, marbled iron mantels, granite iron ware, polished copper ware, japanned ware, fine steel fire sets and stands.  
 471.\* A S Hallidie: wire goods—galvanized telegraph annealed fence wire, coppered wire, tin do annealed, Staples' module of ropeway and pulley, submarine cable, and Holloway's fire extinguishers.  
 472.\* S. F. Gas Co: ammonia, commercial preparation.  
 473.\* Detrick & Co: awnings, tents and bags, overhead machine sewing.  
 474.\* S. F. Plating Co: plating and replated ware.  
 475.\* Price Press Co: excavator, hay press.

 477.\* Schultz & Fisher: solid silver ware, home manufacture.  
 478.\* Holbrook, Merrill & Co: ranges—Miller, Bismark, Medallion, Model range, stoves, new Bismark, improved Buck, new Aldine parlor cook, fire side, copper-japanned ware, tin, granite, agate.  
 479.\* Hamilton & Learned: chairs.  
 480.\* Spence & Co: oil stoves and fixtures.  
 481.\* J W Ruves: entrail cord and belting.  
 482.\* Williams & House: vent top, patent fruit can sealer, top cement or wax for glass or earthenware.  
 483.\* Norcross & Co: flags, regalia, embroidery.  
 484.\* Kimball Manufacturing Co: carriages, Imperial coach, 1 and 2 horse, Charahance rockaway, top 2 seat phaeton, 1 do do, top huggies, open huggies, 1 6-seat carriage.  
 485.\* Potrero Curled Hair and Cocoa Fibre Co: cocoa fibre.  
 486.\* Kohler, Chase & Co: piano and musical instruments and drums, Fisher upright piano, Decker Bros, Emerson's and Mason & Hamlin organs.  
 487.\* P Kelly: hoots and shoes, men's, ladies, and children's.  
 488.\* M Davidson: Allen Spring mineral water.  
 489.\* G T Walton: fancy Turkish dress.  
 490.\* C P Bailey: huggy robe and mat.  
 491.\* Golden & Copson: brooms and broom corn.  
 492.\* H P Flint: glass case of California wood.  
 493.\* Dr J E Fraser: Nevada sulphur samples.  
 494.\* S F Produce Exchange: wheat, flour and barley samples.  
 495.\* W H Baxter: Metropolitan roofing and miniature houses.  
 496.\* A H Southwick: turbine windmill.  
 497.\* Power Ongh: one hook case.  
 498.\* J B Stetson: Norman ranges, tinned, copper, granite and Japanned ware, iron tank, Black Diamond and Bellingham hay coal.  
 499.\* John Roach: model of quicksilver furnace.  
 500.\* John Roach: mathematical instruments, solar compasses, surveyors', miners' and engineers' transits, mountain barometer, pedometer, pocket compasses, telescopes.  
 501.\* Miss E. L. Tripp: wax flowers.  
 502.\* Sadler & Borrowes: Victor sewing machines.  
 503.\* R F Osborn: coffin trimmings.  
 504.\* S Foster & Co: condensed eggs.  
 505.\* Peterson & Olsson: emblematic signs and models.  
 506.\* J W & W Cook: pressed salmon.  
 507.\* Johnston, Clarke & Co: Hall treadle.  
 508.\* West Coast Furniture Co: haskets.  
 509.\* Heald's Business College: telegraph office and instruments.  
 510.\* Forty-two specimens of plain and ornamental penmanship and drawing.  
 511.\* G S Thompson: soda fountain and water.  
 512.\* Ridgeway & Jansen: spring mattresses, "Clipper" and common, bolsters, first and second class.  
 513.\* Tuehner & Hoffman: show cases.  
 514.\* D Jacard: one show case of fancy candy.  
 515.\* Wm Rennie: three Boynton's tile stoves.  
 516.\* Mrs D T Phelps: one frame containing a paper named "The Mirror of the Fair," published in 1857, on silk.  
 517.\* E P Danforth: specimens of prepared leather, harnesses, etc.  
 518.\* Mrs Kelsey: one bed quilt.  
 522.\* Miss A Jones: one piece of lace work.  
 523.\* H A Chavlin: assorted cordials.  
 524.\* F B Taylor: sapolio and hand sapolio.  
 525.\* California Tar Oil Works Co: samples of oils.  
 526.\* J D Voerner: cooper work.  
 527.\* J H Culver: one cottage bee hive.  
 528.\* J Pettet: wax work.  
 529.\* Mrs W P Rutherford: shoulder brace, abdominal supporter, health corset, collection of handbags, skirt supporter.  
 529.\* Mrs H Cantel: display of lace curtains which have been cleaned and mended.  
 580.\* W H Campbell: 5 fern trees.  
 581.\* A L Bancroft & Co: 3 church pews, 1 health lift, display of school furniture.  
 582.\* F Midon: 1 case containing specimens of fancy candies.  
 583.\* Miss Carrie L Wood: 1 show case of millinery.  
 584.\* N Weston: one frame of silk work done by hand.  
 585.\* J Lachman: six bbls of chicory.  
 586.\* J G Montenegro: three oil paintings, one crayon, one drawing.  
 587.\* Lily Ransom: two colored ink pictures and frames.  
 588.\* Will & Finck: samples of hell working and electric annunciators.  
 589.\* M Weston: display of patent photographs.  
 590.\* Miss Balkun: 1 oil painting.  
 591.\* M G A Wilkins: specimens of wools.  
 592.\* T L Davidson: 1 frame containing specimens of wool.  
 593.\* Jas Hamilton: specimens on cards of wool.  
 594.\* C W T Herren: specimens on cards of wool.  
 595.\* Clackamas Packing Co: 2 cans of fresh cherries.  
 596.\* W J Kinney: 12 cases of Kinney's roast beef, 4 cases of salmon.  
 597.\* J H Foster: 2 sacks magnolia mills flour.  
 601.\* Mrs M H Batson: log cabin hed-quilt.  
 602.\* W J Cuthbertson: 1 architectural drawing.  
 603.\* S A Kusel: display of shirts.  
 604.\* Mrs C J Harper: 6 pieces lace work, 2 tidies.  
 605.\* Low & Chartrey: 1 steam washing machine.  
 606.\* Synovial Oil Agency: 3 glass jars oil, 2 tin cans and 4 dozen bottles sample oil.  
 607.\* F M Gilbert: 1 oil painting.  
 608.\* Mrs A Boaman: 1 braided mat and 2 spreads.  
 609.\* Madam Mourgeanna: 1 embossed work in frames, 2 oil pictures, display of toilet and fancy articles.  
 610.\* Mrs Sarah King: 4 pieces worsted work.  
 611.\* Wm Andrews: 1 case fancy woodwork.  
 612.\* W H Campbell: 3 Aberdeen red granite monuments.  
 613.\* E Rahjohn: display of Australian war weapons.  
 614.\* T J Rahjohn: 1 crayon picture.  
 615.\* Mrs Wm Derby: 1 worsted work picture.  
 616.\* Mrs M Durdal: 1 pencil drawing.  
 617.\* Mrs Annette Jones: 1 basket wax flowers.  
 618.\* Mrs E J King: 2 quilts.  
 619.\* Miss Rydhger: 1 case wax flowers.  
 620.\* Madam Anna Getz Lucas: 1 frame autumn leaves, 7 cases preserved flowers, 1 case natural dried flowers, 1 case colored dried flowers, 2 cases preserved dried flowers without wax, 1 basket colored flowers.  
 621.\* Mrs MacHenry: 1 oil painting, 2 panel paintings.  
 622.\* J W Cherry: 1 glass sign.

 676.\* Wm Wehmoller: display of corrugated stovepipe elbows.  
 678.\* Mrs M V Kemhall: 1 frame natural hair wreath.  
 679.\* H C Root: 1 elipsograph, 2 saw sets and clamp combined.  
 680.\* Mrs W H Worth: 1 frame hair work.  
 681.\* H L Judell: 2 large glass show cases containing samples of ladies and infants underwear goods.  
 682.\* Mrs W F Ferguson: one spice wreath in frame.  
 683.\* Louis W Beanman: 1 sample board set caps and other screws, 1 sample board of nuts and washers, 1 sample board of malleable iron castings, 11 axes, 1 set of Whitney side bar springs attached to a huggy bottom, display of steel castings.  
 684.\* A O Cook: 10 frames of preserved flowers, 2 vases of wax statuary.  
 685.\* Chas A Hawley: 1 model Smith's patent sash balance.  
 686.\* Mrs J Kenneff: 1 frame of sea moss.  
 687.\* C Adolph Low: 10 cases salmon.  
 688.\* M Freud & Son: corsets, underwear and hussies.  
 689.\* Mr Levy: samples of compressed yeast.  
 690.\* Bainard's Business College: fine pen pictures.  
 691.\* Mrs T Corlett: 1 large case wax flowers, 1 music stand, and 3 panels fern painting.  
 692.\* F P Medina: 3 frames shell work.  
 693.\* Mrs C A Woods: 1 piece embroidery.  
 694.\* M MacDonald: display of Eureka stove-pipe.  
 695.\* Miss Ballard: 1 oil painting.  
 696.\* Loi Hing Lung & Co: 10 Chinese chairs 4 tea tables, 1 large tea table, 10 cushions, 2 chair covers.  
 697.\* Miss K Harrington: 1 beaded air castle.  
 698.\* Miller, Sievers & Co: display of hardy evergreens and plants, display of ferns, display of climbers, 1 palm tree, 1 hanging basket, display of cut flowers.  
 699.\* Mrs J E Cotter: 1 basket of wax flowers in glass stand.  
 700.\* D Bruce: 1 show case of hooks.  
 701.\* Blackmar & Davis: 4 Roger's pianos.  
 702.\* I Duffy: display of rustic chairs, sofas, summer houses, vases, hanging baskets, etc.  
 703.\* Miss K L Cole: display of paper patterns.  
 704.\* I N Choynski: old hooks, Rool of Lapil-linus, antiquarian pen and lead pencil.  
 705.\* Holcombe Bros: Carriages. Names—coupelette, landaulette, coupe, rockaway, phaeton, open huggy, and top huggy.  
 706.\* A P Adams: compressed coffee.  
 707.\* Jafferis & Co: display of water-proof crape and lace.  
 708.\* Woodward's Gardens: one oil painting.  
 709.\* D H Jaccard: one model patent door hinge, one patent pin wheel escapement for watches.  
 710.\* Louis Dampf: passe partouts and gold frames.  
 711.\* Francis Smith: wheel harrows.  
 712.\* Mrs E D Lanes: four paintings, three crayons, water color.  
 713.\* Woodward's Gardens: one single specimen of variegated foliage, display of pines, bycops, display of tropical plants, one palm tree.  
 714.\* Thos A Garey: one lot of Garey's Mediterranean sweet orange, and three jars of sample fruit.  
 715.\* McCarthy & Dodge: one lot of elastic stamps.  
 716.\* Birchhoff & Specht: one lot of sunlight printing, maps, drawing of all kinds.  
 717.\* Johnson, Clark & Co: one dress doll.  
 718.\* Vincent Ferraiola: three crayon portraits.  
 719.\* J Renz: one lot of bitters, one lot of blackberry brandy, one lot of Bonanza Bourbon whisky.  
 720.\* H C Langrehr: two mechanical drawings.  
 721.\* B R Prince: one show case of cocoons.  
 722.\* Wells, Hope & Co: display of patent metallic signs.  
 723.\* H W Vaughan: Vaughan's patent photograph.  
 724.\* C H Dodge: display of Dodge's oriental pearl renovator.  
 725.\* David J King & Co: display of patent fountain pens.  
 726.\* M Munion (Sac.): display of peaches.  
 727.\* R B Blowers (Woodland): display of grapes.  
 728.\* B F Flint: one glass case of wool.  
 729.\* Arnes & Dallam: display of Japanese paper oil cloth, carpeting and rugs.  
 730.\* Harishorn & McPhun: display of window shades and opaque shade cloth of California make.  
 731.\* C D & E Hinkley: display of "Star Clipper" spring beds.  
 732.\* Mrs J E Colton: one white wax cross in glass frame, one case of wax fruit, one case of wax magnolia, one frame of autumn leaves, exotic.  
 733.\* N C Mayo: Wait's patent horse feeder.  
 734.\* A L Bancroft & Co: thirteen frames containing specimens of job and label printing, and lithographing.  
 735.\* Mrs H Suttin: two glass show cases of embroidery work.  
 736.\* Miss Swanson: display of ladies' underwear, dress chart.  
 737.\* E H Marwedel: one case of upholstery goods, and stair rods.  
 738.\* Madam Lettreby: one large show case of rice and paper flowers, eighteen shades of paper and rice flowers, one decalcomania picture in leather frame, three decalcomania pictures in frames, three leather frames of paper flowers, three shades of crosses and harps (imitation of Parian marble), one frame card work, one shade containing stone cross and wax wreath.  
 739.\* Thos Saywell: display of begonias, display of cutflowers, display of roses.  
 740.\* Chenery, Souther & Co: 20 dozen of Bennett's Wild Cherry stomach hitters, 4 dozen of California orange bitters, 20 dozen of Dr. Abernethy's green ginger brandy.  
 741.\* W Halkett: 2 light buggies and 1 wagon.  
 742.\* Blunt & Chapman: 1 case containing specimens of natural history.  
 743.\* Menzo Spring: 1 case containing samples of artificial limbs.  
 744.\* Mrs M Morrow: 1 dress cutting chart.  
 745.\* Mrs J B Walter: display of hair restorative.  
 746.\* R W Hathaway: one frame hand point lace work.  
 747.\* Hill & Beebe: display of chemical wonder.  
 748.\* Warner & Hill: display of the "Lightning Eraser."  
 749.\* W F Bailey: one glass case wax flowers.  
 750.\* W K Vanderslice: 1 case quartz jewelry.  
 751.\* G Simonds: samples of Simond's patent night light.  
 752.\* J W Evans: 6 Domestic sewing machines, 4 Grover & Baker sewing machines, 2 cases Domestic paper patterns.  
 753.\* C Deaves: specimens of poster engravings executed on pine.  
 754.\* Wm Jones: encaustic and plain tile pavement, wainscot and hearth, tile and hand painted cut tile.  
 755.\* Falkner, Bell & Co: 2 cases wool.  
 756.\* A Yeoman: 6 small cases containing specimens of natural history.  
 757.\* H F Stevens: display of Pacific coast woods.  
 758.\* J H Gilmore: 1 artificial incubator.  
 759.\* J B Owens: display of iron stone sewer pipe and chimney flues.  
 760.\* S F Journal of Commerce: display of California products, fruits, vegetables, grains, etc.  
 761.\* T G Cockrill & Co: display of Bourbon whisky and J Bumgardner's old rye.  
 762.\* W W Hanscom: display of propeller wheels, one steam pump.  
 763.\* Hinkle & West: one steam governor.  
 764.\* Jos Neuman: display of silk cocoons, silk worms, eggs and raw silk.  
 765.\* Gustave Neuman: silk flags manufactured of California production, raw silk, one silk reeling machine, varieties of cocoons, etc.  
 766.\* S F Journal of Commerce, per George B Walker: display of California made paper and paper material.  
 767.\* Mrs Gerrish: two frames of point lace.  
 768.\* Mrs Kuhn: three frames containing wax wreaths and three containing wreath feathers.  
 769.\* Harmon Westerfeld: one block of compressed yeast.  
 770.\* E F Lorquin, three cases containing display of natural history.  
 771.\* Miss L Marks: one tatting bed set.  
 772.\* Minnie Schnugrass: display of artificial flowers.  
 773.\* J C Wingate: one patent land roller.  
 774.\* Mrs J D Treat: one frame containing transfer pictures.  
 775.\* Kustel & Hoffman: one gold amalgamator.  
 776.\* G Kustel: display of electric galvanic art work.  
 777.\* G M Pease: one new apparatus for fractured clavicle.  
 778.\* G H Miller (apprentice): one architectural drawing.  
 779.\* R F Rochiccoli: two show cases containing samples of galvano-plastic work, display of bronze statuary, two "Centennial" champagne faucet standers.  
 780.\* Gen Geo Deitzler: display of dried fruits, dried vegetables and California raisins—Alden process.  
 781.\* West Coast Furniture Co: four sets of bedroom furniture, one set of dining room furni-

ture, fine assortment of chairs, four easy chairs, two spring mattresses, general display of furniture of California make.

782.\* Miss Lizzie Oppenheimer: one shade of wax flowers.

783.\* H. Westerfeld: one bottle of high wine and one bottle of double refined spirits.

784.\* E. Pardini: display of leather.

785.\* R. Fenkhausen & E. W. Levy: one model of wire rope railroad.

787.\* W. H. Murray: display of California tobacco leaf and California salt, one urn of California polished granite.

788.\* Mrs. N. J. Healy: one shade containing urn of wax flowers, one wax wreath, one wax cross, one frame worsted work.

789.\* G. M. Grant & Co.: one sample barrel and two cases of "Elaine" oil.

790.\* Thos. Tweedale: collection of South Sea Island curiosities.

791.\* Mills & Leak: display of kid and buck gloves and gunnits.

792.\* Miss Fannie Mc Masters: two frames embroidered crochet work.

793.\* R. E. Campbell: twelve patent duplex spring beds and bedsteads.

794.\* F. T. Newbery: two maps of the City of San Francisco.

795.\* Dewey & Co.: two bound volumes of the WEEKLY MINING AND SCIENTIFIC PRESS, and WEEKLY PACIFIC RURAL PRESS, five different sizes of Dewey & Co.'s patent elastic hinge newspaper file holder. Also (for exhibition only) MECHANIC'S FAIR DAILY newspaper printing establishment, and J. M. Bassett's one cylinder Hoe steam printing press.

796.\* Wm. Beeman: one case containing a sample of elastic work truss abdominal supporters, pads, braces, etc., appliances for remedying curvature and other deformities.

797.\* Mrs. S. A. Kincaid: one crochet bed spread, one pair crochet pillow shams, crochet tidies.

798.\* West Coast Furniture Co.: display of wood and rattan baskets of California make.

### The Burleigh Tunnel.

This tunnel now penetrates into Sherman mountain a distance of 2,200 feet, and is still being driven in as fast as the Burleigh air compressors and high explosives, guided by skill and experience, can accomplish the work, which is at the rate of about two feet per day. Messrs. Loring, Nickerson and Green are the contractors, and they are progressing satisfactorily, though not as fast as they have done the past four months, on account of the increasing hardness of the rock. The holes are drilled with double-fluted drills from six to eight feet deep; the boring machinery is run back on the track about 200 feet and the blasts exploded. The gases resulting from the combustion of the giant powder are highly noxious, but the deleterious effects are more likely to be felt a distance of 200 feet or more from the heading of the tunnel than right up at the breast where air is supplied by the compressors.

Twenty lodes have already been intersected by this colossal prospecting enterprise, two of which have been worked extensively, and immense quantities of ore have been taken out. The principal lode, as yet discovered, is the New Era, which generally carries a body of solid ore from two to three, and in some places as much as four feet in thickness. This, however, is of low grade, but owing to the increasing facilities for transportation and treatment of this class of ore, it cannot fail to prove highly remunerative; indeed, a vein half the size of this would be a bonanza in any other place than Clear Creek county, where silver is the ore that is most particularly sought after and devoutly wished for; but the time is not far distant when many of the mines in this county that have not been touched for years will be actively worked for the lead they contain and will yield handsome profits to their owners.

The New Era was cut 920 feet from the commencement of the tunnel, and has been opened out by drifting 250 feet each way. Fifty feet west from the tunnel a winze 40 feet deep has recently been sunk, and a drift is being run west from a point in the shaft 35 feet below the tunnel level. This will open up a stope carrying a vein of galena of incredible size, and undoubted permanency, the upper edge of which forms the floor of the drift above. This lode is fourteen feet in width, dips to the north at an angle of 35°, and its course is nearly east and west.

The Rider lode is 1,700 feet from the tunnel's entrance, and has been explored some, though nothing like the New Era. We did not examine this vein, but Mr. Loring, the foreman, to whom we are indebted for much valuable information and a ride on the car from the breast to the mouth of the tunnel, informs us that a drift has been run east on the lode 40 feet, and another one west 80 feet.

We have confidence to believe that the persevering efforts of the Burleigh tunnel company to discover something else will ultimately be rewarded, and we never know the day or the hour that we may be called upon to chronicle the discovery of the "biggest thing yet" by this company in the unexplored interior of Sherman mountain.—*Colorado Miner.*

### Newspaper Fileholders.

Dewey's new elastic fileholders (black walnut), size of the PRESS, Harper's Weekly and Scientific American, for 50 cents. Larger sizes to suit any newspaper, 75 cents. By mail, postpaid, 10 cents extra. Cash with all orders. Patent allowed. Address, Dewey & Co., Publishers, San Francisco.

## Facts for Pacific Coast Inventors.

MINING AND SCIENTIFIC PRESS,  
PATENT AGENCY, S. F.

Our reputation as Patent Solicitors has been obtained by long experience, painstaking in our work, and fair dealing with our clients. We charge reasonable fees and do our work well. We charge for each case according to the amount of work involved. Our cases are prepared by members of the firm who have been in the business over twelve years, and we do not intrust the preparation of cases to boys or employees. A firm that employs boys at five and six dollars per week to write specifications, can afford to advertise and take cases at a uniform rate of \$20 or \$25 a case, but the inventor does not usually find it the cheapest plan to employ such aid. If it is worth a hundred dollars to prepare a case and secure a patent, we charge a hundred dollars. If we can afford to do the business for twenty dollars, we only charge that much. A blacksmith might as well advertise that he will do all kinds of jobs from the shoeing of a horse to the ironing of a wagon for one price, as for a patent solicitor to say that he can prepare and prosecute all kinds of cases (and do them right) for any one fixed price. It is not common sense. And if we were the inventor we should at once distrust the agent who made us the proposition. We would think that he was in the habit of slighting his client's work. If a person will send us his model, so that we can see what we have to do, we will tell him what we can do his work on that case for, and we always satisfy our clients. We have succeeded in securing the patronage of every inventor who has taken his work from Eastern agents and given us a fair trial. We do the work better and more promptly. The inventor can come and see us and explain matters orally, if an explanation is required, and if we make a mistake or fail to do our duty, he can always reach us with a "long-enough pole."

## Buy the Best.

Before purchasing an American Watch, examine the different styles manufactured by the NEW YORK WATCH COMPANY, at Springfield, Mass. They are the latest and best improved manufacture. You can depend upon them for fine finish, durability and perfect time. They are sold at favorable prices—in fact, no higher than many of the inferior styles. Examine into the merits of this Watch before you buy any other. Our word for it, you will not regret it.

DEWEY & JORDAN, Agents,
